The last time I was in New York, Col. Weld, who has always taken much interest in the so-called Mapleshade flock of Cotswolds, remarked: "They tell me you are reducing their size."—"I do not think it is true," I replied, "but it depends on what you mean by reducing their size. If you mean that I am not aiming to breed sheep that at three and four years old will weigh 400 lbs., it is true. I do not want such sheep. But if you mean that I am reducing the amount of wool and mutton in my lambs and yearlings then it is not true. I am aiming to breed sheep that are intrinsically good—good for the purposes for which they are kept, and not good merely to attract attention in the show-yard."

"Thee writes," continues my Virginia correspondent, "in reply to 'R. P. W.,' of Nebraska, in No. 123 of Walks and Talks, that thee keeps about a half dozen Merino ewes to raise lambs for thy own use; are not Cotswolds as good, or why does thee keep Merinos for that purpose?"—For this reason: The Cotswold ewes cost from \$75 to \$100 each, and the Merino ewes I bought for \$2.50 each. I have never killed a pure-bred Cotswold lamb, but imagine it would not be bad eating. The grades are good enough for a farmer, and much better than any lamb I can buy in market. With a little mint sauce and a dish of green peas picked fresh from the garden, a grade Cotswold-Merino lamb that will dress 40 or 50 lbs. is decidedly good eating after you have earned your dinner in the hay-field.—"This is all true enough," says the Deacon, "but 'W. W.' probably means to ask if you would not get better lambs from common long-wooled sheep crossed with a Cotswold ram than you would from common Merino ewes?"—You might get better lambs and you might not. It depends on the feeding. The Squire got a lot of long-wooled sheep in Canada, and bought a pure Cotswold ram from me. His lambs, now a year old, will not average over 60 lbs. live-weight.—

"That is so," says the Deacon, "but it does not say much for your pet theory about using thorough-bred male animals to improve our common stock."—"I will not argue that matter with you, Deacon," I replied, "and I do not want to make the Squire angry by telling how he has fed his sheep. I have scales in the barn, and if you will go with me we will weigh some of our grade ewe lambs, now (April 15th) from eleven to twelve months old."—"All right," said the Deacon, and we got the shepherd and drove the sheep into the barn.

"Now then, Fred," I said, "the Deacon wants to see if your grade lambs will weigh as much as the Squire's. Pick out a good one." He did so and put her on the scales. She weighed 118 lbs. "Now catch another;" 119 lbs. The next weighed 101 lbs. "Now catch some of your thorough-bred Cotswold ewe lambs." The weights were 123, 122, 125, 135, 129, 137, 125, 125, 109, 104, and 101 lbs. The last one had a magnificent fleece of fine lustrous wool, from 12 to 14 inches long, and though the lightest lamb in the flock is certainly not the poorest. "But tell me," said the Deacon, "did you not once say in the *Agriculturist* that the Cotswolds were the largest breed of sheep in the world, and that if a man had a small one it must be a grade?"—"No. I never said anything of the kind. I should be much more likely to say if you have a sheep of great size he must be a grade or a cross-bred."

"Won't you weigh the ram lambs?" asked the shepherd, "it will not take long." He evidently wanted the Deacon to see them weighed. The first one weighed 145 lbs.; then 142 lbs. "How old is this one?" asked the Deacon.—"He was dropped May 3d, 1873, and is about 11½ months old."—"He is a good one," says the Deacon.—"We have some bigger ones," remarks the shepherd, "and I was allowed to feed them only a little grain and no hay until the 1st of March."—"Bring on your next," I said; "the sheep never did better, though they have been wintered on pea-oat-straw, bran, and mangels. I am not ashamed of them."—"Here is a good one," said the Deacon.—"Yes, splendid fleece, but his long wool makes him look larger than he is."—He weighed 157 lbs.—"Now handle them and pick out the heaviest. How much?"—"179 lbs."—"Try another."—187 lbs.—"That will do; if you get a heavier one the Deacon will think it is not thorough-bred."

"How much will such a sheep dress?" asked the Deacon.—"Divide the live weight by 7 and that will give you the dressed weight per quarter. $187 \div 7 = 26\frac{2}{7}$ lbs. per quarter. Now pick out your best yearling ram and that will do."—"He is a noble-looking fellow," remarked the Deacon.—He weighed 253 lbs. I could put another 100 lbs. on to him by next fall, and make him dress 50 lbs. per quarter. But who wants such mutton? Tallow is cheap.

"Don't you want to weigh 'fourteen-pounder'?" asked the shepherd.—I explained to the Deacon what he meant. "We weigh all our lambs as soon as born and keep a record. We had one pure-bred Cotswold ram lamb that weighed when dropped 14 lbs. He is now one month old. How much will he weigh? But never mind guessing. Balance the scales accurately. Keep him still a second. How much?"—"33 lbs."—"Animals eat in proportion to live weight," say the authorities, and a gain of two per cent per week is fully up to the average on a sheep over a year old. That is to say, a sheep weighing 100 lbs. will on good feed gain about two pounds a week. But this lamb

has gained over 20 per cent per week on its average live weight. We then weighed a pair of twin grade lambs that will be a month old to-morrow. They weighed when dropped 10½ and 9½ lbs. They now weigh 27 and 24 lbs. This is a gain of over 22 per cent per week average live weight. In another month these two lambs will together weigh more than their mother. We have another splendid grade ewe lamb that has two crosses of Cotswold blood in her. Weight when dropped 10½ lbs. At a month old, two days ago, she weighed 29 lbs. To-day, 30½ lbs. Her Merino grandmother, at four years old, probably weighed about 70 lbs. So much for good blood—"and good feed" added the Deacon.

"Now weigh the heifer calf and we will stop." This calf was born August 7th, 1873. Small at birth, but pretty. Dam, a native; sire, full blood Shorthorn; weight, now at eight months and eight days old, 420 lbs. Feed during winter, clover hay and raw mangels, with a little skimmed milk when we had it to spare, and a liberal allowance of bran and oats.—"She will go ahead when she gets out to grass," remarked the Deacon.—Yes, and that is one reason why I think, for me, it is better to have calves come in the fall than in the spring. We have been making butter all winter, and by the time the cows begin to slacken in their milk we shall have a good bite of grass to start them on again. In July and August, when the pastures are burnt up and the weather not favorable for butter-making, the cows are dry, and will calve in time to get the benefit of the rich fall feed. In winter you have time to give them the best of care. You can steam the food and not feel that your labor is wasted, as the full flow of milk pays handsomely as you go along. I do not cook the food, but we feed mangels liberally and give two quarts of bran and two quarts of corn-meal per day to each cow. If the cows will not stand such feeding you do not want them—but the butcher will, for they will be fat at a time when beef brings the highest price, say in May or June.

"Now, Deacon, let us go into the house again and look over our letters."

Here is one who writes from Virginia: "I would like to ask your opinion of a plan I have thought of trying with a portion of a field that is to be sown to wheat this fall. Instead of sowing it to oats, as is our custom, and hauling out the manure into a large heap to rot during the summer, I propose to draw out the manure this spring and spread it on the land, and then incorporate it with the soil by plowing and harrowing during the summer to kill the weeds."—"In other words," said the Deacon, "he proposes to summer-fallow instead of sowing oats, and to apply the manure now in the fresh state instead of rotting it and applying it to the fallow in the fall. I think it is a capital plan."—If the manure could be kept in a properly managed heap, so that it would ferment without loss, I think he would get more wheat by spreading the well-rotted manure on the surface of the fallow after the last plowing, and harrow or cultivate it well in. But with carelessly made heaps I have no doubt there is considerable loss of ammonia, and in such a case it would be better to adopt the plan he proposes. One thing is fully proved by Mr. Lawes's experiments on barley and wheat, that when barn-yard manure is plowed into rather heavy land it decomposes so slowly that we do not, for some years at least, get half the benefit from it that the plant-food it contains is capable

of producing. I wrote to Mr. Lawes, telling him that John Johnston and some of our best farmers claimed that they got far better crops by spreading the manure on the surface of the land and letting it lie exposed for several months than they did when it was plowed under. He replied: "I have no doubt that the farmers are quite correct in what they say, as exposure to the air and rain for so many months would set free many of the ingredients of the dung."—"He means," said the Deacon, "that they would be set free and evaporate into the atmosphere, which is precisely what I think."—No, he means that they would be set free and be carried into the soil by rain, and produce a better effect than when plowed under in the fresh state. The soil is so conservative, that when it once gets hold of manure it tries hard to keep it. If you should take a field of clover with a crop on it equal to two tons of hay, plow the crop under on half the field, and mow it on the other half and remove the hay, and then plow it up, and in due time sow the whole field to wheat, what have you done? You have made one half the field 100 lbs. per acre richer in nitrogen than the other half. Now this 100 lbs. of nitrogen is as much as is contained in 70 bushels of wheat and its usual proportion of straw. But does any one suppose that this half of the field will produce, even if we should sow the whole field to wheat for two or three years, 70 bushels of wheat per acre *more* than the other half? And if not, why not? We know that if we could convert this nitrogen into ammonia and nitric acid, and apply it in proper quantity, it will produce a far greater increase of wheat, barley, oats, and grass than when applied in its organized condition. So much we know. But how best to attain this object is yet to be determined.

Mr. Isaac Stickney, of Woodhull, Ill., favors me with samples of wool from his pure Highland sheep and from the half and three-quarter grades. I had supposed that these sheep were best suited to mountain regions, but Mr. S. says he has had them now for six years on his farm in Illinois, and they are very healthy. The soil of the farm, judging from a sample which Mr. Stickney sent me for analysis nineteen years ago, is rich, remarkably fine, and abounding in organic matter—better suited, I should have said at that time, for corn growing than for sheep breeding. Mr. S. has about 900 acres, and he says there is not an acre of waste land on the farm. It is a beautiful rolling prairie. Mr. S. keeps over 100 head of cattle, and has two pure-bred Shorthorn bulls, 100 Highland sheep and grades, 10 horses, and 180 hogs of last year's stock, "mostly," he says, "of the black Berkshire and Poland, so called—a mixed up breed which I never have found a person that could tell what races they were composed of." This so called Poland-China breed originated in Butler and Warren Counties, Ohio. The last cross, Mr. Milliken tells us, was a Berkshire, and consequently they must have at least fifty per cent of Berkshire blood in them. Mr. Stickney was one of the earliest importers of Suffolk pigs, but he says he has given them up, as their thin skin and light hair render them unsuited to the prairie wind and hot sun. He now proposes to try the Essex. I must confess I can not see why a white pig will not stand the sun and wind as well as a black one, but certainly Mr. Stickney can have no prejudice against the Suffolks.

Hardin Co., Ky. He has a farm of 75 acres. Hay sells for \$14 per ton; corn 40c. per bushel; wheat 90c.; oats 20c.; early potatoes 75c.; late potatoes 50c. per bushel, and cabbages 4c. per head. He asks, "What crop would pay best? Would it be better to keep stock? if so, what kind? Will it pay to subsoil?"—I have not much faith in the immediate benefit of subsoiling, but it would be well to try it on an acre or two. At the prices named, potatoes and cabbages ought to pay better than any other crops. But it is necessary to make the land rich, and this can only be done by keeping stock and making good manure. I am inclined to think that for a few years to come "H. L. W." would find pigs more profitable than any other stock.

"H. B. G.," of De Kalb, Ill., writes: "In your work on the pig, page 141, is a table giving the value of manure in producing 100 lbs. of pork from different kinds of food. The valuation is evidently too high for Illinois. What would be a fair basis for this State? Corn is worth 50c., oats 40c. per bushel; timothy hay, delivered, \$7.50 per ton."—This is a very difficult question to answer. The table is correct, so far as it goes. It shows accurately the comparative value of manure obtained from different foods. In other words, if the manure from a ton of wheat straw is worth \$2.68, then the manure from a ton of meadow hay is worth \$6.43, and from a ton of clover hay \$9.64, and from a ton of corn \$6.65, and from a ton of peas \$13.38. If the manure from a ton of straw in Illinois is only worth \$1.34, or half the above estimate, then the manure from the other foods will only be worth half. The actual money return from the application of manure to land depends a good deal on the price obtained for the crop. If you were raising onions or potatoes at 50c. to 75c. a bushel, manure would be worth fully the price given in the table. With wheat at \$1.75 per bushel, and hay \$25 per ton, I think the table is not too high. But if you are raising corn at 25c. a bushel, manure would be worth very little—or land either. Timothy hay, delivered, at \$7.50 per ton, can not be a very profitable crop, especially considering that its removal from the farm tends to impoverish the soil. Whatever manure may or may not be worth, it seems certain that those farmers will ultimately make the most money who feed out to good stock all the hay, corn, and oats they raise rather than to sell them at the above prices. I would, however, rather sell oats at 40c. per bushel than hay at \$7.50 per ton. Here, it costs me \$2.50 per ton to deliver hay, but we get \$25 and over per ton for good timothy. This pays very well, provided you bring back a ton of bran for every ton of hay sold.

When and How to Go West.

Much unnecessary suffering and disappointment may be avoided if those who have determined to go West should know exactly what difficulties they will meet with and what obstacles they will encounter. It profits little an empty-handed man to stand upon a soil as fertile as may be, and it is an aggravation of his poverty that the air he breathes only invigorates an appetite which he has nothing to satisfy. Labor is a drug where every man is a laborer, and where one's neighbor is as poor as himself. Yet the temptation of a free homestead attracts many men with dependent fami-

lies into situations where without available means poverty becomes actual destitution. Besides, the most available homesteads are now occupied, and the further from a railroad and a town a new settler is, the more helpless he becomes. For this reason we would dissuade the settler who depends upon his labor for his living, and who can not afford to remain idle for a year or two, from going any farther than the point where he can secure work. The man who can take \$1,000 or more along with him is independent of circumstances, if he has only wit and smartness sufficient to keep himself from making glaring mistakes. All other men, as a rule, would find it better to keep from the frontier and remain where they are, or not to go so far out, but seek those places where land is still cheap and where their labor can be made available. For the man with some money, the lands remote from the railroads are not the best. He may there procure a homestead free, but its actual cost in the five years needed for its acquisition will be more than that of a tract near the railroad, even if it be bought at \$10 per acre. The time lost in going back and forth for supplies, and in marketing his crops, will soon amount to the value of 160 acres near a town at \$10 per acre. The comfort to him and his family of being near a town will be an important consideration. If he is not suited there will be many chances to sell out to new comers, but in the back country he can not do this; he must simply stay there or abandon his improvements. Now is the season to go West. About this time last year we saw a farmer from Missouri arrive upon a tract in Reno Co., Kansas, which he had purchased from the railroad company, and his mode of procedure struck us as so business-like and successful that we describe it as a model. He arrived with two covered wagons, in which he had his family, his household goods, some plows, and other implements. As he drew up upon his lot, which he had previously selected and staked out, he hauled a plough out of one wagon, and, unhitching the team, hooked on to the plough and commenced breaking the sod. His two boys tethered the cows, brought out a tent and pitched it, set up a stove, and the old lady began housekeeping. The family arrived early in the morning, and as we returned past their camp, in the afternoon, there were two ploughs at work; a hedge-row had been broken around 160 acres, and the teams had already commenced breaking a 40-acre lot for corn. The old gentleman told us he intended to break 80 acres before he stopped to build his house. If every one who went to the West was so well prepared as this man there would be fewer disappointed settlers. All the hardships incident to such a life must be submitted to patiently and willingly, or the man who goes West had better have stayed at home.

Making Drain Tiles.

In places where there is a supply of clay, and which are so distant from a manufactory of tiles that the freight is too costly for their profitable use, it would be better to manufacture them where they are to be used. If the quantity to be used is not more than one or two hundred thousand, a cheaply constructed hand machine can be used. Where larger quantities are desired, some of the various horse-power machines costing from \$250 upwards would be more suitable. A very effective hand machine is shown in the annexed en-

Here is an interesting letter from "H. L. W."

graving, fig. 1, which can be made by any mechanic, and which is capable of making 300 tiles per hour. It is a wooden box divided into two compartments; in the rear one there is an upright post by which the machine may be bound to a tree or a firmly planted fence-post. A lever is hinged to the upper part of this upright post and is attached to a plunger which fits into the forward compartment of the box. At the front of this compartment the dies, shown at fig. 2, are fastened into an opening. The clay, already tempered and worked until tough and plastic, is shoveled into the box;

Fig. 2. DIES.

the plunger is brought down by the lever and the clay is forced by the pressure through the dies. The tiles thus molded are run out upon a table which rests upon rollers, and which moves forward with the tiles. A fresh supply of clay is put into the box, the plunger is again brought down and the tubes of clay make another move forwards. When the table is filled a frame upon which fine brass wires are stretched is brought down upon the tiles and cuts them into proper lengths. The dies are made of an iron plate, the central core is held in its place by a bent crossbar of iron. Various dies, of course, are needed to suit the different sizes of the tiles. The inside of the die-plate is shown at fig. 2.

As the tiles are cut they are picked up by a boy with the pronged holder seen lying upon

Fig. 1.—TILE-MAKING MACHINE.

the ground near the machine in fig. 1. The prongs should be as long as the tiles and should fit them closely, so as to prevent any injury in removing them. They are carried upon the holder to a level drying ground or are placed upon racks to dry. When dry they are laid up in a kiln to be burned.

Poultry Farming.

There is something alluring in doing things upon a large scale. The desire to possess a thousand fowls has enticed many men to go into poultry farming as a special business, and indulge in dreams of an easy and comfortable business if not of wealth. Unfortunately in nearly every case which has come to our knowledge, there has been failure, at first disappointment, then disgust and sickness of heart from the hope deferred, rather than from any inherent impossibility of keeping a thousand fowls as easily as a hundred. It would seem as though a person who could successfully manage one small flock could manage several with equal success, but in reality few persons manage a flock of a hundred fowls with com-

plete success. There are deaths, sickness, wormin, losses of eggs, hidden nests, and the loss of broods, depredations of hawks, owls, skunks, or cats, and all the other ills from which poul-

HILL-SIDE POULTRY-HOUSE.

try suffers by reason of neglect or want of skill in the great majority of small flocks; but because of the small value involved nothing is thought of these losses. We always hear, however, when a man fails in his endeavor to man-

age a poultry farm. The cause of the frequent failures is not the impossibility of succeeding, but the want of the care, skill, and patience necessary for success. With these qualifications, a suitable locality, and a proper arrangement of buildings, we know of no reason why poultry keeping for eggs and chickens should not be made profitable with the use of a moderate capital. We know of a case in

which it was successful so far as it was carried, and have no doubt that it might have been indefinitely enlarged with equal success. For the information of those who have requested such information, we describe the plan.

The farm was a tract of cheap land, rough, hilly, and with too many large stones in the soil for cultivation. There was some young, second growth of timber upon the hill-side and a spring broke out near the foot of the hill. Excavations were made in the bank and log houses built therein, all but the front being covered with earth. The houses were 18 feet long by 12 wide, and about 6 feet high to the eaves. The roof was of rough boards, and a large ventilator was placed in the center of it. The arrangement is shown in the accompanying engraving. The soil, of coarse gravel and very dry, was left to form the floor of the house. Roosts for one hundred fowls, and boxes for nests were put in each house, and in the space of twelve feet or thereabouts left between the houses, some places were fitted for nests with logs and earth. The houses were whitewashed inside and outside. The water of the spring was brought in a half-inch lead pipe near to the houses and ran into a trough. Two

hundred hens were kept in the two houses without any trouble, and were free from lice and all disease when we last saw them. They had a range over seventy-five acres of ground, which

was only partly in a poor sod, the rest being gravel or sand with a plentiful growth of blackberries and dewberries. Corn, barley, oats, and wheat screenings were used for food, and the young man who owned and ran the farm was well satisfied that he could add more houses year by year until his hill-side was fully occupied, and still succeed. The warmth of the underground houses kept the hens laying through a greater part of the winter when eggs were selling at a high price. The fowls were common native ones which were purchased from

the neighboring farmers, but they were all pullets of the previous year. To this fact as well as to the care and tact with which they were managed, the success was probably in a great measure due. To the numerous inquiries now before us relating to this business we would say, that if some such plan as this were followed upon a piece of cheap land near a village or city which would furnish a market for fresh eggs in the winter at not less than twenty-five cents a dozen, and for early chickens at not less than twenty-five cents a pound, with proper care, close attention, a watchful eye, and quiet patience with the wayward flock, a reasonable profit might be made out of a small investment.

Unloading Corn-Ears.

"J. S. B.," Nebraska City, describes a plan of unloading corn-ears which we illustrate in two engravings. The labor and the time required to unload a large crop of corn-ears, with the help of a common scoop shovel only, are very great, and some means are needed whereby

UNLOADING CORN FROM WAGON-BOX.

a whole load may be elevated and emptied into the crib. The following plan of doing this is described by "J. S. B." Where there is a double corn-crib, several hooks are fixed to the rafters at their junction at the peak of the roof. A set of blocks and tackle is suspended to

either of the hooks, the rope from which passes beneath a pulley or roller at the bottom of the crib. Rings are fixed to the sides of the wagon-box, and rope slings are made provided with hooks to fit these rings. When a load of ears is brought from the field the slings are hooked to the rings of the wagon-box and to the lower

Fig. 2.—UNLOADING CORN-EARS.

block of pulleys, and the team is hitched to the rope. The whole load is then elevated, and when high enough the box is turned, the end board loosened, and by means of a hook the rear end of the wagon-box is fastened to the crib. The team being carefully driven ahead, the front of the box is raised and the corn is shot out into the crib. If there is only the common open crib usual in the Western corn regions a frame of poles may be erected to which the hoisting tackle may be fastened. To adapt the plan to a small corn-crib we suggest the contrivance shown at figures 2 and 3. It is to provide boxes which fit in pairs upon the frame of the wagon instead of a wagon-box. Rings are fastened to the sides of the boxes. A floor with low sides and ends is made to receive them. As the corn is gathered the baskets are emptied into the boxes, and when the whole of them are filled they are taken to the crib. Here they are hoisted one by one by means of a rope passing over pulleys (as hay is hoisted on a hay-fork), and emptied in at the door of the crib. One side of the box is made sloping and projecting, so that the corn is readily dumped, the sloping lip resting upon the sill of the door of the crib. If the boxes are made twenty inches square and twenty

Fig. 3.—BOXES FOR CORN-EARS.

inches deep they will hold about three bushels of ears each. Fourteen boxes of this size can be used in a space of twelve feet. If the wagon-box is of that length, a load of over forty bushels may thus be drawn at once. If the wagon is made to contain sixteen of the boxes about fifty bushels may be drawn at a load.

FRAUDULENT BUTTER.—From the outset we have discouraged the manufacture and sale of the so-called "suet butter" as a fraud upon the consumer as well as the dairyman. In no sense can the stuff be called butter, and we are glad to see that at last the sense of the dealers in

butter is aroused, and that a demonstration is making against "oleo-margarine," or fat, suet, tallow, or whatever it may be, churned in sour milk and packed and put upon the market as butter. In just so much as this fraud may be perpetrated is the market value of butter depressed in the market. Because as there is an established market for butter of poor grades amongst poor consumers and bakers in the cities, anything which may dispute the position in the market of this class of butter makes it unsalable, and affects the entire market by an accumulation of stock. Therefore factory-men, dairymen, and even makers of the "gilt-edged butter" are directly interested in preventing this stuff from coming upon the market as butter. Let it be sold for what it really is—a preparation of tallow; this the makers of it have a perfect right to do, but when it enters the market as butter of any kind it usurps a place to which it has no right, and becomes a fraud and a thing to be discouraged. The New York Butter and Cheese Exchange has at last determined to interfere to protect the interests of their clients, and to obtain such legislative action as shall enforce the use of a proper and descriptive brand upon this spurious article, and to deny it a position of any character whatever amongst dairy products.

A Portable Fence.

By and by the interior fences upon the majority of farms will be abolished. As farmers learn the value of economy they will no longer

A PORTABLE FENCE.

submit to the enormous wastes caused by these fences, and will either fence their pastures only, or use portable or temporary fences which can be readily taken down, moved, and replaced elsewhere. We give here an engraving of a hurdle fence which is made of panels of light poles, strips, or boards, and which are connected together by means of wire rings or loops of light rope. They are placed in a zigzag position so as to support each other, and each panel may be used as a gate as occasion may require.

CONSUMPTION OF FEED.—

A horse will consume 18 lbs. of hay and twelve quarts of mixed oats and corn, ground into coarse meal, per day. A cow will need 18 lbs. of hay and 6 quarts of meal if she is milking. If at pasture three quarts of meal may be profitably fed per day. 100 hens will require 100 bushels of corn in a year, in addition to what they can pick up on their range. They will need very little corn in the summer, but at least a quarter of a pint a day in winter. The quantity of corn needed by a hog depends much upon its size, breed, and appetite, in all of which hogs differ very

much. It would be safe to allow half a bushel of corn, ground into meal, a week for a hog of 100 to 150 pounds, and more in proportion for larger ones. At fattening time there can be no limit given; the hog should have all it can be induced to eat or made to digest.

A New Harrow.

The harrow shown in the annexed engraving is one made by Messrs. Carr & Hobson, of Beckman street, New York. It is specially designed for strength and indestructibility—being

AN IRON AND STEEL HARROW.

made wholly of iron and steel—as well as for mellowing the surface, destroying weeds, and for evenly covering seed. As an implement for working either a summer or a fall fallow it is very effective, while for covering seed it is a far better implement than the common harrow, which leaves a large portion of seed upon the surface and covers another portion too deeply. The action of the teeth is to turn over the soil so as to cover the seed very evenly and yet leave the surface without ridges. Upon newly plowed sod it will also do excellent work. The teeth are of cast steel, sharp and very strong, and clear themselves so perfectly that nothing can possibly be retained upon them while the harrow is at work, so that manure may be evenly spread with the implement if desired.

A Convenient Farm-House.

"Subscriber" asks for a plan whereby he can build a small house to which by and by he can add a front, and thus secure as many conveniences as possible without unnecessary present expense. The plans here shown will probably answer the purpose. The detail may be altered to suit almost any circumstances, but as they are here given they were found very convenient as a farm-house for a small family

Fig. 1.—FARM-HOUSE COMPLETED.

by the writer some years ago. The part to be built first is the rear portion. This consists of four or five rooms, two below and two or three above with a wing containing a dairy and

wood-shed. The ground plan will be seen in fig. 2, attached to that of the front portion of the building. There is a hall between the two lower rooms with a staircase leading to the rooms above. A hall also separates the upper

Fig. 2.—PLAN OF GROUND FLOOR.

rooms. The right-hand lower room is intended for the kitchen, in which there is a sink and a pump, seen at s, from a cistern under the dairy. There is also a sink and pump in the dairy, seen at s. The dairy is entered from a door upon the covered porch and is provided with a chimney, so that a stove may be used to warm it in the winter. It should be placed upon the north side of the house. Behind the dairy is the wood-shed, having a door connecting it with the kitchen. Part of the upper hall is partitioned off and made to serve for two closets, one for each bedroom. A chimney is built upon each side of the hall from the ground upwards in which fireplaces may be made in each room; these chimneys connect beneath the roof and are brought into one stack above it.

When circumstances require the front to be built, it is added to the rear part. This portion consists of two rooms below and two above with halls and an open staircase which makes a turn as it enters the upper hall. The plan seen at fig. 3 shows the interior arrangements sufficiently without further explanation. The elevation of the building is seen at fig. 1. A porch runs along the front of the rear building, to which a glass door may lead from the front parlor. There are bay-windows in each of the front rooms and a covered porch protects the front floor. The size of the building and that of each room would of course depend upon the taste or necessities of the occupant. The house to which this description applies was 36 feet

Fig. 3.—PLAN OF UPPER FLOOR.

by 12, and 16 feet high in the rear part; the dairy and wood-shed were 20 feet by 12, and 9 feet high. The front part of the building was 36 by 18 feet, and 20 feet high. But the narrowness of the rear portion was a mistake and it should have been 18 instead of 12 feet. Almost always a person who builds anything makes the same mistake, and it is better to have too much room than too little both in houses and barns.

COMPARATIVE VALUE OF WOOLEN WASTE AND GUANO.—The waste of woolen mills is a very valuable fertilizer. Wool contains 17 per cent of nitrogen, equal to 20½ per cent of am-

monia, which is a larger proportion than most of the best guanos contain. But it is slow in its action, because the ammonia is undeveloped, or what is known as potential, and some years elapse before its full effects appear. It is therefore a lasting manure and very well fitted for permanent meadows. Its money value is difficult to fix, because it is very rarely sold here as a fertilizer. In England it brings in the market \$25 to \$50 a ton, according to its purity or freedom from grease and sand; at the same time guano sells for \$70 a ton. It is used as a top dressing upon grass, or is plowed in along with the clover sod for following crops. The liquid waste of a woolen mill should be composted with earth or spread upon grass.

front of the box is brought snugly up to the teeth of the cylinder. The roots are shoveled into the box at the top and are rapidly reduced to a fine pulp by the action of the sharp chisel points; the pulp is thrown out at the bottom of the box, where it is received upon an apron of plank, and from that it falls upon the floor or into baskets placed to receive it. A driving pulley is affixed to one of the gudgeons so that it may be worked by a belt from a horse-power. It is too heavy a machine to be worked by hand, although a small machine might be constructed upon the same plan if thought profitable to do so.

Raising Ducks.

It by no means follows, because ducks are a water-fowl, that much water is required to raise them. Yet this is a very common impression, and multitudes of farmers and villagers deny themselves the enjoyment and profit of a flock of ducks because they have no pond or stream near the house. It is true that adult ducks will get a good deal of their living out of a water privilege, if they have one. It is not true that water to swim in is essential to their profitable keeping. They want some range and grass and good fresh water to drink every day. Ordinarily, ducks can be profitably raised wherever hens can be. They make a pleasing variety in the poultry yard, and all who have room for them can enjoy them. The first thing in raising ducks is to get them out of the shell, and for incubation we decidedly prefer hens to ducks. They sit more steadily, and take much better care of the young. The wetting of the ducks' eggs daily in the last two weeks of incubation is even more necessary than for hens' eggs.

In a recent visit to a poultryman who has just started in duck-raising, he showed us five young Pekin ducks and six dead ducks, well dried up in the shells, from a sitting of twelve eggs. He had not learned the secret of wetting the eggs. This is sometimes done by sprinkling water upon them, but we think it better to take them from the nest and put them in a basin of tepid water about blood-warm. This moistens the whole shell without chilling the embryo life within. The ducklings out of the shell may be allowed to remain upon the nest with the hen for a day. The hen may then be put upon a grass-plat, under a coop, where the ducklings can go in and out at pleasure. Or if the hen is allowed liberty, the ducklings should be confined in a small pen from which they can not escape. A dozen in a pen ten feet square is enough, for the first two weeks. For water they only want a shallow pan—so shallow that they can not swim, and in which they can wade at pleasure. The water should be changed often and kept in good drinking condition. For the first food nothing is better than the yolk of hard-boiled eggs or boiled liver, chopped very fine. The food had better all be cooked for the first week. It may then gradually be changed to coarse sealded Indian meal, oatmeal, wheaten grits, or rice, as suits the convenience of the feeder. Bread-crumbs and sour milk are excellent food, as are angle-worms and snails. They are quite as good as chickens at devouring insects, and nothing seems to harm them but rose-bugs, against which they should be jealously guarded. For this reason they should be kept away from grave-vines and other plants specially attrac-

A Hook for Side Boards.

Frequently when drawing manure, stone, wood, or such coarse materials, it is not desirable to use a good wagon-box, but rough side boards or planks put in its place. Then these persist in falling down when they ought to stand up, and a person's temper is tried, and

HOOK FOR WAGON SIDES.

very often fails, with the usual results in such cases. All this may be prevented by using this simple contrivance. It consists of a ring of iron large enough to slip over the stake of the wagon-box and has a claw attached to one side. When the ring is on the stake the claw is placed inside of the plank or side board and holds it in position. Both the hook and its application are shown in the engraving.

Root Pulper.

The accompanying engraving shows the section of a root pulper which is readily and cheaply made, and which grinds the roots into pulp very rapidly. It consists of a cylinder of hard wood 16 or 20 inches in diameter turned exactly round and smooth, and of whatever length may be desired. This is mounted upon gudgeons and armed with steel teeth made of half-inch square steel. The teeth are ground to a chisel point and are screwed into the cylinder with the bevel of the points upwards and projecting half an inch. This toothed cylinder is fitted into a box of hard wood plank and the box is supported upon a stout frame which should be firmly bolted to the barn floor. The

ROOT PULPER.

five to these insects. As the ducklings grow older they may have more liberty and a greater variety of food. If they have not plenty of grass its place should be supplied by lettuce, onions, cabbage, or other green succulent food. If you desire exhibition birds of the largest size, it is particularly important that the ducklings should be fed regularly, and at frequent intervals, having all the food they can digest. Five times a day is none too frequent feeding. We have usually succeeded quite as well with ducks as with chickens in a village yard. When grown, we give them a larger range. *

Future Prospects of Wheat Culture.

It has now become a settled fact that in the future the wheat product of Great Britain will steadily decrease. The importations into that country the present shipping season will not be far from 100,000,000 of bushels. It is the demand for this vast quantity of grain that has kept up the price in our own markets to a profitable point; and it is the future demand that will govern the price of our wheat in the future. If that demand shall keep even with the surplus which we have to spare the price will be satisfactory; but if our production shall overrun the necessities of our foreign customers, the price will be so low that it will not pay the cost of producing it. The fact, therefore, that large tracts of land in Great Britain and Ireland have been withdrawn from wheat culture and have been turned into grazing fields and the production of meat, and that American fields are now looked to for the supply of grain, should not tempt us to go out of our way to largely increase our wheat production. On the contrary, our plan is to follow their example, to keep our wheat production stationary, and to increase our stock of beef cattle, sheep, and hogs, as much as possible, so as to supply ourselves and leave only a moderate excess for shipment. If Europe needs 100,000,000 bushels and we have but 90,000,000 to dispose of, the price of that 90,000,000 and that of all we need at home, in fact the price of the whole crop, will advance up to the extreme point that our customers can pay. But if we have but a small quantity over their needs the price of our whole production will depend upon what they are willing to pay. It would not then be wise to increase our growth of wheat, but rather to turn our attention to growing grass, and our meat and dairy products.

How to Manage Sitting Hens.

A good deal of the success of the poultry crop depends upon the management of the birds while sitting. Hens that steal their nests and follow their own instincts do very well if they are not disturbed, but frequently they get frightened or robbed, and the eggs are lost. As a rule, it is better to have all the sitting birds completely under your control, and make them follow your will rather than their own instincts. With a well-arranged poultry house it takes but a little time daily to have all the birds come off for food and exercise. But without this we manage to make the sitters regular in their habits. We usually set the hens near together in a sheltered sunny spot in boxes, or barrels, that we can cover, and thus perfectly protect them against enemies, and at the same time compel them to sit until the box is uncovered. Wherever they may lay, when they want to sit we remove them to the

hatching-yard by night, and put them securely upon a nest full of eggs. We usually take Asiatic fowls for mothers, as they are very contented upon the nest, and cover a large number of eggs. We have never failed to make them take kindly to a new nest. They also bear handling better than most other varieties, and are very patient, good - tempered mothers. Every day about twelve o'clock we remove the covers, and carefully take the hens from their nests for food and water. In pleasant weather they have from a half hour to an hour to scratch in the dirt and take their dust bath. Most of them return to their nests voluntarily before the time is up. Occasionally a bird will take to the wrong nest. It takes but a few minutes to see every bird in her place, and make her secure for the next twenty-four hours. As the hatching time approaches, we dip the eggs in tepid water every day to keep the pores open, and to facilitate the hatching. This moistening of the eggs we have found of special service in the hatching of the eggs of water-fowl set under hens. By this method we have good success with sitting hens. *

A Corn-Marker.

The annexed engraving is one of a marker for corn or potatoes which we recently saw in use. It is a very light, neat, and useful implement for those who plant these crops by hand in check rows. The markers are strips of plank four feet long, two inches thick, and six inches wide, into which gains are cut to fit the crossbars. Iron straps are fastened over these gains, in which holes are made. Holes are also made in the crossbars, and as the markers are moved along the bars, as they may be set wider apart or otherwise, they are held in their places by iron pins inserted in the holes. The crossbars are connected by two flat iron rods, and a tongue is fixed and braced to them. A handle is also fixed behind to guide the motion. At the rear end of each marker wings of wood are attached by

A CORN-MARKER.

which furrows are made. The seed is dropped into these furrows at each intersection of the cross furrows.

FEEDING MEAL TO COWS.—The best way to give meal to cows is either to mix it with some cut hay, moistened so that the meal will adhere to it, or to seald it and give it in the shape of a thin gruel as a drink. In the first place it is necessary to perfect digestion that the saliva should be mixed with the food and that the food should be returned from the first stomach to the mouth for a second chewing or rumina-

tion. This is only done when the food is bulky, requiring considerable chewing. In the second place the gullet, or passage from the mouth to the stomach, in ruminants, opens directly into the third stomach, having intermediate longitudinal openings closed by lips, by which the food enters the first and second stomachs. If the food is bulky and solid it separates the lips of these openings and finds an entrance to either or both the first and second stomachs. If otherwise, it passes over the closed lips and enters the third stomach. In the first case, by a periodic inverted action of the gullet, the food is thrown in small quantities from the stomachs to the mouth, where it is reduced to a soft semi-liquid condition, in which state it is passed easily to the third stomach for digestion. In the second place it misses this process of rumination, and is therefore not in a condition for perfect digestion, and the meal is seen to pass away in the dung in considerable quantities unaltered.

THE TIMBER CULTURE ACT.—A recent amendment of the Act of Congress to encourage the planting of timber upon the western prairies, provides that 160 acres of land, or less, may be entered by any person who is the head of a family or who is 21 years of age. One fourth of the land shall be planted with trees. One fourth of this required quantity must be broken the first year and planted the second year. Another fourth must be broken the second year and planted the third, and the remaining half must be broken the third year and planted the fourth. After eight years' cultivation a deed will be granted. The fees are \$18 for each entry.

How to Kill Skunks.

During all the breeding season, sitting hens, ducks, geese, and turkeys are exceedingly liable to the depredations of skunks. These creatures forage in the night, and will come into sheds, barns, and cellars in quest of food. They are very fond of eggs, and when they have once got a taste of this delicate food they will come so long as there is an egg left. If a dog is set to catch them, the skunk carries too many guns for his enemy, and the result is a perfumed watchman upon the premises for the remainder of the season. If trapped or shot he dies game, and not infrequently leaves a gamey odor in one's clothes that puts them permanently upon the retired list. A correspondent to whom we sent some choice Rouen ducks' eggs last season was robbed by one of these marauders, and we are indebted to him for the following method of destroying skunks, which we give in his own language: "A skunk got at the nest, and sucked all but two of them before we suspected that it was not the hen that broke two eggs every night. She was sitting in a cellar carefully guarded, except the drain, which had an outlet about fifty feet from the building; it was through this the skunk came in. As soon as we suspected the true cause of the mischief we closed the drain, and I sucked out a part of the contents of an egg through a small hole in one end, and put in a little powder of strychnine, shook it up well, and covered the hole with court-plaster, and left it at night near the mouth of the drain, which I had closed up. The next morning the egg was partly eaten, and about two rods distant lay a dead skunk. I think this is the best way, in

MACKEREL-FISHING.—Drawn and Engraved for the American Agriculturist.

careful hands, of 'killing the varmints,' as there is no unpleasant smell which usually accompanies the shooting or trapping them, and it is a dead sure thing."

It would be better indeed if we had suitable poultry houses where sitting birds could be perfectly protected, but as a matter of fact not one farmer in fifty has anything of the kind, and the hens sit where they please. Turkeys almost invariably make their nests in exposed places, and a single skunk upon the premises, if left to himself, will destroy the poultry crop for the season. Use strychnine.

CONNECTICUT.

Mackerel and How they are Caught.

Next to the cod, the mackerel is probably the best known fish, as in a salted state it finds its way to even the most remote inland towns, and is sold fresh in large quantities in all places within easy railroad communication with the coast. The mackerel, *Scomber vernalis*, appears in the markets fresh about the middle of May, and continues nearly to the first of July. When just taken out of the water it is a beautiful fish; the upper part of the body is of a steel blue color, becoming lighter on the sides, while below it is of a silvery white with metallic re-

flections. Extending from the back half way down the sides are 24 to 30 deep blue bands. It is from 16 to 18 inches in length, with a fusiform cylindrical body, its greatest depth being near the last rays of the first dorsal fin. It has an excellent flavor, and furnishes a cheap and savory dish.

Mackerel are very numerous along the Atlantic coast, and are caught by fishing smacks in great numbers from Cape May to Cape Cod. These fish were until late years caught with a small hook, but as fishing became more extensive a new plan was discovered by which a greater number could be caught in less time than with the hook and line. It would take the fishermen, with hook and line, a long time to get a load to bring to market fresh, but now they often get enough in one haul to load their vessel, and there has of late years been an increased quantity brought to Fulton market, which is the great fish depot of New York. When there are a great many fish in market the fishermen salt their mackerel at sea, and avoid a dull sale. The price varies from one to three cents, and is sometimes as low as half a cent per pound. They are, when plenty, peddled through the city by street vendors, and a large number is sold in this way.

The engraving shows the method of catching

the fish with a net. The smackmen have two fishing-boats and a large seine-like net, about 200 fathoms in length and eight in depth, with a large weight of 150 pounds called "Old Tom," fastened to the bottom rope about midway of the net. They have pulleys connected with this weight and small rings fastened to the bottom rope about four feet apart. A long rope is passed through these rings and attached to the pulleys, so by pulling on this rope the men are able to draw up the bottom of the net like a bag. On approaching a school of mackerel the fishermen drop "Old Tom" overboard, and then row around the fish and let out the net so as to form a circle, as seen in the engraving. After the fish have been closely gathered in the net the captain comes alongside the net with the smack, and with a large scoop-net he, with the assistance of the crew, hoists them on board. The engraving also shows how mackerel were formerly caught with the "gig," a method of fishing that afforded much sport to the smack-men. The fish, however, were not always in the humor to bite at the "gig," and the fishermen would often see hundreds of them at the surface of the water at a time and not be able to catch them. The two men standing in the rigging are on the lookout for mackerel.—D. W. MORRIS.

Succulents as Decorative Plants.

BY CHARLES H. HOVEY, CAMBRIDGEPORT, MASS.

The class of plants known as succulents is now attracting much attention amongst gardeners and amateurs on account of their decorative qualities for both the greenhouse and the garden. Their various and often grotesque forms and interesting habit of growth give them a peculiar interest, and afford a never-ending source of study and amusement. Many of them are desirable additions to any collection of plants; some being fine bloomers, lasting in flower from two to three months, while others are indispensable for bedding purposes. Their great tenacity of life, or, in other words, the impunity with which they bear neglect, as also their rapidity of growth when cared for, render them universal favorites.

Of all the plants grouped under the title of succulents the Echeverias will undoubtedly prove the most generally useful. They afford so great a variety in style of growth, and such decided contrasts in color, that in time we shall have our groups of Echeverias, producing a more unique and as striking an effect as we now have from our masses of Geraniums, Coleus, and similar bedding plants. It may be remarked that some botanists include these plants in the genus *Cotyledon*, but as this is still a disputed point it is best in the present article to use the names by which they are known in the collections of florists and in their catalogues. The following species and varieties are some of the most desirable for the greenhouse and garden:

Echeveria agavoides.—One of the rarest and best of the Echeverias; a dwarf, compact grower, with leaves of a semi-transparent green color, tipped with red, exactly resembling in its appearance a miniature Agave.

E. argentea vera.—A new variety from California; leaves six or seven inches long and from one to two in width; the whole plant is completely covered with a thick white powder; this variety most generally grows in clumps, and is very showy.

E. Californica.—Also rather new, from the Pacific coast; with long, narrow, green leaves;

ECHEVERIA METALLICA.

somewhat resembling in style of growth *E. agavoides*; a dwarf, dense grower, and very distinct.

E. farinosa.—Another recent introduction from California; leaves long, narrow, sharply

pointed, and of a beautiful white color; similar to *E. argentea vera*, and one of the best.

E. lurida.—This variety is probably a hybrid from *E. sanguinea*, which it resembles in

ECHEVERIA RETUSA FLORIBUNDA SPLENDENS.

growth; the young leaves are of a bluish red, fading to a rusty brown; a promising species.

E. metallica.—This is the most generally grown of all the Echeverias, and is perhaps the most effective for greenhouse and garden, its large, pink, metallic leaves showing off to great advantage; and its being a very free grower will render it the most popular of all the Echeverias. The engraving shows the appearance of a small specimen.

E. metallica glauca.—Somewhat similar to the preceding, but more compact and regular; leaves large and of a bluish white color; fine for bedding, and a good flowering variety.

E. Mexicana.—A new variety, after the style of *E. secunda glauca*, but much superior; of regular and compact growth, with leaves of a beautiful pale blue color, it forms a perfect rosette, and must supersede all others of its style for edging purposes; synonymous with *E. rosularis*.

E. pumila.—In growth similar to *E. secunda*; leaves long, narrow, and of a glaucous, green color; a distinct variety.

E. racemosa.—A variety said to be a hybrid from *E. sanguinea*, which it resembles in growth; leaves of a pinkish, salmon color.

E. rosea.—Resembling the Cotyledons more than the Echeverias in growth; leaves green, slightly tinged or edged with red.

E. retusa glauca.—A strong growing variety, with glaucous, green leaves; one of the best flowering varieties.

E. retusa floribunda splendens.—The best of all the Echeverias for flowering; flowers a brilliant scarlet, and a very free bloomer; similar in growth to *E. retusa glauca*, but with narrower leaves. See engraving.

E. sanguinea.—A distinct species, with long, narrow leaves, slightly channeled, and of a dark red color; fine for bedding in contrast with the light-colored varieties.

E. scaphophylla.—One of the newest of the Echeverias, a hybrid between *E. agavoides* and *E. linguæfolia*; leaves blunt, and slightly channeled like the latter, but in growth and color similar to *E. agavoides*.

E. secunda.—An old variety with green leaves; a dwarf and compact grower, and fine for bedding.

E. secunda glauca.—One of the best for bedding; similar to *E. secunda* in growth, with leaves of a bluish white color; next to *E. metallica*, perhaps the most generally grown. A small specimen is shown in the engraving.

E. secunda glauca major.—New and fine; a large variety of *E. secunda glauca*, with leaves not quite so light colored.

E. secunda ramosa.—A monstrosity in habit of growth; stem flat, broad, and covered at the top with numerous small green leaves; in appearance resembling the flower of a Cockscomb.

E. nuda, *E. linguæfolia*, *E. lutea gigantea*—are all very similar to *E. retusa glauca*, and are all good flowering varieties.

Of the above varieties, the six most distinct in style of growth and contrast of color are *E. metallica*, *E. Mexicana*, *E. farinosa*, *E. agavoides*, *E. sanguinea*, and *E. metallica glauca*. All the species and varieties above described may be propagated from

seeds or cuttings, and most of them from single leaves; if raised from seed it should be sown and treated similarly to Cineraria or Calceolaria seed. If propagated from cuttings or leaves they should be laid away on a dry shelf until they become thoroughly dry or callous, and then be potted in a light, sandy mixture and

ECHEVERIA SECUNDA GLAUCA.

sparingly watered until rooted. As soon as rooted, if they are repotted in a mixture of leaf-mold or well-rotted manure and loam, with one fifth part sand, they will amply repay the trouble of repotting.

[Last winter we received from Messrs. Olm Brothers, of Newark, N. J., a fine specimen

with the formidable name already given above, "*Echeveria retusa floribunda splendens*." It was so handsome a plant that we had an engraving made from it, which is here given; after the drawing was made the plant kept in flower in our greenhouse for some months.—Ed.]

Improved Mignonette.

Within a few years there has been considerable attention given to the improvement of the Mignonette, and though some of the new varieties that have been sent out have not proved equal to the representations made in their favor, yet we have several that are a decided improvement upon the common form of this old-fashioned garden favorite. A few days ago we received from Mr. James Fleming, seedsman, 67 Nassau street, New York, some spikes of Mignonette that in size were simply astonishing, and having expressed a desire to know more of its history, we are favored with the following account by the raiser, Mr. Samuel Henshaw, gardener to J. C. Green, Esq., New Brighton, Staten Island. Mr. H. says:

"The Mignonette of which I send you a sample is the result of careful selection in saving the seed, thinning, etc., until it is now quite a distinct variety. Three years ago I grew for the first time the variety called *Reseda ameliorata*, which produced flower-spikes about three inches in length; thinking it might be still further improved, I saved seeds of the largest flower-spike, and only the seeds that formed on its lower half. The year following there was a decided improvement, the plants being more vigorous and the flowers much finer. I continued selecting only the finest for seed, and this year the spikes saved for seed for next winter's flowers measure at this date (April 29th) 16½ inches in length, and are still growing. The seeds were sown last fall about the third week in August, in the bed of a small span-roofed house devoted to violets, and treated the same as the violets as to watering, ventilation, etc., air being given freely all winter, and the temperature never allowed to rise to more than 50° at night, and oftener it was about 40°. When the weather was severe the soil was kept rather dry, with occasional doses of weak liquid manure; the plants were thinned to about 12 inches apart, but would have been better if allowed twice this room, as they are now very crowded. The Mignonette for early winter blooming is sown about the end of July in boxes about two feet long by one foot wide and nine inches deep. About six plants are enough to each box. These are placed on the greenhouse shelves in October, and yield abundance of flowers until past midwinter."

This is a useful bit of information, not only to gardeners, but to all who raise flowers or, in fact, any plants from seeds. But few who have not tried it are aware of the decided improvement that may be effected by a proper selection of the flowers for seed. It is too frequently the case that those who intend to save seed wait until the plants have expended their strength in blooming before they gather it, or wait until near the end of the tomato and melon season before they think of next year's crop. It is something to forego the plucking of the earliest and finest flowers or the best and soonest ripened of the garden products. But whoever works in a garden, be it large or small, must have faith, and one exercise of this faith can be manifested in foregoing present enjoyment for the sake of future good.

Evergreens from Seed.

In an article given last March it was stated that the difficulties were so great that we could not advise farmers in general to undertake to raise evergreens from seed. Still the inquiries continue to come, and we will give such directions as can be given, remarking that this is a branch of horticulture requiring the greatest skill and experience, and those who undertake it must expect to meet with disappointment and losses, for these fall to the share of those who have made evergreen growing the business of their lives. One reason why we advise farmers to purchase young evergreens rather than to undertake to raise them is the fact that so few of them like at any time to do what is called "puttering" work, and unless they are willing to give to the evergreens while they are young all the care that they demand, it will be money and time thrown away. But few plants are so "miffy" as these the first year, and our hardiest evergreens when young are as delicate as a tender exotic; and as seedlings two or three years old—an age when they are no longer liable to the troubles of their infancy—can be had at very low rates of those who raise them on a large scale, we are sure that we do farmers a service when we advise them to buy rather than to attempt to grow them. Besides getting serviceable trees two or three years sooner, the time that would be required to raise these seedlings is worth more than the plants will cost. To those disposed to try raising their own trees, we would say that it is now too late to start with any hope of success. The one thing most injurious to the young seedlings is the hot sun; hence the seed must be sown at the very earliest moment. Some growers even sow when only the surface of the earth is thawed, and it is still frozen beneath. To guard against the injurious effects of the sun, the bed must be shaded, and in such a manner as not to prevent a free circulation of air. A very good plan for those who grow upon a small scale is to raise a common hot-bed frame upon bricks or blocks a few inches above the bed, and whitewash the glass. This gives shade and a free circulation of air. On a large scale the beds of convenient width have stakes driven along their edges to which boards six inches wide are nailed, their lower edges being three or four inches above the surface of the bed; upon these boards rest screens made of common lath with the laths an inch and a half apart. The beds of Messrs. R. Douglas & Son, Waukegan, Ill., who are the largest growers in the country, are protected by screens of brush supported upon posts seven feet above the beds, and they have acres covered by this kind of protection; this has the advantage over the other shading that it allows the necessary work to be done without the trouble of removing the screen. The seeds are usually sown broadcast and raked in, the surface being afterwards lightly rolled or pressed. Weeding and thinning have to be done, and a constant watch kept against "damping off." Thousands of seedlings will sometimes decay at the surface of the earth, without any warning; the only remedy for this is to sift on a covering of dry sand kept for the purpose.

Stocks for Fruit-Trees—Peaches.

In discussions with fruit-growers as to the want of success with this or that variety of apple, pear, or other fruit, we have suggested

that an uncongenial stock might have something to do with it, but these gentlemen have not been disposed to adopt this view. In their eyes, one stock is as good as another. Suppose a nurseryman buys a lot of imported or home-raised apple or pear seed; it would be quite within bounds to say that each pound of this contained seeds from a dozen trees of quite different character, not only in the quality of the fruit and its time of ripening, but in the habit of the trees. Some may be regular and others straggling growers, there may be seeds from slow and quick growers, and from those which ripen their fruit in August and those that mature in December. The nurseryman sows his seeds, and when the stocks raised from them are of proper size he buds or grafts them indiscriminately, throwing out, probably, the very unpromising looking ones. To say that a dozen Baldwin apple-trees grafted upon a dozen stocks of widely differing character will, when set in the orchard, all produce fruit precisely alike, is to state something that we can not agree to. In rapidly maturing trees like the peach this matter is more readily tested than with a slow tree like the apple. Entertaining these views, we were much pleased with an article by Col. Edward Wilkins, which appeared in the *American Farmer* (Baltimore) for April. Col. Wilkins is the largest peach-grower in America, and consequently in the world. Having had the pleasure of visiting his immense orchards at Riverside, Md., a few years ago, we know he brings to fruit-growing all the intelligence and shrewdness that a successful merchant applies to his business; he makes peach-growing a business, and a successful one, and has a sharp eye to everything that detracts from or conduces to that success. Having found that varieties of the peach which should ripen some weeks apart would, much to the detriment of the grower, mature very nearly at the same time, as well as other unfavorable indications in his orchards, he has given much thought to the causes of these abnormal peculiarities. In the well considered article to which we have referred he attributes these troubles to uncongenial stocks.

To avoid the yellows the nurserymen try to procure for their stock seed from what is called the "native peach," that is a peach which has long been grown in eastern Virginia from the seed; a very poor fruit, but the tree is remarkably healthy. Col. Wilkins states that there are as many bushels of seed sold as coming from this native peach as there are bushels of the fruit raised. He claims that stocks raised from this seed, from a very poor fruit, grown on a very light soil, are not suitable subjects on which to bud the rich melting varieties which need good soil and culture to bring them to perfection. Col. Wilkins can not see (nor can we) why seeds from healthy budded varieties of the peach should not give more congenial stocks than these miserable "native" peaches. This is not merely a notion with Col. Wilkins, but he gives a bit of experience to support his views. The first orchard he ever had was budded upon stocks raised from the seeds of first-class peaches; this was the best orchard he ever had for size, and health of the trees, and the quality of the fruit. In Europe, where there are no "native" Virginia peaches, we hear of no difficulty resulting from the use of the seeds of good fruit for stock whenever the peach stock is used. In Europe, the peach is generally budded upon some varieties of the plum, which are readily multiplied by layers.

The point of Col. Wilkins's article is that to get peaches true to their kind they should be budded on stocks obtained from healthy trees of the same variety. To restrict the budding to the same variety seems to us an unnecessary refinement, but we would bud clingstones on clingstone and freestones on free stocks, and late sorts we would not bud upon stocks from early varieties, nor vice versa. To the amateur cultivator this matter presents but little importance. He sets trees, and is only too glad if he gets any fruit at all; but to the peach-grower who numbers his trees of each variety by the thousand, the ripening of a sort only three days out of its proper season is a great inconvenience and loss. Another point this gentleman insists upon is that the buds for inserting upon the stocks should be from select bearing trees. It is the custom in nurseries to take buds from trees that were budded the year before, and the growth of these buds will be taken to furnish buds the next year; and so on, always budding from young stock that has never fruited. We are not prepared to give an opinion upon this point, but it is a legitimate subject of inquiry if constantly budding year after year, from trees that have produced wood and leaves only, may not ultimately have an effect upon the bearing qualities of the trees. We regret that we are unable to give Colonel Wilkins's article entire, but we believe we have presented the main points of it. It is a good sign for our horticultural progress that one so largely engaged in fruit-culture gives his personal experience for the benefit of others.

A Trap for Cut-Worms.

There is no trustworthy remedy against cut-worms except actual catching and killing them. Any application to the soil sufficiently strong to injure or discommode them would certainly destroy the crop, and all the recommendations to use salt, carbolic acid, and other similar substances may be set aside as useless in practice. We have trapped them in various ways, beneath chips, stones, and in holes punched in the ground with a smooth round stick, such as an old broom handle. But unfortunately in these cases they are caught only after they have spent the night in destroying the young cabbages or corn. Finally we hit upon the expedient of surrounding the hill or plant with a ring of holes close together, and in this way caught a great many of the pests every night. Making so many holes with a single stick is a slow process, but with the contrivance shown in the annexed engraving, the whole ring of holes is made at one stroke. An old shovel handle is split for about a foot with a fine saw. The split portion is soaked in boiling water to soften it and the ends are inserted into holes made in a hoop or ring of wood two inches wide, one inch thick, and eight inches in diameter. In the bottom of the ring there are inserted a number of pieces of an old broom-handle projecting two inches and placed not more than a quarter of an inch apart. When this is pressed into the earth around a hill of corn or a cabbage plant, it leaves a circle of smooth round holes two inches deep with compact sides and bottoms. The cut-worms fall into these holes in their nightly rambles and may be found and destroyed in the morning.

My Garden Mistakes and Successes in 1873.

BY COL. G. S. INNIS, COLUMBUS, O.

[The following article was intended for April, but failed to reach us in time. It was crowded out last month, and though it is late for some of its suggestions, we give it, as the experience of so skilled a cultivator as Colonel Innis, if put on record, is sure to be of use to some one.—ED.]

TOMATOES.—We had a very fine lot of plants, short, stalky, and branching. We made the mistake, however, of putting them on some very rich land—land that would have produced a fine crop of onions or cabbages, but was too highly manured for tomatoes. This I had learned by experience a time or two before, but somehow we have to learn such things over again every five or ten years. We will not repeat this folly the coming season, but will select good corn or wheat land, rather inclined to clay than sand or loam, for our tomato crop. This moderately rich soil will produce more fruit and less vine, will ripen the fruit more evenly and earlier, and the product will be smooth and of the very best flavor.

CABBAGES.—With our early cabbages we made a success last year. This was done by sowing the seed quite early in a hot-bed; then transplanting into other beds early in March, putting the plants about four inches apart each way. This made us large, fine, and well-rooted plants by the middle of April, when we removed them to the field and then set them 30 inches apart each way in very highly manured land, and had very large solid heads, and early too. Before other folks got in our way we had sold most of them at good prices. We never made much by planting inferior plants of any kind, or by using poor seed, to save the price or labor of obtaining good ones.

MELONS.—With Skillman's fine netted green-fleshed melon we made a fine success. We planted them on the richest land we had. A sandy loam, subsoil of yellow clay, underlaid with sand and gravel. Planted about May 10th, or as soon as the ground gets warm enough for corn or beans, in rows seven feet apart both ways. The greatest enemy of all improved varieties of vines is the yellow striped bug. For this mix three table-spoonfuls of good Paris green in a three-gallon can of water and sprinkle the plant. This is certain death to all insect life. By the way, permit me to say right here that last fall a green-looking worm ate up most of the late cabbage in Central Ohio. It was a rare thing that a patch escaped. Visiting a friend, I noticed they had the finest kind of cabbage heads. Upon being asked how it came that they had such nice cabbages, while other folk's were all destroyed by the worms, the lady replied that she noticed the worms were eating theirs, and took common table salt and sprinkled them quite freely; that it seemed to rust or burn the plants a little at first, but the worms quit at once, the cabbages soon recovered, and made the best crop they had had for ten years. I determined to learn a little from this good housewife. All garden vegetables want to be worked while young, and must be kept entirely clean of weeds or other vegetable growth to insure success. Two crops can not be produced on the same ground at the same time. A crop of weeds and useful plants can not be raised together under any circumstances.

POTATOES.—With the Early Rose, planted very early, we made a success, notwithstanding the Colorado bugs. This variety seems to do best on light, rich soils, heavy wet clays being unsuited to it. The Early Rose, in common with all the early varieties, should be planted as soon in spring as the ground can be worked or made in good order. When this is done they make a crop before the extreme hot and dry weather sets in, about July or August.

Peerless.—This variety yields enormously, and our greatest mistake of last year was in not planting more of them. In 1872 the Peerless were nearly worthless for table use, but last year they were quite good. The reason of this difference seems to me is that the Peerless being a medium early variety, and planted early, ripened in 1872 in a very dry and very hot spell of weather, the latter part of July and first of August, the thermometer ranging in the nineties most of the time day and night. This made the potato deficient in starch, and consequently not good. In 1873 the weather was rainy and very much cooler when they were ripening, and made them of good quality. Were it not for the bugs, I would suggest planting late, say about June 20th, so they would ripen during the cool weather in September.

Thorburn's Late Rose.—This, with us, was a grand success, though I doubt it being a distinct variety, probably a selection from the Early Rose. Potatoes can be changed very considerably by judicious selections.

Campbell's Late Rose.—This variety with us was not a success. It grew vigorously for a time, and promised well, but mildewed badly in two or three days' time, and made a poor crop on very good land.

The Jersey Peachblow was generally a failure in Central Ohio the past season.

Can One be Both Market Gardener and Florist?

BY PETER HENDERSON.

A correspondent from Columbus, Ohio, asks me if the prosecution of the business of market gardening can be profitably combined with that of the florist, and as there are doubtless many readers situated in places where the products of both are wanted I will occupy a short space in reply. On this subject I feel competent to advise, having for many years been extensively engaged in both pursuits at the same time, and have made them both fairly profitable, more so, I believe, than if the two had been separate. This was particularly so in the beginning. Beginning with some ten acres of market garden and three small greenhouses, I employed an average of eight men throughout the year. From April to December our labor was almost exclusively in the market garden, or what little was necessary for the flowers planted outside, these then being of but secondary importance. Our main energies were devoted to the market garden. On the approach of winter, instead of discharging a portion of our hands, as our neighbors who were market gardeners only did, the work then necessary in our greenhouses profitably employed the help no longer required in the vegetable department, thus enabling us to retain a full corps of trained men ready for the busy work in spring, instead of having the annoyance of breaking in unknown and inexpe-

rienced hands each year, the loss from which is rarely sufficiently estimated.

A difficulty with the florist at the beginning is, that the business is usually too small to afford the expense of a horse and wagou, which at some seasons is indispensable; but when he combines his business with that of market gardening the teams necessary for that can be used for the occasional requirements of the greenhouse with little or no detriment. In many other respects one business can be made to serve the other. Under the tables or benches of the greenhouse on which the flowers are grown is a capital place for forcing rhubarb, an article everywhere commanding a ready sale at a high price. It requires but little knowledge or labor to produce this crop under the greenhouse benches. All that is necessary to do is to pack the large crowns or clumps of rhubarb as closely together as they will go, filling in the interstices with any good soil, beginning say the first week in January, February, and March to give a succession of crops. The roots should have been previously dug up and kept in some cool shed or cellar or in the open ground, provided they are so protected from frost that they can be dug up at any time in winter. Asparagus roots may be treated in the same way, but it is necessary that the asparagus and rhubarb roots should be of good size, such as when growing in the open ground would give strong and healthy shoots. Young or small plants of either would not answer. Mushrooms may also be grown under the benches of the greenhouse, the beds being prepared in the usual way; but the crop of these in inexperienced hands would not be likely to be so successful, nor would the sale, unless in very large cities, be so certain. The greenhouse too, as we have before stated in your columns, is quite as safe a place in which to raise all kinds of plants in use in the market garden as either the hot-bed or cold-frame. It can be easily made to serve this purpose if the demand for flowers is not yet enough to require the whole space. Vegetable plants can be raised with greater safety and with less care than is necessary in raising them in hot-beds or in frames, while the work is far more agreeable.

Three Crops in One Year.

S. C. wrote last December from Lexington, S. C., in the most enthusiastic manner respecting the great advantages offered by the climate of his state, and gives the following account of one of his experiments:

The first week in January last, I planted a small plot of ground in my garden with garden peas, which were ready for the table the 1st of May, and cleared away 20th of June, when I manured and turned under the same, planting northern corn in drills. The corn yielded splendidly, was matured, and cut the first week in September, with the beans which I planted in hills between the corn-rows, and also yielded well. On the 5th of Sept., I again covered it with manure and plowed under, when I sowed turnips in the drill. The turnips are still growing finely, and are now ready for the table. I have now sown barley in drills between the

turnip rows, which will be ripe by the middle of next June, when a crop of cow-peas or other variety of beans may be grown, to be followed by turnips again, or a similar crop.

The ground on which this experiment has been made has been in cultivation thirty-five years, and is better to-day than ever before,

THE JAPAN PRIMROSE.—(*Primula Japonica*.)

and I think there is little danger of over-cropping if a sufficiency of plant food is furnished to meet the wants of each successive crop. This is but a single experiment, but it may be successfully repeated every year, for this has not been the most favorable season for farming, and I cordially invite my northern friends to come and see for themselves. But few persons, even among those who have cultivated all their lives, have any idea what a good soil properly managed is capable of producing.

Primula Japonica—"Queen of Primroses."

The Japan Primrose we are obliged to regard as one of the greatest of recent horticultural humbugs—or rather let us say, not the plant, but the manner in which it was introduced. The plant taken upon its own merits is well enough, and a desirable addition to our hardy species, should it prove hardy, as we do not doubt it will. It is only when we compare the plant as it really is with the representations made of it both in descriptions and engravings in foreign journals and catalogues, that we are obliged to regard it as a fraud. An English journal goes on in this way: "Hail! Queen of the Primroses! for so its introducer designates the lovely flower we now figure, which is as

hardy as a peasant and as resplendent as a princess," which as a "gush" is about equal to anything to be found under "agriculture" in a New York weekly paper. Then we have in another journal with a picture to match, "A *Primula* a foot and a half high, bearing four or five separate whorls of flowers, each an inch in diameter, and of a splendid magenta color, and the plant moreover perfectly hardy—can anything be added to this to indicate its value?" To this last conundrum we can say yes—tell the truth about it, and say that while there are four or five whorls of flowers, they do not all open at the same time, and that the plant is about one fourth as floriferous as the pictures show, and as this description would imply. Our florists, with this as they do with other new things, have copied the foreign descriptions and engravings, and are not to be charged with misrepresenting a plant they had not yet had an opportunity of flowering. Last year English cultivators were bringing it into flower, and complaints began to appear in their horticultural journals that the plant was not like the pictures, and though the question was often asked if it had ever been known to produce more than one whorl of flowers at a time, we do not recollect to have seen an affirmative answer. We have inquired among those of our friends who flowered the Primrose last year, and their experience with our own this spring, with plants direct from Japan and from one of the best floral establishments in the country, make us conclude that if two or more whorls of flowers ever do open at once it is an unusual occurrence, and not the general habit of the plant. In our own plants by the time the first (lowest) whorl has faded, the flowers upon that next above are just beginning to open, and the seed vessels begin to enlarge so rapidly that if one did not wish seeds it would be best to remove them, as they detract from the beauty of the flowers on

the whorl above. The engraving gives a representation of our best plant, which to insure exactness and leave nothing to the imagination of the artist, was drawn with a camera lucida, which gives even more accuracy than a photograph. We do not know that any one has yet tried the Japan Primrose as an open border plant, but it is quite hardy in England, and as it has been kept until midwinter in a cold frame, we do not doubt that it will prove completely hardy. To sum up, this plant has been much over-praised, and been put upon the market at a high price with descriptions which to say the least were highly colored, it would be hardly polite to add with respect to distinguished horticulturists, "the same with intent to deceive," for we can understand that a florist if he be a F. H. S., or even writes an L. S. after his name, can look at a plant with double extra glorifying spectacles, especially if said plant is to bring him £1 1s. (the only fashionable price, which is quite different from the vulgar £1) a specimen. It is, however, a pretty plant, and when it finds its place in the border with other spring bloomers it will no doubt be quite popular. It is no more entitled to be called "Queen of Primroses" than *P. Cortusoides* and others, and as for a plant to force there is no need of it while we have our fine varieties of Chinese Primroses.

THE HOUSEHOLD.

(For other Household Items, see "Basket" pages.)

Farm Bath-Houses.

It must be confessed that the virtue of cleanliness is not sufficiently practiced by farmers or their families. Yet there is no class of people with whom the daily bath in summer time is a more

Fig. 1.—BATH-HOUSE.

imperative duty, and scarcely any to whom the duty can be made more easily practicable. Generally, farm houses have few conveniences for bathing indoors, but there is plenty of room out of doors for it. A bath-house will be found probably the most convenient arrangement. Where there is a small stream upon the farm, the plan shown in figures 1 and 2 may be adopted. We have made use of such a contrivance for the convenience of our own workmen, and they and their boys very gladly profited by it. It consists of six light poles or scantlings, pointed at one end, and set in the ground so as to cross the stream. Eight light cross-pieces are made with a wire hook at each end; the little brass hooks sold at the shops will answer the purpose. These hooks fit into small eye-screws inserted into the upright pieces, so that when the frame is put together a screen of double width brown sheeting may be hung around them. One side is made to open like a tent door, but may be closed by means of buttons and button-holes upon the ends of the strip of cloth. The screen incloses a space sufficiently large for a person to bathe in. A plank is placed across the stream upon which one may stand while dressing or undressing, and some hooks are fastened to one of the cross-pieces upon which to hang the clothes. Figure 1 shows

Fig. 4.—CUP VALVE.

the appearance of the screen. Figure 2 shows the inside with the arrangement of the frame. Where there is no stream upon the farm, a bath-house of similar construction might be set up in the backyard, in which a pail or tub of water might take the place of the stream.

A bath-house of somewhat more solid character is shown at figure 3. It is arranged for a shower-bath, and is built of light scantling and boards. A platform is made within upon which the bather

may stand, and from which the water may run into a drain and be carried away. A common tub is placed upon the roof, in the bottom of which the cup valve seen at figure 4, with the sprinkler and pipe, is fitted and cemented so as to be water-tight. The pipe may be of lead, and the valve cup and sprinkler of tin. The valve is a ball of lead, which is attached by a cord to a lever. From the other end of the lever a cord passes into the house within reach of the bather. It is not wise to use cold water from a well for a shower-bath, but only water which has been exposed to the air and sun until it has gained the same temperature as the atmosphere. Nor is it wise to allow a sudden shower to fall upon the head or shoulders and the back of the neck, as is frequently done. But when the water is falling the feet should be extended alternately into the stream, then each knee, then one side, afterwards the other, and by and by the stream may be received upon the shoulders and the back. In the mean time friction of the body should be kept up with a sponge or flesh brush, and the bath should not be long continued. The reaction from a bath thus taken is very pleasant, and after a weary day in the hay

or harvest field it brings a sensation of purity as well as of rest. It prevents that unwholesome, clammy perspiration which is always experienced when the skin is foul, and it produces grateful, restful sleep. Of course, no person who takes this necessary pains to be clean will sleep in his working underclothing; that would be greatly undoing what the bath has done. The working underclothing should hang all night in an airy place, and a proper night-dress should be worn in bed.

Home Topics.

BY FAITH ROCHESTER.

"GOOD LIVING."—There is a difference of opinion as to what constitutes good living, and I shall not undertake to settle any disputes *de gustibus*. The Esquimaux Indian may eat his delicious tallow candle and drink his whale oil, and call both good; the Iclander may delight in his rancid butter; and others may swallow sour-kraut with unmoved face, or cook and eat their wild game after it has become unbearable to the sense of smell—I shall not say that these things are not pleasant to the taste of those who eat them—but "deliver me." Science may put in a modest word—and Science, you observe, grows more and more modest in her *dictums*—concerning the *healthfulness* of various articles of diet. She may venture to ask us whether anything *eau really* be good living which gives only a momentary pleasure to the nerves of taste, while it destroys the comfort of the body and undermines the health.

Nothing can be called "good living" by a person who has not the least relish for it, and it is doubtful whether anything is really good for a person which is eaten with positive disrelish. So I think it very unwise to oblige children to eat anything against which their stomachs rebel, because they have taken it upon their plates or because we think it is good for them. I know the dilemma very well, and am sometimes obliged to decide that it shall be that or nothing farther at that meal, when I perceive that the child refuses its plain fare, which was palatable only a moment before, as soon as it catches sight of something more dainty.

But it is very certain that the appetite changes with habit, and that it is capable of cultivation. Children who are brought up to eat vegetables saturated with butter and highly seasoned with pepper and salt, so that very little, if any, of the natural flavor of the vegetable is retained, can not

believe that they could relish the same things simply well-cooked and only very moderately seasoned. They even prefer rancid butter on their squash or turnip to no butter at all, and then if there is any disagreeable flavor, or combination of flavors, they drown it out with pepper.

It sometimes happens that a person who has learned how much depends upon care in the preparation of articles of food will sit down to a table where there is a variety of dishes which he would like if suitably cooked, and not find a single thing that he can relish. The potatoes are soggy, or flavored with the decay which one or more bad ones had imparted to the kettleful, or they are served swimming in hog's fat or melted butter. The other vegetables are all tainted with poor butter, or made hot with pepper or over-salted. The eggs are cooked so much as to be very hard of

Fig. 2.—INTERIOR OF BATH-HOUSE.

digestion. The meat is not "just done," or is too greasy. The prepared fruit has been deprived of its own finest flavor, and the fault has not been remedied by the excess of sugar in its seasoning. The yeast bread is sour and hard, and the hot biscuit is green with soda. Even the graham gem gives out an odor of soda as you break it open, and the oatmeal mush is so salt that you can not like it. Even the milk tastes of the cellar. But there is cake and there is pie, and you are supposed to be able to fall back upon these with satisfaction; but it is not at all likely that a housekeeper who spoils all her plain cookery by carelessness or ignorance will give you very satisfactory and wholesome pie or cake. Anyhow, a well-educated stomach does not wish to depend upon pie and cake—it wants good nutritious and appetizing food.

A MAN'S REPORT OF A GOOD COOK.—A gentleman who had just returned from a business trip to Missouri said in my hearing that Mrs. — was the "best cook in Missouri." I took an early opportunity to ask him to tell me wherein the excellence of her cooking lay.

"Well, in the first place," said he, laughing, "her table-cloth is always nice and clean. Then her dishes are always so bright, and everything she puts on the table comes on in good shape, somehow."

Fig. 3.—SHOWER-BATH.

"Go on," I said, "All this gives you a good appetite for the food itself."

"Yes," he replied. "I always feel as though the victuals would be good as soon as I see her table, and they are good. She gives us just the same things that we get at other places, and they seem to be cooked plainly and not much seasoned, but they are always cooked *just right*—nothing burned and nothing half raw. And they all *look so nice!*"

"You see, Faith," good-naturedly interposed this gentleman's wife, to whose skirts two small children were at that moment clinging—"You see,

Mrs. S. has not a single child to soil her table-cloth or hinder her washing it, or to demand immediate attention at any critical moment during her cooking. She does all of her work herself, and does it nicely—not much as most hired girls would do it."

Yes, I *did* see, and so did the gentleman who gave me his idea of a good cook; and we all agreed that he was probably right in his estimate of the Missouri housekeeper, while we realized that these little things, which are so important after all, are not so easy for every housekeeper to secure as many might suppose at first thought. Yet these things, carefulness in details, cleanliness, and order, are always worth striving for.

NIGHT VISITS.—Mother, you had better say "no" decidedly when your little girl asks if she may go to stay all night with Mollie or Katie, or Bell; and never consent to your little boy's request to be allowed to spend the night with one of his school-mates. Tell them that the night was made for sleep, and not for long talks while lying in bed. Explain to them what a blessed thing sleep is, "tired Nature's sweet restorer," and what a good thing it is to get a habit of going to bed and to sleep regularly at an early hour, so that body and brain may both get plenty of quiet rest, so necessary for their growth and healthful activity. Then give them clean, well-aired beds, in rooms where there is plenty of pure air all night long, and let them sleep until they wake themselves in the morning.

EARLY RISING.—The old couplet—

"Early to bed and early to rise
Makes a man healthy, wealthy, and wise—"

seems to be falling into contempt. The cause of this may be the fact that too many have insisted only upon early rising without paying any attention to the hour of retiring. It has been discovered that most of us who work with our hands or our brains take too little sleep, and so grow nervous and diseased. So late rising is recommended, while little protest is made against the late hours of bedtime in which such persons usually indulge. This is beginning a reform at the wrong end.

It is better to begin at this end, though, than not to begin at all upon a reform. Lack of sleep is one of our most crying physical sins. We know how cross and unreasonable small children become when they lose their regular daily nap. Children of a larger growth are affected in the same way, though they, perhaps, only "fret inwardly." The scolding and fault-finding in families would grow beautifully less if all the family members had plenty of healthful rest for body and brain, such as natural sleep affords. The demand for stimulants of all kinds would also grow less.

It is a very cruel thing to wake a child from its morning sleep. If it sleeps late, it is probably because it goes to bed late—unless it sleeps from very stupor, because its bedroom is so badly ventilated. If the child comes late to breakfast, or otherwise causes annoyance, let it feel some natural inconvenience or discomfort itself—a cold breakfast perhaps, or the loss of papa's morning society before business claims him for the day. It will soon learn that "early to bed" is the natural forerunner of "early to rise."

It is only fair that the older members of the family should grow quiet as the children's bedtime approaches, so that the little ones will not feel that they are making a great sacrifice in leaving the family circle.

I do not know whether all children need the same amount of sleep. Certainly the youngest ones require most. Our boy of seven thrives best upon ten hours sleep out of each twenty-four; and I see that other children of that age require the same amount. The younger children take more when they take what they seem to need, but all are in the habit of sitting down with the family to a quarter-past-six breakfast, as a general rule.

HANGING LAMPS.—"Somebody keeps getting in my light." "Take care! you'll have that lamp tipped over!" Such expressions are very common where the "evening lamp" stands upon a table

around which the family gather for reading and amusement.

I have lately been visiting in a family where no such expressions are heard, where all, sitting in any part of the room, enjoy a full flood of light. This family could not be induced to part with their hanging lamp. It gives them a feeling of safety in the midst of fun and frolic, and it is always an ornament to the room. Some rooms are too low for hanging lamps, but wall lamps might often be used to advantage in such rooms. The room of which I write is twelve feet high, but the same lamp could be used in a lower room without inconvenience by using a shorter chain for its suspension. It has three lamps, but seldom are they all lighted at once. The frame-work is of bronze, and the glass oil fountains are taken down upon the table for trimming and filling. This lamp cost ten dollars, but cheaper ones can be obtained—those with two burners or with only one, of various patterns.

THE BROKEN LAMP.—If the fountain (or the glass globe that holds the oil) has only come loose from the standard, this is very easily remedied by the use of plaster of Paris. Mix a small quantity with water, make it as thick as cream, and fill it in between the glass of the fountain and the hollow in the top of the standard as quickly as possible. As it sets immediately, everything must be done with promptness. If the fountain is broken in pieces, and there is a whole bronze or brass standard remaining, it will pay to purchase a new fountain and set it upon the old standard in the manner described above. The brass top can be fastened on in the same way.

CLEANING NEW IRON-WARE.—I do not remember to have seen directions anywhere for preparing new cast-iron utensils for service in cooking. I know I had a deal of trouble with my first stove furniture, and whenever I have anything of the kind to deal with now I wonder if there is not some better way than I have learned. I have just been tackling a new set of iron gem-pans. I filled them with ashes and water and left them standing during the forenoon. I heated them on the stove before emptying them, and then gave them a good washing and rinsing. I think they will do for use to-morrow morning. I usually scour new kettles with ashes, then rub them over with a little grease, and wash them well with suds. To-day a lady told me that it was a good way to wash new irons with sour milk. I had no sour milk to use, but I do not see the philosophy of it. It is not rust with which we have to deal in cleaning new iron, but a fine sand, used in the casting.

SALT MACKEREL is almost always too salt when served at table. So I think that Prof. Blot is right in advising a twenty-four-hours soaking, the water to be changed three times. Then he would have you broil the fish over hot coals. It may be served with a little cream, or dry if preferred.

A lady cooks mackerel for dinner in the following acceptable manner: Wash it thoroughly and soak it over-night. In the morning change it to fresh water, and two hours before dinner put it in enough sweet skimmed milk to cover it. Then put it in cold water to cook, never letting it more than simmer in the gentlest manner, but keeping it in water at the boiling point for about twenty minutes. Take it carefully from the boiling water upon an unrusty baking tin, cover with sweet cream, and set in the oven for a few minutes before serving. But the next biscuit you bake in that tin may taste of mackerel unless you are very careful in washing it.

CRACKER DESSERT.—I do not remember to have seen in print directions for making a quick and cheap and pretty and palatable dessert which I learned how to make many years ago. Choose whole soda crackers, and lay each one upon a separate small plate. Pour upon it enough boiling water to soak it well, and leave none upon the plate; cover with a dressing of good sweetened cream with a spoonful of jelly in the center if you choose, or dip upon it a portion of nice fruit, canned, stewed, or fresh, as is convenient.

RECIPE FOR INK.—I thought I would not write another word with this detestable "writing fluid," but wait until I had made myself a whole gallon of good black ink. But it occurs to me that some one else may also be suffering for good black ink, and I might tell them how to get a gallon of it for a dime. I have made it several times, and always with success, and the materials have never cost over ten cents. The actual cost is probably less, but your druggist may not be willing to put up any "prescription" for even so small a sum. Ask him for 1 oz. extract of logwood, 48 grains bichromate of potash, 24 grains prussiate of potash. Heat a gallon of soft water to boiling, add the logwood and boil five minutes, then add the other materials and boil all together two minutes.

Wet Boots.—A friend writes from Europe: What an amount of discomfort wet boots entail, to be sure; and how well we all recall the fretful efforts we have now and then made to draw on a pair of hard-baked ones which were put by the fire over-night to dry. Damp and adhesive within, they are without stiff and unyielding as horn. Once on, they are a sort of modern stocks, destructive of all comfort, and entirely demoralizing to the temper. The following simple device will rob the cold, wet barn-yard of a slushy winter or spring evening of half its promise of discomfort for the next morning: When the boots are taken off, fill them quite full with dry oats. This grain has a great fondness for damp, and will rapidly absorb the last vestige of it from the wet leather. As it takes up the moisture it swells and fills the boot with a tightly fitting last, keeping its form good, and drying the leather without hardening it. In the morning, shake out the oats and hang them in a bag near the fire to dry, ready for the next wet night, draw on the boots, and go happily about the day's work. This simple recipe, tender-footed reader, will save you much discomfort, and will make you a tender-hearted reader as you sit in your soft foot gear looking over your *Agriculturist* as you wait for breakfast to be made ready.

Wants to Suit George.—A lady asks for help. Who will respond? She says: "I should like to ask the best way to make a nice, light, boiled, cheap pudding—one that we can afford to eat as often as we want it. I have tried a number, but have failed to suit George. Will some of the lady readers please help me out? Also I should be pleased to get a recipe for nice sponge cake, and one for catsup that will keep for a year."

Washing Milk Dishes.—Last fall there was an item on washing milk dishes. One of our housekeepers thinks her way is better. She says: "First wash the pans in lukewarm water which, without causing the cheesy element in the milk to adhere, does entirely dissolve the cream. Follow with clear, hot water; then scald the pans and wipe them, after which give them a 'sun bath,' or in the cool season place by the hot stove until sure there is no moisture about the seams. I use no soap, but my pans are always sweet and smooth."

Tea Cakes.—By Mississippi.—Five tea-cups of flour, two and a half of sugar, half a cup of butter, four eggs, sour cream enough to make a soft dough, and one tea-spoonful of soda. Roll thin, cut into shapes, and bake in a tolerably quick stove.

Baked Apple Dumplings.—By Mississippi.—Roll out some dough thicker than pie-crust, and inclose a handful of sliced ripe apples well covered with sugar and butter. Bring the edges together as in any other dumplings. When as many are made as are desired, place them side by side in a pudding pan, spread butter and sugar over them, and pour boiling water to about half cover the dumplings. Put them in the stove and cook moderately fast until they are nicely browned. The butter, sugar, and water make a nice sauce, which can be enriched with more butter, and flavored with nutmeg if desired.

BOYS & GIRLS' COLUMNS.

A Street Toy—The Magic Tape.

One who goes about the streets of New York, whether he is only a visitor or lives in the city, is much amused at the variety of toys offered for sale by the street vendors. Some have a single toy, the whole stock of which they carry in their hands and coat pockets or in a bag; others have several, which they display upon a stand that can be carried from place to place. Very often the fashion will suddenly change, and a particular toy will disappear and another take its place. One of the new toys of this kind is one called the "magic tape." Not long ago there were men and boys crying out, "Here you are, only ten cents—the magic tape—here you are." Of course we always stop to look at these street things, as they are often quite amusing. In this case the man had what appeared to be a small square stick with a slit in two opposite sides, and through this slit there ran a piece of tape with a knot at each end to keep it from running through. There did not seem to be anything very strange in a piece of common red tape hanging from a slit in a square stick—but the man took hold of the knot upon the opposite side and pulled it through, and behold it came out black! Some of these square sticks had a tape at each end, as in figure 1, and each one by being pulled through showed two different colors. What could make the tape change color so quickly by just drawing it through a slit? Being used to such tricks, we saw at once how it was done, and by showing you the inside of the affair in figure 2 you will readily see the way of it. The square stick is made of a piece of pasteboard, cut part way through so that it will bend easily and neatly. The tape, instead of going directly through the

Fig. 1.—OUTSIDE.

Fig. 2.—INSIDE.

slits in the side, as it appears to, is much longer than it looks to be, and is passed around a loop of string or wire fastened inside of the case. If one half of the tape be white and the other half blackened with ink, it will be seen that when one knot is pulled the white will show, and when the other is pulled the red will appear. Like all tricks of this kind, this is easy enough when you know how.

He has a Strong Passion.

One of our boys says in a letter that he has "a strong passion for writing," and sends us an article hoping that we will publish it. Our declining to print the article will, of course, disappoint the writer, but it is better to do that than to publish an article that would only interest him and perhaps his family. We think that some journals for young people have done mischief by printing articles by children and giving the names of the writers. It directs a child's attention from proper studies, and in many cases it encourages a harmful vanity by printing children's names. While we like to have the boys and girls write to us and tell us what they are doing, and ask us questions about things, we rarely print their articles, and almost never, except in awards of prizes, give their names. Now, we would not discourage any boy who wishes to become a writer; indeed, if he is naturally

but in this direction, it would not be possible to discourage him. But boys with a "strong passion" in this way should remember that they may indulge it to the loss of something useful. We pity the youngster who has taken it into his head that he will get his living with the pen. Some of the very few successful writers are held up as examples, but very few know of the thousands of miserable failures made by men who try to write for a livelihood. So we say to this and all other boys with "a strong passion for writing," first learn some useful occupation by which you can always be sure of a living, then if you have a marked talent for writing it will find a chance for exercise. But one can not write without education and experience. And you can no more draw water from an empty cistern than write anything worth reading from a brain that is not well stored with knowledge gained from observation and study. Do not indulge in this strong passion, or any other, until you have a thorough English education at least, and we would especially advise the boy in question to give his attention to spelling and grammar. A passion for writing is not half so desirable as the ability to write well.

A Beautiful Charity.

As we passed out of the depot in Boston, two or three years ago, we saw by a sign that "Flowers for the sick poor may be left at — chapel, on Tuesdays, Thursdays, and Saturdays." We stopped and looked at this sign and thought, "Well, this is a 'Boston notion,' and a blessed one it is." Upon inquiry, we found that certain ladies met at a chapel which was handy to the many business men who have fine places in the vicinity of Boston, and that these gentlemen brought in flowers on certain days, and the ladies made them up into bouquets and distributed them among the sick in the poorer parts of the city, and if there were any left after all the invalids were supplied, they were taken to the women who work all day in crowded factories and shops. We say this is a beautiful charity. You who have never lived, much less been sick, in a house in a narrow street, where the only view is another house upon the other side of the street, can not imagine what a precious gift a handful of even common flowers can be. How many a poor boy and girl have been made happy, and the hours of their sickness made less dreary by having some bright and beautiful flowers to tell them of the world without! and more than this, to tell them that there are kind and loving hearts which could devise and carry out such a blessed plan! A good thing is sure to be imitated, and last summer some ladies in New York did the same kind office for the many sick in the public hospitals. Each one of you boys and girls can be a society of one to do some good in this way. People make a great mistake in sending the sick things to eat. It is done in kindness, but it is in most cases mistaken kindness. The sight is often the only sense that can be gratified without injury, and flowers are almost always welcome to the sick. When you know that one is ill—and you need not care if it is a personal acquaintance or not, only know that some one needs them—you can often do much good by quietly leaving a bunch of flowers at the house. Wild flowers are often quite as pleasing as any. When you know that the person is very ill, avoid all strongly perfumed flowers, as these are sometimes oppressive even to those who like them when they are well. It is not the value of a gift that is appreciated, it is the thoughtfulness that sends a gift at all; and the merest child in this way can often bring light and cheerfulness into the chamber of sickness. Think of this, and when the opportunity offers, act.

Games for Picnics.

Unless there is some lively person at a picnic who knows all sorts of amusing games, and will "keep things agoing," the affair is very apt to prove a dull one. There are a plenty of games for in-doors, but most of these are not suited as out-door amusement. We know that fox and geese and such games, which are too boisterous for the parlor, are just the things for the open air, but these lively games are so few that it is a pity we had not more of them. We heard the other day of a game which boys can play for the amusement of the girls, as it is a little too rough for them to engage in it. In fact, it is a trick rather than a game, and there is not much fun about it if all know it. It is called the "Prussian Drill." The boys are the soldiers, and are drawn up on the grass to be drilled in the presence of the young ladies. The captain takes his place in front and the sergeant is in his place on the right of the company; these two only should know the trick. The captain should be quite pompous, and tell his troops to follow the motions of the sergeant. He begins by a few simple movements, as "heads up," "eyes right," "front," "eyes left," etc. Then the order is given "ground right knees," and all follow the sergeant in kneeling on the

right knee. "Right hands forward," "left hands backward," brings the arms out to front and rear. Then the captain gives the order to "fire," at which the sergeant gives the boy next to him a push, he tumbles against the next, and all, being in this helpless position, go over like a row of bricks, to the great amusement of the spectators. If you know that there is any "touchy" boy in the party, who can not get a harmless tumble upon the grass without being offended, you had better not try this trick; but with boys who like fun, even if it is at their own expense, it is very amusing. Who will tell us some good games for picnics that both boys and girls can take a part in—not the old, old ones, but some that have come up of late years?

About Old Fireplaces.

In these days of stoves there are but few fireplaces compared to what there were fifty or more years ago, and those that we do see are common affairs made to simply burn wood. In olden times, those who built houses took much more pains with fireplaces than we see given to them at present. They were, in the houses of the wealthy, made very showy and expensive. The mantel-piece was often curiously carved and costly, and the opening of the fireplace surrounded by a frame of brass, which, with the large brass andirons, was kept as bright as could be, and as the two reflected the light of the fire it made the fireplace look very bright and cheerful. In houses a hundred years old or more there can still be found some of these quaint fireplaces, which were in their day thought very fine. In the better houses of that time it was a very common custom to have all around the opening of the fireplace a row of ornamental tiles. These were imported from Holland for the purpose, and were known as Dutch tiles. They were, however, used by others besides the Dutch settlers, for they were the fashion in New England where there were no Dutch. The tiles were six or eight inches square, of a white glazed earthenware such as table dishes are made of, and were ornamented with figures of various kinds. There was usually a border of ornamental work, and in the middle

AN OLD DUTCH TILE.

a figure-piece of some kind, all done in black, blue, or other color. Sometimes these tiles had the pictures so arranged one after another as to tell a Scripture or some other story; sometimes they had no relation to one another, and they were often quite funny. The writer recollects, when a child—oh! so long ago!—of sitting before grandmother's fireplace and trying to guess what these tiles were trying to tell. But all are gone now—house, tiles, grandmother, and all but the memory of the child sitting and wondering at the tiles. You may suppose that we were pleased to see a drawing which one of our artists made of one of these tiles which he came across in a collection of curiosities. It brought back the things of long ago; and we thought that you would like to see the picture of this tile and know about this odd custom of our grandparents and great-grandparents for many generations back.

A Neat Puzzle.—We have not had any puzzles lately, and this, which is a very simple one when you know how it is done, is really a puzzle to those who have never seen it. The puzzle is to take a piece of stiff paper, card-board, or leather, five inches long and three inches wide, and so cut the piece so that you can pass through it. This column that you are reading is just two and a half inches wide, so that will help you to form an idea of the size of the piece if you have not a measuring rule at hand. We will let you puzzle over this until next month. It is easily done if you know how.

Aunt Sue's Puzzle-Box.

HIDDEN NAMES OF ANCIENT GRECIAN DEITIES.

1. How diligent the ant is.
2. I have only been once to New York.
3. This, sir, is one of your manufacture.
4. Was Oliver there when you left?
5. Before you go I should like you to take a nap, Anna.
6. I wish you would go to the shop, Sam, and bring me some wire.

PUZZLE.

To make a man's name, take one-third of the sun, one-quarter of a band, one half of a mule, one-fifth of the earth, and one-quarter of a colt.

F. SCHWANMAN.

NUMERICAL ENIGMAS.

1. I am composed of twenty-six letters.
My 4, 24, 17, 13 is a coin.
My 19, 11, 20 is a stamp.
My 6, 18, 21, 14, 3, 9 is a marsh.
My 16, 22, 21, 26 is to repair.
My 12, 25, 1 is a quadruped.
My 2, 15, 7, 8, 21, 20 is to damage.
My 10, 5, 23, 13 is to carry.
My whole is a motto of one of the United States. **ELKIM.**
2. I am composed of twenty-six letters.
My 9, 1, 4, 16 is a mineral.
My 19, 22, 24, 26, 10 is to perch.
My 2, 6, 12, 14 is endless.
My 5, 15, 20, 25 is a young lady.
My 17, 13, 2, 19, 6, 7, 8 is a fish.
My 26, 10, 11, 3, 5, is an article of furniture.
My 24, 23, 18, 21 often causes terror to the superstitious.
My whole is a well-known proverb. **KATE McCUNE.**

SQUARE WORDS.

1. Square the word "CORD."
2. Square the word "DISH."

My seventh is in thick but not in thin.
My eighth is in needle but not in pin.
My whole a lovely place I ween,
In Italy it may be seen. **J. M. IRVIN.**

ANSWERS TO PUZZLES IN THE APRIL NUMBER.

NUMERICAL ENIGMA.—Robin redbreast.
HIDDEN COUNTIES.—1. Ford. 2. Scott. 3. Pope. 4. Sallie. 5. Stark. 6. Hardin. 7. Gallatin.

PI.—If you wish to be happy yourself try to make others happy.

East produces a sticky substance upon its stem and leaves which, if swallowed or smoked, produces a remarkable kind of intoxication. A person under its influence sees wonderful visions and is for awhile in a most happy state. One of the names for this drug is hashish or hasheesh. About 800 years ago there was in Persia, Syria, and Arabia a remarkable secret society or order, happily long ago broken up, as it was kept up for the most wicked purposes. Every member of it had to swear perfect obedience to his superiors, and if told to kill another, or to kill himself, he was obliged to do it. A great many secret murders, even of sultans and other officers, were committed by the members of this wicked crew. In order to get those who joined this society to take the horrid oaths that bound them, they were made drunk with hashish; they were given to "hashishin," as the using of hashish was called, and as the hashishins often killed people, the name was also used for murderers. It is by this round-about way we get our English word assassin. **THE DOCTOR.**

SUNRISE.

Goats.—An Ohio boy, ten years old, having seen our account of goats, has written to know if we can get him a pair. We are sorry to tell Master Ira that we can not do this, for two reasons. In the first place, we do not make purchases of this kind for any one. We have not the time. If we wished a pair of goats ourselves we should pay a person to go and hunt them up for us. In the second place, we do not think that youngsters of ten are the best judges of what they ought to have, and if we knew where to get goats we should not help our young friend to introduce the troublesome things upon his father's farm. We have no doubt that a pair of goats would in one season do damage to the amount of the value of a good horse. Master Ira says he has already a colt and a yoke of steers, which we think ought to satisfy him for awhile.

An Apology is needed to those boys and girls who last month looked for the apple that the boy, in the picture called "Making an Acquaintance," had brought to the calf. We looked at the drawing hurriedly before writing about it, and were quite sure there was an apple in the boy's hand. Perhaps the artist altered his mind after we saw a mistake of ours—but, at any rate, that boy might, could, or should have had an apple in his hand with which to make friends with the little calf.

Sunrise.

Here is a picture for little girls—and by the way we do not know of any reason why little boys, and big ones, too, may not like it. The artist had seen the sun rise bright and clear, driving away the darkness and making all the world look pleasant, and naturally enough when he saw this little girl rise up from her sleep he thought of the sun, and he called his picture "Sunrise," for she in the little world of the family brought brightness, and seemed, as many little girls are, the light of the house. We, unless we are all, all of us rise every morning as regularly as the sun. The sun is always bright and shining somewhere, though clouds may prevent us from enjoying his warm rays; yet when there are the thickest clouds he gives some light through them. But do our little girls always rise with brightness? They are sometimes dim; the clouds do not hide their light, the darkness is in themselves. No doubt this little girl in the picture, who begins the day aright, will keep pleasant and sunshiny all the day long. It is a good thing for all of us to start right in the morning, and let our presence be to our friends as welcome as the sunshine. This picture is from a beautiful bas-relief, but we shall have to tell what that is another time.

BLANKS.—1. Write, rite. 2. Cypress, Cyprus. 3. Pare, pair. 4. Principal, principle. 5. Air, heir. 6. Bawl, ball.

A Curious Origin of an English Word.

When answering the question about currants last month, I happened to think of a word that has a curious origin. In order to tell you about this I must state that the hemp which grows in India and other parts of the

Life Insurance.

"What is he worth?" is the question by the answer to which, in this somewhat mercenary world of ours, a man's standing, reputation, ability—himself, in short—is measured. Whether the gauge be a true or false one, whether by its application genuine worth be often made of no esteem, and tinselled vice be adjudged virtue, still the fact remains; this is the popular standard of man's true merit; and we all, to a greater or less extent, in spite of our counter-protestations, accept and are governed by it. Even while on our lips may be the trite quotation, "Worth makes the man, the want of it the fellow," we turn contemptuously away from the "man" because he is poor, to effusively greet the "fellow," because he is rich! We note the fact, and pass it with the commentary, "Such is life."

But, apart from all this, every man, every working man, in whatever department of labor, has a money value. He can be ciphered up and reduced to dollars, and that without reference to the money he has accumulated. The commonest laborer, although he own not a foot of real estate, or an article of personal property, save such as are indispensable to himself or family, has, nevertheless, a money value; he is worth something in currency. He is a capitalist; he has that in him which yields a revenue. His muscle and the skill which directs it are stock. The pay which he receives at stated times is the interest on his investment. Suppose his wages to be \$1.50 per day; then, making no allowance for loss of time by sickness or other disability, he receives annually, as interest upon his capital, \$469.50. Taking the average rate of interest as eight per cent, this income represents a capital of \$5,868.75. The actual worth of this capital—its actual amount, if you please—is reduced by the liability of its possessor to disease or accident. But, these apart, the money value of the day-laborer, working at the rate named, may be set down at very nearly \$6,000. This represents what he is worth in money to himself and those dependent upon him for support.

The mechanic, whose skill and labor yield a return twice as large as that of the day-laborer, has a capital twice as large—is worth twice as much.

The money value of the active professional man is greater than that of the mechanic, because he has more capital invested, and his labor brings him more money. As the marketable value of the skill and labor employed in any of the various avocations of life increases, so does the money worth of the worker in that avocation increase. And, generally, for each additional \$1,000 of income earned by a man for his family, his money value is increased by \$12,500.

This value should be protected by insurance, as much as any other value. The man who fails to insure his goods in store gets little credit, and finds no sympathy when calamity overtakes him. But what creditor has such demands as wife and children? Who have bestowed more? Who have exacted less?

The duty of providing the family against the contingencies of his early death is one which no husband or father can honestly neglect. And among all the places where that duty can safely and satisfactorily be performed, none is more secure, more liberal, more desirable than with the United States Life Insurance Company, of this city. Its solvency is undoubted; its record stainless; and its present management all that could be desired.

Boys We desire to employ for the next 2 years a boy or girl from 14 to 18 years of age in every township in the U. S., to sell our popular books.

Consumers Importing Tea Co.,
No. 8 Church Street,
P. O. Box 5,509. New York City.

This is a combination of capitalists to supply the consumers of Teas throughout the United States on the mutual principle.

We have experienced agents in all the best districts of China and Japan to select Teas especially for our trade.

We expect every consumer of Teas to render us all the assistance they can in carrying out our enterprise, as we make a specialty of **SUPPLYING CONSUMERS ONLY** (and allow no middlemen to make any profit on our importations), which will enable us to supply them with Teas at prices lower than have ever been known, and of those fine qualities that seldom reach the interior, being sold only in the large cities and among the very wealthy.

Hoping the consumer will take an interest in our enterprise, and send at once for a circular with full explanations of how to proceed to obtain our goods, we remain,

Most respectfully yours,

Consumers Importing Tea Co.,
No. 8 Church Street,
P. O. Box 5,509. New York City.

Entered, according to Act of Congress, in January, 1874, by the Consumers Importing Tea Co., in the Office of the Librarian of Congress, Washington, D. C.

IMPORTANT TO FARMERS,

PLANTERS, PRINTERS, BREWERS, AND ALL USING STEAM POWERS.

ANDERSON'S PATENT STEAM BOILER AND KIPP'S NEW ENGINE.

Best and Cheapest in the World! HIGHEST AWARD.

Large Silver Medal at American Institute Fair, fall of 1873, for the best Portable Steam Boiler, 2 to 12 Horse Powers. Also, 1st and Highest Premiums at seven State Fairs and Expositions.

THIS IS NOT A FLUE BOILER.—It is a boiler within a boiler, the two connected together, and presenting an immense amount of heating surface to the fire, and also securing the **Greatest Strength, Durability, and Effectiveness** of any Steam Boiler yet introduced. Over 150 put in on trial, and never lost a sale.

25 to 30 per Cent Saved in Fuel—Five Sizes—2 to 10 Horse Power.—Will raise steam from cold water to 60 pounds pressure in 10 to 12 minutes. **The Most Economical Combination Extant. Feeds itself from a Tank,** and requires no more attention than an ordinary stove, and is just as safe. The engine is of the simplest possible form; the cylinder, bed, frame, guides, and bearings, being all cast in one piece, can not get out of line.

Carbonized Enamel

IS AS PURE AS GLASS.

The Bridgeport M'fg Co.,
 OF BRIDGEPORT, CONN.

(Office, No. 88 Chambers St., New York). Have the exclusive control of this valuable enamel, and are using it to cover all of their celebrated

American Submerged Force Pumps.

They also *enamel pipe* inside and out, which delivers the water chemically pure. The enamel is composed of vegetable matter, baked on so hard that a blow does not break it, and it resists acids that eat gold.

Gentlemen: I have examined the sections of Carbonized Enamel Pipe submitted to me by you. It is superior to any pipe I have ever seen for resisting acids and conducting water from springs or for use in connection with pumps, etc. The Enamel adheres with astonishing tenacity, withstanding even heavy blows; and the surface of the metal where the enamel is beaten off seems to be protected against the ordinary action of water.

M. C. WELD,

Late Associate Editor *Am. Agriculturist.*

MUDGE & WOODS, No. 88 Chambers St., N. Y., are the exclusive selling agents of the Bridgeport M'fg Co. for the Licenses of States, counties, and towns rights for the American Submerged Suction and Force Pumps.

THE PULSOMETER.

The simplest, most durable, and effective steam pump now in use. Will pump gritty or muddy water without wear or injury to its parts. It can not get out of order.

The second edition ready. Book canvassers can still secure territory, and make money in spite of "hard times." Send for prospectus.
UNITED STATES PUBLISHING CO.,
13 University Place, New York.

AGENTS WANTED for the book **'Tell It All'**

By Mrs. T. B. H. Stenhouse, for 25 years wife of a Mormon High Priest. With introduction by Harriet Beecher Stowe. Two years ago the author wrote a pamphlet on Polygamy which excited the Mormon newspapers to sneeringly invite her to write a book and "Tell It All." The clergy and eminent men and women urged her to accept the challenge. She did so, and "Tell It All" is the result. It is a work of extraordinary interest, full of startling revelations, truthful, bold, and good. The only book upon this subject ever written by a real Mormon woman. The story of "Eliza Ann, Wife No. 19," is told in full by herself. 625 pages, superbly illustrated and bound. It is the most popular book ever sold by agents, outselling all others three to one. It takes like wildfire. \$1.00 will be sold. Steady work or for spare hours for men or women—\$25 to \$200 a month easily made. Descriptive pamphlet, terms, &c., sent free to all, will prove this. Address A. D. WORTHINGTON & Co., Hartford, Conn.

Do you want Employment

We will give you immediate, steady, honorable work, which will pay you beyond all your expectations. Thousands at work for us are now making from \$100 to \$300 per month, and thousands more can do it. The business is in introducing our publications in your own and other towns. With **MARY TWAIN'S** or **JOSH BILLINGS'S** new works, with "MY OPINIONS AND BETSEY BOBBET'S," and with many others out of our list, you can secure a fine income easily. Write us for information. We send it full and free. Address
AMERICAN PUBLISHING CO., Hartford, Conn.

"**EDEOGRAPHY.**" A new book on the art of Writing by Sound; a complete system of Phonetic Short Hand—the shortest, most simple, easy, and comprehensive, enabling any one, in a short time, to report trials, speeches, sermons, &c. The Lord's Prayer is written with forty-nine strokes of the pen, and 140 words per minute. The unemployed should learn this art. Price, by mail, 50 Cts. Agents wanted. Address T. W. EVANS & CO., 139 S. Seventh Street, Phila., Pa.

AGENTS WANTED, everywhere, for **The Home of God's People.**

One of the most singularly attractive, valuable and interesting works ever issued. Every family needs and will have it. It has proved itself to be the best paying book extant, and an energetic male agent will make \$2,500 a year, taking orders for it. Our circulars (sent free) will give you our exceedingly liberal terms, full particulars, endorsements, &c. Old Agents, or any one desiring a lucrative business, will do well to write us at once. Address,
DUS. IN, GILMAN & CO., Hartford, Conn.

The Best Work Ever Issued for Farmers, Carpenters, and Mechanics, is

BELL'S Carpentry Made Easy.

It is useful to all who have barns, bridges, and out-houses to build, as it treats on the science and art of Framing on a new and improved system, with specific instructions for building Balloon Frames, Barn Frames, Mill Frames, Warehouses, etc.

Nicholson says of "Carpentry":
"With an experience of more than twenty-four years at carpentering, I may say it is the best work of the kind I have ever had the good fortune to meet with, as it gives more information for the amount of money, either to Master Workman or Journeyman, the principles being so different from other works of the kind, yet so plain that any apprentice should be able to comprehend them in a short time."
JOHN J. NICHOLSON.

Another Carpenter says: "It is just the book for a young beginner."

PRICE, \$5.00, Prepaid.
HOWARD CHALLEN, Publisher, Philadelphia, Pa.

paid, \$1.50.

ORANGE JUDD COMPANY, 245 Broadway, N. Y.

A Man of Honor.

By **GEORGE CARY EGGLESTON.**

Finely Illustrated.

The publishers take pleasure in commending this as
one of the most charming stories that has been presented
to the American people. Mr. Eggleston has given to it,
with rare fidelity, the local coloring of the part of the
country where its scenes are laid. It is a realistic story
of life in the Old Dominion. Its people are ladies and
gentlemen. Robert Pagebrook, the "Man of Honor," is
every inch a man, and his sayings and doings at once at-
tract and hold the reader's attentive interest. It is a
love-story, too, and has the merit, which is not as com-
mon as it might be nowadays, of ending to the reader's
entire satisfaction.

NOTICES BY THE PRESS.

A capital picture of Life in Old Virginia before the war is
to be found in Mr. George Cary Eggleston's "A Man of
Honor." Virginian hospitality, Virginian cousinship, Vir-
ginian housekeeping, are portrayed in accurate and attrac-
tive colors. It is a life which the author has himself known
and loved, and he writes of it with a warmth that comes
from the heart.—*N. Y. Evening Post.*

Really readable in the most refreshing sense of the term—
a story of the most amusing and attractive interest.—*St.
Louis Times.*

It is written in an off-hand manner, and is bright and
amusing.—*Worcester, Mass., Spy.*

With Virginian life as a specialty, Mr. Eggleston has drawn
a simple, straightforward, truthful, and withal, artistic pic-
ture of Southern society. It is sketchy, perhaps too much
so, but the sketches are all vigorous and show the hand of a
practiced artist. In forming the characters of his book it is
evident that Mr. Eggleston has drawn oftener on his memory
than on his imagination; that he has lived among the people
whom he describes, has heard them talk, and seen them
under all the moods of ordinary life.—*Boston Daily Adver-
tiser.*

CONTENTS.

Chapter 1. Mr. Pagebrook gets up and calls an Ancient
Lawgiver.—2. Mr. Pagebrook is Invited to Break-
fast.—3. Mr. Pagebrook Eats his Breakfast.—4. Mr.
Pagebrook Learns Something about the Customs of
the Country.—5. Mr. Pagebrook Makes some Acquain-
tances.—6. Mr. Pagebrook Makes a Good Impression.
—7. Mr. Pagebrook Learns Several Things.—8. Miss
Sudie Makes an Apt Quotation.—9. Mr. Pagebrook Meets
an Acquaintance.—10. Chiefly Concerning "Foggy."—
11. Mr. Pagebrook Rides.—12. Mr. Pagebrook Dines
with his Cousin Sarah Ann.—13. Concerning the Rivu-
lets of Blue Blood.—14. Mr. Pagebrook Manages to
be in at the Death.—15. Some very Unreasonable
Conduct.—16. What Occurred Next Morning.—17. In
which Mr. Pagebrook Bids his Friends Good-by.—18.
Mr. Pagebrook Goes to Work.—19. A Short Chapter,
not very Interesting, perhaps, but of some Importance
in the Story, as the Reader will probably Discover after
awhile.—20. Cousin Sarah Ann Takes Robert's Part.
—21. Miss Barksdale Expresses some Opinions.—22.
Mr. Sharp Does his Duty.—23. Mr. Pagebrook Takes
a Lesson in the Law.—24. Mr. Pagebrook Cuts Himself
Loose from the Past and Plans a Future.—25. In which
Miss Sudie Acts very Unreasonably.—26. In which Miss
Sudie adopts the Socratic Method.—27. Mr. Pagebrook
Accepts an Invitation to Lunch and Another Invitation.
28. Major Pagebrook Asserts Himself.—29. Mr. Barksdale
the Younger goes upon a Journey.—30. The Younger
Mr. Barksdale Asks to be Put upon his Oath.—31. Mr.
William Barksdale Explains.—32. Which is also the
Last.

Glad as a Boy with Red Morocco Tops to his Boots."

PRICE, POST-PAID \$1.25

**ORANGE JUDD COMPANY,
245 BROADWAY, NEW YORK.**

**DON'T FAIL
TO HAVE A LIBRARY.
GOOD BOOKS
For Farmers' Libraries.**

In response to a request made of one whose thorough and practical knowledge on all matters pertaining to the Farm, Garden, and Household is so fully conceded that his opinions could not fail to secure attention and command respect were we permitted to give his name, we have received the following as his judgment concerning some of the works on our Catalogue of Books for Farmers.

Any of these Books will be forwarded, post-paid, to any address in the United States or Territories, on receipt of the price, by Orange Judd Company, 215 Broadway, New York.

For a Farmer's Library.

How Crops Grow,
(price \$2.00), and

How Crops Feed,
(price \$2.00.)

By Prof. SAM'L W. JOHNSON.

If I could have but two books in such a library it would be these, as I consider them the most important contributions to agricultural literature of modern times. They contain all of vegetable physiology and agricultural chemistry that any except special students need, and nowhere is there so much of agriculture condensed in so small a space. As works of reference they are indispensable.

Farm Implements and Machinery.

By JOHN J. THOMAS.
Price \$1.50.

Most farming operations are accomplished by force, applied through implements and machines, and a farmer should understand mechanics, at least sufficiently to apply force most economically. In this work the fundamental principles are clearly taught, and their application illustrated.

The New American Farm Book.

By R. L. and L. F. ALLEN
Price \$2.50.

This is the best American work upon general farm management. It treats of the leading crops, buildings, draining, etc., and includes sufficient about animals of different kinds to meet the wants of most farmers.

American Weeds and Useful Plants.

By DR. WM. DARLINGTON.
Price \$1.75.

For the farmer who wishes to know something about the weeds upon his farm, as well as useful cultivated and wild plants, this will answer better than a general treatise on botany.

Country and Suburban Homes.

By D. T. ATWOOD.
Price \$1.50.

Such a library should have some work on domestic architecture. Most works upon the subject are costly on account of the designs. This is one of the best works, at a moderate price, and contains, with other matter, the method of building with concrete.

The Fruit Garden.

By P. BARRY. Price \$2.50.

After the farm crops, fruit is of the most importance. No work covers the whole subject so completely as this.

Gardening for Profit.

By PETER HENDERSON.
Price \$1.50.

Farms near cities often make more from garden crops than from farm crops. This is the best work on market gardening, and will serve for the family garden also.

Gardening for the South.

By WM. N. WHITE.
Price \$2.00.

An excellent garden book, and in the libraries for Southern farmers might be substituted for Henderson's, but it would be well to have both.

The New Book of Flowers.

By JOSEPH BRECK.
Price \$1.75.

I do not know of any book upon out-door flower gardening that on the whole is so good as this. Its teachings are sound, and style pleasing.

Mysteries of Bee-Keeping.

By M. QUINBY. Price \$1.50.

Practical Poultry-Keeper.

By L. WRIGHT. Price \$2.00.

The Pig.

By JOSEPH HARRIS.
Price \$1.50.

Draining for Profit.

By GEO. E. WARING, JR.
Price \$1.50.

Dairy Husbandry.

By X. A. WILLARD.
Price \$3.00.

Bees, Poultry, and Pigs are often made subjects of especial care by small farmers, and separate treatises on these are more likely to be asked for in a library like this than those upon the larger animals. Each of these is the best in its line.

So in farm operations, those of Draining and Dairying, especially the factory system, are not likely to be treated sufficiently in detail in general works.

As all the other works are matters of fact, it may be well to have a little pleasure. This conveys much sound teaching on rural economy in a quaint style, and it is sometimes policy to sugar-coat your pill.

Tim Bunker Papers.

Price \$1.50.

Books for a Larger Library.

Besides all the works in the foregoing list, I would add the following:

- American Cattle.** L. F. ALLEN. \$2.50.
- Randall's Sheep Husbandry.** \$1.50.
- Hints to Horse Keepers.** H. W. HERBERT. \$1.75.
- American Cattle Doctor.** G. H. DADD. \$1.50.
- Insects Injurious to Vegetation.**
DR. HARRIS. \$4.00.
- Fruits and Fruit Trees of America.**
DOWNING. \$5.00.
- Cranberry Culture.** J. J. WHITE. \$1.25.
- Grape Culturist.** A. S. FULLER. \$1.50. (For the West would substitute Husman's Grapes and Wine. \$1.50.)
- Grasses and Forage Plants.**
C. L. FLINT. \$2.50.
- Forest Trees.** ARTHUR BRYANT. \$1.50.
- Landscape Gardening.** KEMP. \$2.50.
- Hops.** 40 cts. **Flax.** 50 cts. **Tobacco.** 25 cts. **Onion.** 20 cts. Essays.
- Boussingault's Rural Economy.** \$1.60.
- Play and Profit in My Garden.** ROE. \$1.50.
- Window Gardening.** WILLIAMS. \$1.50.

Books for a Still Larger Library.

In addition to those mentioned in the other two lists, I would name the following.

- Animals and Plants under Domestication.** 2 vols. CHAS. DARWIN. \$6. (This not suggested for its doctrine, but as a useful work of reference.)
- Hussey's National Cottage Architecture.** \$6.
- Landscape Gardening.** DOWNING. \$6.50.
- The Vegetables of America.** F. BURR. \$5.
- The Book of Evergreens.** J. HOOPES. \$3.
- Trout Culture.** DR. SLACK. \$1.50.
- Farm Gardening & Seed Growing.** BRILL. \$1.
- The Dog.** DINKS, MATHEW & HUTCHINSON. \$3.
- Young Sportsman's Manual.** FORRESTER. \$3.
- Hunter and Trapper.** H. THRASHER. \$1.
- The Market Assistant.** DEVOE. \$2.50.
- Hedges and Evergreens.** WARDER. \$1.50.
- Pear Culture.** P. T. QUINN. \$1.
- Money in the Garden.** QUINN. \$1.50.
- How Plants Grow.** GRAY. \$1.25.
- How Plants Behave.** GRAY. 75 cts.
- Illustrated Horse Doctor.** MAYHEW. \$3.
- Peach Culture.** FULTON. \$1.50.
- Barns, Out-Buildings & Fences.** HARNEY. \$6.
- Cottages and Farm Houses.** WOODWARD. \$1.50.
- Country Homes.** WOODWARD. \$1.50.

Newly Revised and Enlarged Edition.

Practical Floriculture.

A Guide to the Successful Propagation and Cultivation of Florists' Plants.

By PETER HENDERSON,
Author of "Gardening for Profit."

Beautifully Illustrated. Price, Post-paid, \$1.50.

In this work, which has everywhere become so deservedly popular, not only is the whole "art and mystery" of propagation explained, but the reader is taught how to plant and grow the plants after they have been propagated. The work is not one for florists and gardeners only, but the amateur's wants are constantly kept in mind, and we have a very complete treatise on the cultivation of flowers under glass, or in the open air, suited to those who grow flowers for pleasure as well as those who make them a matter of trade. The work is characterized by the same radical common sense that marked the author's "Gardening for Profit," and it holds a high place in the estimation of lovers of floriculture. The new edition has been thoroughly revised by the author, and much enlarged by the addition of valuable matter.

The following are a few of the subjects embraced in the latest edition:

Laying out Flower Garden and Lawn; Designs for Grounds and for Greenhouses; Soils for Potting; Cold Frames; Hot-Beds; Greenhouses Attached to Dwellings; Modes of Heating; Propagation of Plants by Seeds and by Cuttings; Culture of the Rose and Tuberoses; Growing of Winter-flowering Plants; Construction of Bouquets, Baskets, etc.; Parlor and Window-Gardening; Wardian-Cases and Ferneries; Insects; What Flowers Grow in the Shade; Culture of Grape-Vines under Glass; The Profits of Floriculture; How to Become a Florist, etc., etc.

**THE ILLUSTRATED
Book of Poultry,**

With Practical Schedules for Judging, Constructed from Actual Analysis of the Best Modern Decisions.

By LEWIS WRIGHT,

Author of "The Practical Poultry Keeper," "The Brahma Fowl," etc.

**ILLUSTRATED WITH
Fifty Colored Portraits of Prize Birds,
Painted from Life by J. W. Ludlow.**

CONTENTS.

- | | |

ORANGE JUDD COMPANY,
245 BROADWAY, NEW YORK.

DOANE COLLEGE, IN SOUTH PART OF CRETE, NEB.

This is a fair representative view of Valley, Rolling Prairie, and Timber Lands for over sixty miles in Gage, Salina, Seward, and Butler Counties, in Nebraska.

**IF YOU WANT A FARM OR HOME,
YOU SHOULD BUY OF THE
BURLINGTON AND MISSOURI RIVER RAILROAD CO.
IN IOWA OR NEBRASKA.**

- BECAUSE**—Their prices are low, ranging for the best land from Three to Ten Dollars per acre.
- BECAUSE**—No payments are required of the purchaser for four years, except interest at six per cent.
- BECAUSE**—After the fourth year only one seventh of the principal is payable annually till the whole is paid.
- BECAUSE**—You are not required to go into a wilderness, these being well-settled States, the population of which is rapidly increasing.
- BECAUSE**—The mildness of the climate and fertility of the soil is such that the settler can pay for his farm from the products raised upon it long before the time when the principal becomes due.
- BECAUSE**—Failure of crops from drouth is unknown.
- BECAUSE**—Large allowances are made upon fare and freight, thus giving low rates on both to purchasers of this Company's lands.

AND YOU SHOULD BUY THIS YEAR.

BECAUSE—Purchasers of our lands in Nebraska during 1871 who cultivate one-half their land within two years from their purchase are allowed a reduction of twenty per cent on its price. **LARGE DISCOUNTS** also, FOR CASH, within One, Two, or Five Years.

Send for Circulars, with full information on all points, to

CEO. S. HARRIS, Land Commissioner,
At Lincoln, Nebraska, for land in Nebraska. At Burlington, Iowa for land in Iowa.

HOW TO MAKE MONEY AT HOME. 60 pp. Book free. J. JAY GOULD, Boston, Mass.

THE HOOSIER SCHOOL-MASTER.

By EDWARD EGGLESTON.

Finely Illustrated, with 12 Full-Page Engravings, and Numerous Other Cuts.

NOTICES BY THE PRESS.

It is full of quaint humor, a tender pathos, and vivid descriptions.—*New York Standard*.

The "events" are stirring and dramatic, and the style is quiet, impersonal, and almost epigrammatic in its ability to lay bare an entire situation or character in a sentence or phrase.—*Brooklyn Daily Eagle*.

It is at once quaint and truthful, and illustrated as it is by masterly cuts, it should be one of the most popular books.—*Christian Standard* (Cincinnati).

For realistic conception and life-like delineation of character, it is not excelled by any American story.—*Methodist*.

Some passages in it, for life-like delineation and the simple, artless beauty which constitute the highest perfection of story-writing, are equal to some of the very best passages in Dickens.—*Religious Telescope*.

PRICE, POST-PAID.....\$1.25.

The End of the World.

A LOVE STORY.

By EDWARD EGGLESTON,

Author of "The Hoosier School-Master."

WITH

Thirty-two Fine Illustrations.

NOTICES BY THE PRESS.

The personages who figure in this story are, with one exception, country people—such men and women as Wordsworth loved to study. It is not every man, whatever may be his talents, that can safely enter this sphere of literary labor. To be successful in it, he must possess exceptional qualities; but for those who know how to find it, here there is gold of the purest, richest kind. In such a work, however, there is no convenient place where mediocrity can rest; there is nothing but absolute failure or absolute success. And Mr. Eggleston has succeeded. His power lies in the delineation of character. The plot is ingenious and natural, the incidents are managed with great skill, and there are many descriptive passages of singular force and beauty. But the strongest impression left on the reader's mind as he closes the volume is that he has been in the company of very interesting men and women, and has made a number of new and valuable acquaintances.—*The Albion*, New York.

Price, Post-paid, \$1.50.

The Mystery

OF

Metropolisville,

By EDWARD EGGLESTON,

Author of "The Hoosier School-Master," "The End of the World," etc.

THE PRACTICAL POULTRY KEEPER.

A COMPLETE AND STANDARD GUIDE TO THE

MANAGEMENT OF POULTRY,

FOR DOMESTIC USE, THE MARKETS, OR EXHIBITION.

Beautifully Illustrated.

By L. WRIGHT.

NOTICES BY THE PRESS.

This book is a valuable manual for everybody who feeds chickens or sells eggs. It suits at once the plain poulterer who must make the business pay, and the chicken fancier whose taste is for gay plumage, and strange, bright birds. The most valuable portion is the first section, extending through fifty-five pages. These were written with the intention of producing a manual so plain, minute, and practical, that any one could, by using it as a guide, with no previous experience with poultry, become at once successful in producing eggs, young chickens, and fat fowls for market. The author has not missed his aim. The middle parts of Mr. Wright's Manual are taken up with minute directions for making show fowls for Fairs, a nice discussion of the good and bad points of the different breeds, and a brief sketch of such fancy stock as peafowl, pheasants, and water-fowl. Then follows a section on artificial hatching, and another, worth special attention, on large poultry yards.... A study of Mr. Wright's book will convince any farmer's wife that all she needs is to give a half hour each day, of intelligent and sagacious attention to her poultry, in order to obtain from them, not tape, and knitting needles, and buttons, and nutmegs merely, but the family supplies of sugar, shoes, and cloth. *New York Tribune*.

It is the most complete and valuable work on the matters of which it treats yet published. It will be found a plain and sufficient guide to any one in any circumstances likely to occur, and is illustrated with elegant engravings of many breeds of fowls. *Farmers' Cabinet*.

This is a reprint, with numerous wood engravings, of an English book, the object of which is to convey in plain language a great deal of practical information about the breeding and management of poultry, whether for domestic use, the markets, or exhibition.... The book is eminently practical, and we recommend it to farmers and others interested in breeding and selling poultry. *Philadelphia Press*.

It is a handsome volume, brought out in the best style, and enriched with nearly fifty illustrations. It is evidently the fruit of a thorough, practical experience and knowledge of fowls, and will be found a plain and sufficient guide in all the practical details of poultry management as a profitable business. *United Presbyterian*.

The subject is treated fully and ably by an experienced hand, and the volume will doubtless find a large sale among the growing class of poultry fanciers. It is embellished with numerous illustrative engravings. *New York Observer*.

The author has called to his aid all who were experienced in the subject whereof he writes, and the consequence is a volume of more than ordinary thoroughness and exhaustiveness. *Rochester Democrat*.

The book is a complete and standard guide to the management of poultry for domestic use, the market, and for exhibition. *Watchman and Reflector*.

PRICE, POST-PAID, \$2.00.

Field Philosophy.

Price, post-paid, Two DOLLARS.

Window Gardening.

By HENRY T. WILLIAMS,

EDITOR OF THE HORTICULTURAL, AND HORTICULTURAL EDITOR OF THE NEW YORK INDEPENDENT.

FINELY ILLUSTRATED.

There can be no more attractive ornaments about the house than beautiful flowers, and Mr. Williams's book tells exactly how they may be arranged, and what flowers to plant. It is seldom that a book is published on such subjects containing so much practical information. *The World* (New York).

CONTENTS:

Chap. 1.—Window Gardening—Its Pleasures—Increase in Popular Taste—Reining Influences. Chap. 2.—Location and Designs for Window Gardens. Chap. 3.—General Management of Window Gardens. Chap. 4.—Special Care of Window Gardens. Chap. 5.—Insects, and how to Kill them. Chap. 6.—Propagation from Seeds, Cuttings, etc. Chap. 7.—Propagating Boxes, Heating Cases, etc. Chap. 8.—Window Pots, Boxes, Plant Stands. Chap. 9.—Conservatories and Greenhouses. A Trochar for Cattle-Men.

In June of 1873 we gave illustrations of a Trochar and Cannula to be used in ringing a bull, and on page 13 (January) and page 97 (March) of last year's volume we described the use of this apparatus in relieving hoven in cattle. These articles have brought out a large demand for Trochars, and failing to find just the right kind among the makers of surgical implements, we have induced an establishment to undertake their manufacture. We give herewith a small engraving of the Trochar. These articles are now in the trade, and may be had of most dealers in agricultural implements. Those who can not get them from dealers can receive them from this office, post-paid, for \$1.00.

Address ORANGE JUDD COMPANY,
245 BROADWAY, NEW YORK.

CUMMINGS' Architectural Details.

CONTAINING

387 Designs and 967 Illustrations Of the Various Parts Needed in the Construction of Buildings, Public and Private, both for the City and Country.

ALSO, PLANS AND ELEVATIONS OF

Houses, Stores, Cottages, and Other Buildings.

BY

M. F. CUMMINGS, A.M., Architect,

Associate Author of "Architecture, by Cummings & Miller," and "Modern American Architecture, by Cummings & Miller."

Nearly eight years ago, the author of this work, in connection with Mr. C. C. Miller, architect, published a work on architectural details, which, as soon as it was presented to the architects, carpenters, and builders of the country, met with a rapid sale; and, judging from the number of editions through which it has passed, and the great circulation reached, it must have met the approval of those most interested in practical architectural works, and must have filled, in a measure, a want before unsupplied.

The success of that book has induced the author to publish a second one, which is now presented to the public, and in it will be found an extensive collection of designs illustrating the features which go to make up structures such as are needed to meet the wants of the American people.

What has been aimed at is this: To present a mass of architectural details, easy of construction, pleasing in form, and generally of an inexpensive character, and all so designed that a great variety of selections may be made from them, which, when combined in a building, will produce a harmonious whole; and it is believed by the author that this work will be found to be of value, and that its design is practicable, for there are hundreds of towns and villages, in all the States of the Union, in which the wants of the people continually demand the erection of buildings, largely of wood, and which in the hands of the builder and workman may be made elegant and pleasing in all their features, provided they have at hand a guide such as this book is intended to be.

Royal Quarto. Price, post-paid, \$10.

JOHN ANDROSS.

BY

REBECCA HARDING DAVIS,

Author of "Life in the Iron Mills," "Dallas Calbraith," etc., etc.

ILLUSTRATED.

NOTICES BY THE PRESS.

The story is of intense interest, and holds the reader from its commencement to its close, and gives much food for thought regarding the workings of political rings and government frauds in our large cities.—Post, Salem, Mass.

The characters and their work are strongly but no doubt truthfully drawn. Aside from its literary merit, the book deserves credit for calling attention to a crying shame of our time.—Christian Advocate, Pittsburgh, Pa.

It will at once enchain the attention of the reader, and prove vigorously and skillfully written, by this among the foremost novel writers of America.—Commonwealth, Boston, Mass.

Of a story of Mrs. Davis it is hardly necessary to say that it holds the reader's absorbed attention from beginning to end. Though the interest of the plot is very considerable, it is subordinate to the higher interest of the description and development of character. There is a great deal of very life-like painting of people and manners.—Christian Union, New York.

The characters are well drawn, the incidents are full of interest, and the plot sustained with consistency and power.—Daily Spy, Worcester, Mass.

We are constantly struck with the out-cropping of the one golden thread that holds all her writings together, and never fails to shine through the web of whatever plot she weaves about it—that singleness of point and moral more characteristic of her writings than of any other we know of, and which is, broadly stated, a self-sacrificing devotion to duty.—Daily Standard, Bridgeport, Ct.

Her hero is a man entangled by the great Ring of Pennsylvania, who is sent by this corporation to the State Senate with a hold of criminality to keep him in hand, who even then attempts to break loose and join the party of honesty, but is at the crisis brought in check again by the Ring, with the still more potent motive of love. . . . The plot is very well wrought, and the denouement is powerfully conceived and managed.—New York Evening Mail.

Price, Post-paid, \$1.50.

ORANGE JUDD COMPANY, 245 BROADWAY, NEW YORK.

PRETTY MRS. GASTON, AND OTHER STORIES.

BY

J. ESTEN COOKE,

Author of "The Virginia Comedians," "Dr. Van Dyke," "Surry of Eagle's Nest," etc.

NOTICES BY THE PRESS.

The narrative is ever animated, and here and there touched with warm, tender, yet natural emotion.—College Courier, New Haven, Conn.

The principal figure of the story, the pretty widow Mrs. Gaston, is well drawn and attractive, and the author has displayed in the treatment of this character much care and ingenuity.—Boston Traveller.

The style of Mr. Cooke's writings is smooth and fascinating, and whoever commences the perusal of them will never regret the undertaking.—Westfield News Letter.

A romance with a most delightful complication of matrimonial purposes, as well as having a villain, forger, gambler and detective to assist in the action.—Boston Post.

The plot of the principal story is finely wrought out, full of incident, and there is a sort of fascination about the style, which claims the attention of the reader until the close.—Salem Gazette.

A very lively and amusing book.—Country Gentleman.

The story is written in popular style—a little plot, a little mystery, a little love—and is sure to attract a large number of readers.—Reading (Pa.) Eagle.

Price, Post-paid, . . . \$1.50.

ORANGE JUDD COMPANY, 245 BROADWAY, NEW YORK.

Beckwith Sewing Machines

\$12 and \$20.

We have offered as a Premium, and also for sale, for more than a year past, the Beckwith Sewing Machine, which has been fully described in previous numbers of this paper. We have already given and sold more than one thousand of these machines, and testimonials of satisfaction have come from every quarter.

We still offer the Beckwith Sewing Machine, Improved, price \$12. A new and very simple braiding-foot has been made, by which a child can sew on braid without the least trouble, following any desired pattern with ease; also a new arm, spiral spring and lever for raising the presser-foot, all of which are now set in a position that leaves the needle free to be threaded. The joint is much enlarged, and the machine is otherwise greatly strengthened and improved. The use of the braider-foot alone will be valued more than the cost of the machine.

Each of these machines is put in a neat, compact box, with hemmer and guide, oil-can with oil, thread, different-sized needles, etc., with full Printed Directions for using. On receipt of \$12 we will send one of these machines to any address, expressage to be paid by the purchaser.

The Machine as a Premium.

We will give one of these \$12 machines to any one who will collect and forward eight subscribers for *Hearth and Home* one year at \$3 each; or sixteen subscribers to *American Agriculturist* for one year, at \$1.50 each, expressage on the machine to be paid by the recipient of it.

THE BECKWITH PORTABLE FAMILY SEWING MACHINE.

PRICE \$20.

Enlarged and Improved. Its Weight is 7 Pounds.

While we continue the offer of the Improved \$12 Machine as heretofore, we now offer the new

PORTABLE FAMILY MACHINE,

price \$20, which comprises all the excellencies of the former, with many valuable improvements. Its size and power are increased, and its capacity thus very much enlarged, without impairing its portability. There have been added cam and eccentric movement, a balance-wheel, and also an oscillating needle-clamp, by which the length of stitch can with the greatest ease be changed to the finest shade of variation without touching the needle.

To any one sending us \$20, we will send one of the Machines (packed in a neat, portable case, with handle to carry it easily), expressage to be paid by purchaser.

The Machine as a Premium.

We will give one of these \$20 Machines to any one who will collect and forward to us Fifteen Subscribers to *Hearth and Home* for one year at \$3 each, or Thirty Subscribers to *American Agriculturist* for one year at \$1.50 each, or One Hundred at \$1 each, expressage on the Machine to be paid by the recipient of it.

Almost any lady can readily secure the small number of subscribers required to get either the \$12 or the \$20 Machine as described above; or some friend can thus obtain it for her as a present.

ORANGE JUDD COMPANY, 245 BROADWAY, NEW YORK.

DO GOOD

AND

MAKE

MONEY.

The Publishers of American Agriculturist and HEARTH AND HOME take pleasure in presenting in the adjoining Table, their new general Premium List for 1874. The Premiums which they have offered in past years have engaged the attention of a very large number of persons of all ages and both sexes. Many thousands have secured Premiums, and very many of these, who at first had small hopes of success, have been themselves astonished at the ease with which they have raised large clubs and secured valuable Premiums.

Here is pleasant and profitable work for all. Any one who wishes to do good and make money, can do both by going to work as here invited by the publishers of these two most valuable journals, American Agriculturist and HEARTH AND HOME. You need only to show specimens of the papers, promise the beautiful Chromos, which are now ready for delivery, according to the publishers' offer, and forward your subscriptions. TRY IT.

Explanatory Notes.

N. B.

Read and carefully

Note the following Items: (a) All subscribers sent by one person commit, though from one or a dozen different Post-offices. But... (b) Tell us with each name or list of names sent, that it is for a premium.... (c) Send the names as fast as obtained, that the subscribers may begin to receive the paper at once. You can have any time, from now until July 1st, to fill up your list.... (d) Send the exact money with each list of names, so that there may be no confusion of money accounts.... (e) Old and new subscribers all count in premium clubs, but a portion, at least, should be new names; it is partly to get these that we offer premiums to canvassers.... (f) Specimen Numbers, etc., will be supplied free as needed by canvassers, but they should be used carefully and economically, and where they will tell.... (g) Remit money in Checks on New York Banks or Bankers, payable to order of Orange Judd Company, or send Post-office Money Orders. If neither of these is obtainable, Register Money Letters, affixing stamps both for the postage and registry; put in the money and seal the letter in the presence of the Post-master, and take his receipt for it. Money sent in any of the above ways is at our risk; otherwise it is not.

[In the following table is given the price of each article, and the number of subscribers required to get it free, at the regular rates, \$1.50 a year for American Agriculturist, and \$3.00 a year for Hearth and Home; also at the club rates of \$1 and \$2.50; also at the rates of \$4 a year for both papers together.] Description of Premiums sent free to applicants.

N. B.—In all Premium Clubs for either paper, TWO copies of American Agriculturist (English or German) at \$1.50 each, and ONE copy of Hearth and Home at \$3.00, will count exactly the same. So also two copies of American Agriculturist at \$1 each, and one copy of Hearth and Home at \$2.50, will count exactly the same. In this way Premium Clubs can be made up from the 2d and 4th columns, or from the 3d and 5th, or wholly from the 6th column.

Table of Premiums and Terms For American Agriculturist, and for Hearth and Home, for the Year 1874.

Open to all—No Competition.

Table with 6 columns: No., Names of Premium Articles, Price of Premiums, American Agriculturist only, and Hearth and Home only. Includes items like Moore's Floral Set, Gold Pen, Revolving Pencil, and various sewing machines.

Every Premium article is new and of the very best manufacture. No charge is made for packing or boxing any article in our Premium List. The Premiums, Nos. 2 to 8, 27 to 33, 55 to 78, and 81 to 93, inclusive, will each be delivered FREE of all charges, by mail or express (at the Post-office or express office nearest the recipient) to any place in the United States or Territories.—The other articles cost the recipient only the freight after leaving the manufactory of each, by any conveyance desired. Description of Premiums sent free to applicants.

"UP FOR REPAIRS,"

A Beautiful, New Picture for Every Subscriber to the

American Agriculturist

FOR 1874.

An exquisite Oil Painting by the celebrated American Painter, Mr. B. F. Reinhart, executed expressly for the American Agriculturist and entitled

"UP FOR REPAIRS,"

has been most successfully reproduced in Chromo by the well-known firm of Bencke & Scott. It is a picture of a scene in childhood, which many will recognize as what they have themselves witnessed or been actors in, and can not fail to please both old and young.

The Publishers will give this beautiful Chromo

To Every Subscriber

to this paper for the year 1874 received after this date, as detailed below. It is ready for immediate delivery at 245 Broadway, Free of Charge.

If to go by mail, 10 cents must be sent to cover cost of packing and postage. For 25 cents it will be Mounted, Varnished, Packed, and sent Post-paid.

N. B.—The Chromo will be delivered: At the Office, Unmounted, Free.

" " Mounted, 15 cents extra.

Sent by Mail, Unmounted, 10 cents extra.

" " Mounted, 25 cents extra.

We advise all to have them mounted before leaving the office, as in the large quantities we put up we are able to mount them for a quarter of the cost of doing it singly, and better than it can usually be done elsewhere.

The picture is designed for every subscriber upon the terms stated above, which please read carefully; and on these terms all are alike entitled to it, whether their names come singly at \$1.50 each, or in Clubs of Four for \$5, or Clubs of Ten at \$1.20 each, or in Clubs of Twenty or more at \$1 each. Subscribers in Premium Clubs will also thus be entitled to it.

N. B.—A few of the beautiful pictures entitled "MISCHIEF BREWING," which have been given to so large a number of subscribers, are still in stock, and, while any remain, subscribers to the American Agriculturist can have their choice between this and the new Chromo "UP FOR REPAIRS"; but the choice must be named at time of subscribing.

ORANGE JUDD COMPANY, 245 BROADWAY, NEW YORK.

BEAUTIFYING

COUNTRY HOMES.

AN ELEGANT QUARTO VOLUME.

By J. WEIDENMANN

PRICE, POST-PAID, \$15.00.

This magnificent work is illustrated not only with numerous fine wood-engravings, but also with seventeen full-page and seven double-page colored lithographs of places already improved. It embodies the results of a long practice in landscape architecture and rural adornment, and while its teachings are in accordance with the received rules of art, they are thoroughly practical in their character. It is one of the most elegant, and ought to prove one of the most useful works ever issued in the country. The work, both in its letter-press and colored lithographs, is beautifully printed, and it is elegantly bound in beveled boards.

Hussey's National Cottage Architecture.

New and Original Designs, Working Scale Drawings, and Details for all Styles of low-priced Houses, with Specifications and Cost. Just published. Royal quarto. Post-paid, \$6.

WOODWARD'S NATIONAL ARCHITECT. 1,000 WORKING DRAWINGS, Plans, Details, Specifications, and Estimates. TWELVE DOLLARS, post-paid.

MONCKTON'S NATIONAL STAIRBUIDER. SIX DOLLARS, post-paid.

MONCKTON'S NATIONAL CARPENTER and JOINER. SIX DOLLARS, post-paid.

TRADE MARK. THE UNITED STATES OF AMERICA. TRADE MARK. THE UNITED STATES OF AMERICA. TRADE MARK. THE UNITED STATES OF AMERICA.

IMPORTANT TO INVENTORS. American Agriculturist PATENT DEPARTMENT

In compliance with the request of numerous inventors, we have organized a PATENT DEPARTMENT in connection with this office for the transaction of all business connected with

Securing Patents in the United States and foreign countries. The character for

Reliability which has been maintained by the AMERICAN AGRICULTURIST for more than thirty years will be carefully guarded in this as in other departments.

All Inventors desirous of procuring patents at moderate cost are invited to forward (express prepaid) a model of their invention, with a brief description of its working. The model should not exceed one cubic foot in dimension. Upon receipt of model an opinion as to patentability will be given free of charge.

Preliminary Examination at the Patent Office, to determine patentability, will be promptly made for a fee of \$5.

Litigation of Patents. The services of the best counsel have been secured to prosecute or protect before the U. S. Courts and the Patent Office the claims of those intrusting their business to this agency.

Specifications, drawings, engravings, models, and all other appliances furnished at moderate prices. In all dealings with this Department inventors may depend upon promptness, fidelity to their interests, and the best services which can be rendered by thorough experts. For full particulars, address

AMERICAN AGRICULTURIST PATENT DEPARTMENT, ORANGE JUDD COMPANY, 245 Broadway, New York.

JENNIE JUNE'S AMERICAN Cookery Book.

Containing upwards of twelve hundred choice and carefully tested recipes; embracing all the popular dishes, and the best results of modern science, reduced to a simple and practical form. Also, a chapter for invalids, for infants, one on Jewish cookery, and a variety of miscellaneous recipes of special value to house-keepers generally.

By Mrs. J. C. CROLY (Jennie June).

PRICE, POST-PAID, - - - \$1.75. Address ORANGE JUDD COMPANY, 245 BROADWAY, NEW YORK.

Address orders, specifying by its letter or number the frame desired, and inclosing price, as above, to the ORANGE JUDD COMPANY, 245 BROADWAY, NEW YORK.

Rich Farming Lands

For Sale VERY CHEAP by the
Union Pacific Railroad Co.

MILLIONS OF ACRES

IN THE

STATE OF NEBRASKA,

AT PRICES RANGING FROM

\$2.00 to \$10.00 per Acre.

Five and Ten Years' Credit Given,
with Interest at Six per Cent.

**Convenient to Markets East
and West.**

The Lands of the Union Pacific Railroad Company are the odd numbered Sections for twenty miles on each side of the road. They are located in the valley of the Platte and its tributaries—a region widely celebrated for its beautiful scenery, rich, productive soil, and mild and healthful climate. The winters are short, and the atmosphere dry and invigorating. Epidemic diseases are unknown. The surface is undulating, covered with nutritious grasses, and watered with numerous clear running streams. All the productions of the Eastern and Middle States are grown with success. Wheat and Corn are the staples, and it is well adapted to the cultivation of Fruit. For Stock-raising, in all its branches, these lands are unsurpassed. The Union Pacific and its branch railroads furnish Market Facilities unequalled. Education is free. One-eighteenth part of the entire area forms a permanent endowment of the Public Schools. Good Society, Schools, Churches, Post-Offices, Mills, Stores, and other advantages of civilization are enjoyed.

The liberal provisions made for Education, the freedom from State debt, the rapidity with which this section is settling, the numerous towns and villages springing up, offering inducements to the merchant and mechanic, render this tract a most desirable location for the industrious man of limited means to secure a comfortable home, and acquire competence, independence, and position.

These lands are granted directly to the Railroad Company. The title given to the purchaser is absolute, in fee simple, free from incumbrances. They are sold in tracts of forty acres and upwards, giving the man of small means an equal chance with the capitalist to make a safe and profitable investment, one which can not be destroyed by fire or flood, a provision for future support, not affected by *revisions*, or liable to the fluctuations of stocks.

Full information in reference to particular localities will be furnished, good lands selected, and sales made, free of charge, for persons not desiring to incur the expense of coming to examine the lands in person.

ALSO,

THE PIONEER,

NOW READY.

A New and Revised Edition of Peter Henderson's well-known Work, **Gardening for Profit.**

A Guide to the Successful Cultivation of the Market and Family Garden.

By **PETER HENDERSON.**

Finely Illustrated. Price, Post-paid, \$1.50.

The following voluntary notice of this work comes from a Western market gardener and shipper of vegetables, and is a specimen of similar testimony from very many quarters.

"March 23d, 1874.

"If this should go to Mr. Henderson, I would say that I believe the gardeners of this country would gladly hail another edition of 'Gardening for Profit,' at least, I thank him for that little work. Through its influence I left a paying manufacturing business and began to follow its teachings. This was three years ago. Now I have a market garden of thirty acres and 400 four feet sash, and enjoy myself as I never did before. Again I thank him."

Money IN THE GARDEN.

A VEGETABLE MANUAL,

PREPARED WITH A VIEW TO

ECONOMY AND PROFIT,

BY P. T. QUINN,

PRACTICAL HORTICULTURIST.

In this work the author aims to give, in a plain, practical style, instructions on three distinct although closely connected branches of gardening—the kitchen-garden, market-garden, and field culture; the only and sufficient credentials for the fitness of his undertaking being a successful practical experience for a term of years.

CONTENTS.

Chapter I. Money in the Garden.	Chapter VIII. Melons.
" II. Hot-beds.	" IX. Onions.
" III. Artichoke.	" X. Parsley.
" IV. Beans.	" XI. Radishes.
" V. Cabbages.	" XII. Salsify.
" VI. Egg-Plants.	" XIII. Tomatoes.
" VII. Lettuce.	" XIV. Forcing Houses.
Chapter XV. List of Seeds.

Herald of Health.

This monthly is devoted to the culture of the body and mind; to rearing healthy and beautiful children; to the recovery of health without drugs; to the improvement of the physique; and to showing people how to live so as to be healthy, happy, and make the most of life. The Scientific American says: "It contains more sensible articles than any monthly that comes to our sanctum." \$2.00 a year, with a premium of the complete works of Shakespeare, in one volume of over 1,000 pages and 36 illustrations.
WOOD & HOLBROOK, 13 and 15 Light St., New York.

ENGLISH CHANNEL LADIES careful of their feet always wear ENGLISH CHANNEL Shoes, and buy none other. A dark line around the sole near the edge shows where the channel is cut. No more ragged soles. Make your dealer get them for you.

INVENTORS Who wish to secure PATENTS should write to MUNN & CO., 37 Park Row, New York, for Advice and Pamphlet, 108 pages, FREE.

A New and Revised Edition of Peter Henderson's well-known Work, Gardening for Profit.

A Guide to the Successful Cultivation of the Market and Family Garden.
By PETER HENDERSON.
Finely Illustrated. Price, Post-paid, \$1.50.

The success of this book has probably not been equaled by that of any horticultural work of the present day. Its popularity is due to the fact that it tells just what people wish to know—the way in which the author made money by gardening—and puts in a plain, striking light all the requisites to success. The writer was not afraid to have people know that he cultivated his land for profit, and, more than that, he was quite willing that all should know and practice. If they chose, the very processes which he had found most conducive to the desired end. The late Horace Greeley said of this book: "There are marvels of transformation and rapid reproduction recorded therein, which might well shame the dull fancy of the author of Aladdin or of Kaloolah. There is no theory about it; a man who has made himself rich by market-gardening plainly tells our young men how they can get rich as easily as he did, and without wandering to California or Montana for it either." And tens of thousands who have read and profited by the work could give similar testimony. It is unquestionably the most thorough and the best book of its kind that has yet come from the hand of an American author. In the revised edition several new chapters will be found, and in the selection of varieties much has been changed, though the plan of the work is the same as before.

The following is a specimen of hundreds of letters that have been received concerning this work.

"I was an early purchaser of 'Gardening for Profit,' a reading of which made the possession of 'Practical Floriculture' a necessity. I sincerely thank the writer for giving us non-professionals what we have so long needed—some plain common-sense directions for our assistance—and for having exploded some outrageous humbugs which have been perpetuated in all previous works on gardening and floriculture from time immemorial, tending to produce the conviction that nothing but professional skill could raise a vegetable or flower. LUTHER NEWCOMB, Montpelier, Vt. May 4, 1873.

The following voluntary notice of this book comes from a Western market gardener and shipper of vegetables, and is a specimen of similar testimony from very many quarters.

"March 23d, 1874.
"If this should go to Mr. Henderson, I would say that I believe the gardeners of this country would gladly hail another edition of 'Gardening for Profit;' at least, I thank him for that little work. Through its influence I left a paying manufacturing business, and began to follow its teachings. This was three years ago. Now I have a market garden of thirty acres and 400 four-foot sash, and enjoy myself as I never did before. Again I thank him."

THE COMBAT.—*Drawn and Engraved for the American Agriculturist.*

No animal presents greater contrasts than does the male deer at different seasons. In winter, after his horns have fallen, and in spring, while waiting for them to grow again, the buck presents a very different appearance from the same animal in autumn, when, with wide-spread antlers, and courageous bearing,

he is ready to do battle with his rival. At this season the bucks roam the forest in search of the does, and when two meet, a battle is likely to ensue. In these contests the horns of the bucks become sometimes so interlocked, that it is impossible for the animals to disengage, and death by starvation must follow. In the wilds

of Texas, we have frequently met with pairs of skulls with the horns thus entangled. When we consider that the horns will be shed naturally in a few months, the strength with which they hold to the skull is astonishing. Even the horns of three animals have been found fastened together, with the skulls attached.

Milking Machines.—"J. E. S.," Richmond Co., N. C. There are various machines invented for drawing milk from the cow, but none are in use practically that we know or have heard of. There are two principles involved in these machines, one to open the duct by inserting a tube and allowing the milk to flow out by its own weight, and the other to draw the milk from the teat by a pump, or by creating a vacuum into which the milk flows. We see so many practical objections to the use of these machines, that we can hardly advise any one to waste time in trying them.

AMERICAN AGRICULTURIST.

NEW YORK, JULY, 1874.

July is a hot and busy month. We are in the midst of haying and harvesting, with corn, potatoes, beans, and roots to cultivate, hoe, and keep free from weeds. We have to think also of the next wheat crop, and not neglect our summer fallows. There are the cows, the sheep, the horses, the swine, and the poultry to be looked after. There is, perhaps, fruit to be picked and marketed. Altogether, the farmer has his hands full. He needs an active brain in an active body. If he has good health, the work should not discourage him. He will pull through. He should not get excited; he should not worry. He should keep cool; and the best way to do this, in more senses than one, is to keep steadily at work. Work will clear the mind and cool the body. But it should be energetic, spirited work, not slow, plodding drudgery. Every stroke should be directed by the mind and be given with a will. It is such work that tells. Few of us realize how much the character of farm work has changed. It is better to run a mowing machine than to swing a scythe all day, but there are men who are not happy unless they are engaged in some hard, steady work. They have not patience enough to manage a machine. They are mental sluggards. They want a machine to put itself together, to tighten its own bolts, to be self-sharpening and self-oiling. Such men are born hewers of wood and drawers of water. They will not make successful modern farmers. The farmer who has his mower, tedder, unloading-fork, self-raking, and self-binding reaper; who cuts feed, turns the grindstone, and pumps water by wind or horse power; who plants his corn with a drill, hoes it with a harrow, cultivates within an inch of the rows, cuts up the crop, and husks it with a machine, is a very different man from Hodge, the farmer, as he exists in the mind of the novelist or poet. We believe in farmers and in farming. There is not as much isolation on a good farm as in a large city. There is no lack of excitement or of mental stimulus. We have not time to be dull. The seasons are too short and the work too pressing. We are in a hurry to harvest our crop, that we may sow the next. We live in the future; and if we aim to improve our farms and our stock, we

can yearly see sufficient evidences of real progress to feed our hopes and encourage us to continue our labors. Farming is slow work, but we are building on a solid foundation, and are reasonably certain of our reward. Let us brace our minds with hope, and continue the good work. The prospects for good farmers in this country were never more encouraging than at the present time.

Hints about Work.

The Most Important Work on a farm is not plowing and sowing, haying or harvesting. These are big jobs that force themselves on our attention. They are rarely neglected.

Little Things, which we are apt to overlook and neglect, are the most important. We need to look more to the little rivets that fasten the sections on the cutter-bar of a reaper than to the main driving-wheel. Dipping lambs to kill ticks is more important than shearing the sheep, because more likely to be postponed and forgotten.

Farmers often Work too Hard.—Some of the most successful farmers we have ever known were men who kept others at work, but did little so-called work themselves. They knew how everything should be done, and saw that it was done promptly and well. They lent a hand when it was necessary, but took hold of no steady work that an ordinary laborer could perform.

Your own Health and that of your Family should be the first consideration. See that the cellar is clean, and the sink and out-houses are not giving off poisonous gases.

Dry Earth is a cheap disinfectant. Use it freely, and be not sparing of water, soap, and lime.

Personal Cleanliness would be less rare among hard-working men and boys if bathing conveniences were more common. A good swim is a good thing, but a man can be clean without having a river to bathe in. A tub of soft water, in the barn, if need be, with soap and sponge and towels, should not be lacking on any farm. We should think little of the man or boy who will not use them.

In Malarious Regions do not get up too early in a morning; and in our changeable climate no house should be without the means of making a fire at a moment's notice. If the evenings are damp or chilly, make a fire, if necessary for comfort, and keep the doors and windows open. Many people seem to think if they make a fire they must shut the doors.

Nutritious Food and plenty of it is essential to good health. A man who does not eat can not work. Meat soup is better than beer, and a cup of good coffee is more invigorating than a pitcher of hard cider. For a hard-working man, good bread and firm, fat pork, are better than cakes or cookies.

Work Lively.—It is less fatiguing to milk ten cows in an hour, than in an hour and a half, and you have the half hour to give them a little extra food, which is certainly good for the cows. Horses should rest in the pasture or the stable, and not when in harness. Heavy boots and slow motions belong to a species of farming which is fast becoming extinct. Do not carry one pail of water when you can carry two. Study the economy of labor. Do not waste your time or your energy. Make every stroke count, and let the strokes be given with a will.

Haying should be pushed forward rapidly. In our experience, it is not wise to wait for the weather. While the grass is green, a little rain or dew does not hurt it. We like to cut in the afternoon and evening, and let it lie all night. The next morning, when the dew is off, turn it or ted it with a machine. In the afternoon rake into windrows, and if timothy, draw it in; or if clover, put it in a cock and draw in as soon as ready—say the next afternoon, turning or opening the cocks in the meantime, if necessary. Clover makes capital hay if cut early and well-cured.

Wheat should be cut as soon as there is no milk in the kernels. If the field is square, and there are five men to bind, each man will have a side, and

they can go round and round the field after the reaper. A man will bind one side while the reaper cuts five sides. If the field is large and the crop heavy, a good reaper will give the five men all they want to do. See that the sheaves are of the proper size and well bound, and be careful that they are firmly stuck up in shocks that will shed rain.

If you Thrash as drawn from the field, the grain must be thoroughly dry and hard, and even then there is danger of the wheat heating if placed in a large heap. We nearly always thrash our own wheat as drawn from the field, but we are careful to turn the grain every two or three days, and spread it out as much as possible on the barn-floor.

Rake the stubble between the shocks immediately after the wheat is cut. If this is done in the evening, or in the morning while the dew is on, there will be less grain lost by shelling.

The Rakings, when you thrash from the field, should be loaded the night before and drawn to the machine. A good man, with nothing but sheaves to pitch, will send home the wheat as fast as a ten-horse power machine can thrash it. You require three wagons—one at the machine, one going back and forth, and one in the field.

Six-rowed Barley will be ripe about the same time as wheat, and you can cut it while the wheat is curing in the field; thrash both crops at one operation, and put the straw of both into one stack.

Two-rowed Barley is rarely ripe for some days after the wheat, and many prefer it on this account.

Tinding Barley into sheaves like wheat is the better plan, provided the crop is a heavy one.

Oats will not be ready to cut for ten days or two weeks after wheat, giving as a breathing spell. So far as the quality of the grain is concerned, oats are quite frequently injured by cutting too early. But where the straw is used for fodder, what we lose in the grain we gain in the straw.

Oats and Peas grown together, we cut with a Johnston reaper. The machine throws the crop off the platform into moderate sized heaps. These are turned once or twice, and then drawn to the barn and thrashed. If the weather is unsettled and the crop very green, it may be necessary to put it into cocks. If well cured, the straw is very nutritious, and is greedily eaten by sheep and horses.

Peas are sometimes pulled up with a rake. It is a slovenly practice. It injures the fodder and leaves a large percentage of the peas on the ground. True, these can be eaten by pigs and sheep. But at this season we have all the other stubbles for the stock to glean. It is better to "roll" the crop with a scythe, unless it can be cut with a reaper.

Cultivating Corn must, on no account, be neglected. The cultivators, with short whiffletrees attached, should be in the field and ready for use at a moment's notice. Then if a shower stops work in the hay or harvest field, or while the dew is on in the morning, start the cultivators, if it is only for an hour or two. The ground should never be allowed to crust over, and no weeds should be suffered to grow. We plant no pumpkins with our own corn, and cultivate frequently as late as the first week in August. "It is the last blow that kills the cat," and it is the last hoeing and cultivating that kills the weeds and leaves a clean corn stubble. Cultivate shallow—just deep enough to kill the weeds. If any thistles escape, cut them with a hoe.

Root Crops, such as beets, mangels, and rutabagas, must be kept thoroughly cultivated and hoed. Thin out the plants in the rows to twelve or fifteen inches apart.

Common Turnips, such as the Yellow Aberdeen, may be sown any time this month, and such varieties as the Strap-leaf may be sown as late as the first of August. Superphosphate of lime is the best of all manures for common turnips. It is far better to sow in rows wide enough apart to admit of the horse-hoe—say twenty-eight inches—than to sow broadcast.

Summer-fallows for Wheat must be repeatedly

stirred with the harrow and cultivator, and kept mellow and free from weeds.

Barley, Oat, or Pea Stubble, intended for wheat, should be harrowed or cultivated immediately after harvest, to start any seeds lying on or near the surface. Then plow carefully and well. Harrow and roll. Any weeds that start must be killed by the cultivator. Whether it is or is not best to plow again before sowing, depends on the character of the land and on the weather. On light land and in dry weather, we think it is not desirable to plow the second time. We want to retain as much moisture as possible in the soil, and one or two inches of loose, mellow surface soil, makes a capital mulch, and keeps the soil below moist and in good condition to start the wheat when the seed is deposited in it with a drill.

Weeds on Stubbles and in Pastures may be cut with a mowing machine, and if the seeds are ripe enough to grow, rake up the weeds with a wire horse-rake and burn them.

If you are Short of Grass, keep the horses in the stable or yard, and feed cut hay, shorts, and corn-meal. A large horse at hard work requires about sixteen pounds of hay and fifteen pounds of corn-meal per day. A bushel of cut hay weighs about eight pounds, and corn-meal about forty-five pounds per bushel. If you mix half a peck of corn-meal with a bushel of moistened cut hay, and a quart of shorts, you can let the horses have all of this mixture they will eat up clean three times a day. Let them have a little long hay in addition.

If Pasture is Abundant, turn the horses out at night. If they are at hard work, let them have all of the above mixture of hay and meal they will eat. They will probably eat but little, but they should have all they will eat. Make short nooning, and quit the earlier at night, so as to give the horses longer time in the pasture.

"Corn-Meal Soup" is an established institution on our own farm. We keep a half-barrel constantly full of water, with a little corn-meal soaking in it. The horses are allowed to drink all they wish. We let them drink the first thing in the morning, and again when taken to work. When brought home at noon, they are also allowed to drink before being put in the stalls, and again when taken out, and so at night. By standing a few hours, the chill is taken off the water, and allowing them to drink when brought in from work, does not seem to hurt them. If the meal gets sour, remove it and feed to the pigs.

Milk Cows must have access to pure water. If the pastures are poor, a feed of corn-fodder, cut a few hours before feeding, will be of great value, especially if the cows are fed enough meal to make the corn-fodder as nutritious as the best of grass.

Sheep should have their feet pared; and if there is any reason to apprehend foot-rot, dress their feet with any substance that will kill the virus. We use crude carbolic acid, mixed with an equal quantity of melted tallow, and put it on with a small brush, being careful to cover every part of the hoof, especially between the claws.

Dip the Lambs, to kill ticks, in a solution of carbolic soap or tobacco water. Repeat in two weeks. Towards the end of the month, dip the sheep also.

Swine should have access to water. With this, and a good pasture, breeding stock needs nothing more. Young pigs and store hogs, that are to be fattened this fall, should be fed liberally.

Salt seems necessary to the health of all farm animals. They will not eat too much, if they have access to it at all times. If they are allowed to go without salt for two or three weeks, they will then eat more than is good for them. For swine, we mix about two quarts of coal or wood ashes, one pint of salt, and half a pint of sulphur, and let the pigs eat all they will of it.

Work in the Horticultural Departments.

July should have been called the Month of Weeds. The larger share of the cultivator's ener-

gy, in whatever department, is expended in keeping down the plants that are not wanted. Those who claim that weeds are a great blessing, as they induce a frequent stirring of the soil, can now enjoy this blessing in the fullest abundance. Weeds, like fire, are easily controlled, if attacked while small, but when they get fairly established, it is often cheaper to plow up the crop, than to undertake to weed it.

Orchard and Nursery.

Where crops are planted between the trees, the surface should be kept clear of weeds, and the soil mellow and loose.

Pruning may be done this month. Aim to get a broad, open head, so that plenty of light and air can reach the fruit, to perfect it properly.

Budding may be performed as soon as the buds are well matured, and the bark of the stock loose enough to be raised easily.

Young Trees, in nursery rows, must be looked after. Keep clear of weeds. Be careful, in cultivating between the rows, not to injure the trees with the whiffletree. Use a short whiffletree, with the ends well covered with leather or woolen.

Seedlings ought to be shaded, and if very dry, water occasionally. Hand-weed when needed.

Grafts, set in the spring, will require looking after, as it often happens that the stock will throw out vigorous shoots, which will rob the graft of its nourishment. All such should be rubbed off as soon as they appear.

Thinning, if not already attended to, should not be longer delayed. The difference in the size and quality of the fruit, will pay for all the trouble, in the increased price.

Seeds.—Save seeds of forest trees and shrubs, as fast as ripe. Most kinds need to be preserved in sand, to prevent them from becoming too dry.

Fruit Garden.

There will be plenty of work in looking after the harvesting of the fruit, and destroying the weeds, which now grow rapidly.

Strawberries, in most localities, will be through with by this time. The mulch should be taken off, and a dressing of manure applied. If plants are needed for new beds, allow the runners to take root. The plants thus formed, may be set out in the coming fall, or the following spring.

Raspberries follow close upon strawberries, and will require picking daily. After the crop is gathered, cut out the old fruiting canes, and allow only three or four new canes to each stool; these should be tied to stakes, or trellises, so that they will not be broken by high winds.

Blackberries will often need to be tied up, owing to the large quantity of fruit they set. A heavy mulch will enable one to keep down the weeds, as it is often difficult to hoe among them. The young and vigorous canes for next year's fruiting must be tied up.

Grape-Vines.—Tie up the young shoots, and thin out the fruit on young vines. Pinch the laterals to one leaf, and as they again start, repeat the pinching. Keep a sharp look-out for beetles and caterpillars, which should be hand-picked. As soon as mildew appears, apply sulphur with a bellows.

Currants.—If the "worm" eats the leaves, dust with powdered white hellebore. When trained in tree form, the branches are liable to break down, unless supported.

Dwarf Trees need care in thinning the fruit. Preserve the proper shape of the tree, by removing all superfluous and pinching rampant branches.

Kitchen Garden.

Asparagus.—Do not cut too late. As soon as peas come to take its place, stop cutting, and give a good dressing of manure. Allow the tops to grow until fall, then cut and burn, to destroy the seeds, if they are not wanted for sowing.

Beans.—Plant a few rows for late snaps. Pinch Limas when they reach the top of the poles.

Beets.—Early varieties, sown this month, will grow rapidly, and make excellent roots for winter use. Use the thinnings for greens.

Cabbages and Cauliflowers for the late crops may now be transplanted from the seed-bed. Keep well hoed, and occasionally water with liquid manure, if convenient.

Celery.—Set for main crop in rows, three feet apart, and the plants six inches.

Carrots.—Hoe often, until the tops cover the ground so much as to prevent working.

Corn.—Plant the early sorts now, for late use, and for drying, if wanted. Keep the cultivator and hoe in motion among that already planted.

Egg-Plant.—See that these have plenty of manure, both liquid and solid. Do not allow the fruit to remain long in contact with the ground.

Herbs.—Transplant from the seed-bed, and keep well hoed.

Melons.—Pinch back the ends of the vines, so as to throw all the strength into the fruit already formed. Remove such fruit as will not ripen.

Onions will need hoeing frequently to keep down the weeds.

Peas.—It is of little use to plant peas at this season, as they are almost sure to mildew. If it is proposed to risk it, plant at least six inches deep.

Seeds.—As soon as they ripen, gather and store in a dry, airy place, where mice can not get at them. Save seeds of only the earliest and best-formed fruit, roots, etc.

Sweet-Potatoes.—Do not allow the vines to root; move them once a week, and keep free of weeds.

Squashes.—Hand-pick the squash-bug; this is the only effectual remedy. Allow the vines to strike root at the joints.

Tomatoes should be trained upon trellises of some kind, to keep the fruit from contact with the soil. Brush or hay is better than nothing, and should be used if nothing else is at hand.

Weeds are to be fought persistently, and, if possible, keep the horse and cultivator in motion among the larger crops; it will do no harm if done every day.

There will be much clearing up of odd corners, and of ground already cropped to be done, and advantage must be taken of this time of comparative leisure to attend to it.

Flower Garden and Lawn.

Lawns require frequent cutting to keep the grass looking fresh and velvety; this will also kill annual weeds. Perennial weeds must be taken out when young, with a spud.

Climbers.—Keep neatly disposed upon the trellises, and provide supports for all such as need them.

Lilies.—Tie to stakes as soon as they become tall enough to need it.

Gladioluses will need stakes to prevent their flower-stalks being broken. Most seedsmen and florists now keep neatly turned sticks, which answer very well for this.

Annuals.—Quick growing sorts may be sown now for late flowering.

Perennials.—Keep the ground carefully weeded. Sow seeds as fast as they ripen; most kinds will make plants strong enough to winter safely, and bloom next year. Some will remain dormant until spring.

Dahlias require some support for their flower-stalks. Remove all imperfect flower-buds as soon as they appear.

Sub-Tropical Plants, where grouped upon the lawn, need considerable care to keep them in a flourishing condition. Remove defaced leaves, and stake such as require it.

Foliage Plants.—Where beds of Coleus, and other so-called "foliage" plants are used, they should be cut back, so as to form compact, bushy plants.

Greenhouse and Window Plants.

It will be difficult to keep the plants in the greenhouse and windows looking well at this season, unless considerable care is used. Plants should not be subjected to hot, drying winds, as these will soon destroy them. Shading of some kind is needed during the summer months, otherwise the leaves will become scorched. Admit plenty of air through the ventilators every day, and during warm nights they need not be closed.

Commercial Matters—Market Prices.

Gold has been up to 113 3/4 and down to 110 1/2—closing June 12th at 111 as against 112 1/2 on May 12th. Receipts of Produce have been quite liberal since our last, and prices of Breadstuffs have been generally quoted lower, leading to an active business, in good part for export; the decline in ocean freights helping the outward movement. Corn has been exceptionally scarce toward the close, and prime samples having been greatly needed for prompt shipment, values have been quoted stronger. Provisions have been fairly active, but at irregular quotations, closing generally in favor of buyers. Wool has been in fair demand, and held with more firmness, on very moderate offerings of desirable grade. New Clip, especially California, is in better supply, but held above the views of purchasers, in most instances, checking operations. Manufacturers are the chief buyers. Tobacco is quiet, at rather easier figures. Hops, Seeds, and Hay are selling slowly, closing barely steady. Cotton is in brisk demand, mainly for forward delivery, on speculative account, at variable prices, closing somewhat more firmly. In most other lines, trade is slow.

CURRENT WHOLESALE PRICES.

Table with columns for various commodities (Wheat, Corn, Rye, Barley, Oats, Flour, etc.) and their prices for May 12 and June 12. Includes sub-sections for Gold, Flour, Wheat, Corn, Rye, Barley, Oats, and various oils and beans.

The following condensed, comprehensive tables, carefully prepared specially for the American Agriculturist, from our daily record during the year, show at a glance

the transactions for the month ending June 13th, 1874, and for the corresponding month last year:

Table showing transactions at the New York Markets for Receipts and Sales of Flour, Wheat, Corn, Rye, Barley, and Oats for 1874 and 1873.

Stock of grain in store at New York.

Table showing the stock of grain in store at New York for Wheat, Corn, Rye, Barley, Oats, and Mall, with bush and barrel measurements.

Exports from New York, Jan. 1 to June 11:

Table showing exports from New York for Flour, Wheat, Corn, Rye, Barley, Oats, and Peas, with bush and barrel measurements.

Receipts at head of tide-water at Albany each season to June 30th.

Table showing receipts at head of tide-water at Albany for Flour, Wheat, Corn, Rye, Barley, Oats, and Peas, with bush and barrel measurements.

New York Live-Stock Markets.

RECEIPTS.

Table showing week ending receipts for Beef Cattle, Sheep, Swine, and other livestock.

Average per Week. Beef Cattle, Sheep, Swine. Do. do. last Month. Do. do. prev's Month.

Beef Cattle.—The unprofitable business at the close of last month left dealers heavy losers.

The natural consequence was the diversion of 70 car-loads of stock to other markets, and a falling off of 2,000 head in the receipts during the first week of the present month, as reported above. This gave a firm tone to the market, and a recovery of all that had been lost the previous week. The improved tone gained strength the next week, and the extra quality of the offerings helped the market to make another advance of 1/2c. This improved feeling has marked the whole of the month's business, and a steady market throughout, with a constantly advancing value of the better grades, and a fairly active demand for inferior grades has been the result. At the close of our report the feeling is somewhat easier, and inferior Texans are decidedly weak, although the market was cleared early in the day of all supplies. Texans sold at 8 1/2 @ 12c. # D., to dress 56 to 57 lbs. per cwt.; common to prime native steers brought 11 1/2c. @ 12 1/2c., and selections to dress 58 to 59 lbs. # gross cwt. realized easily 12 1/2c. @ 13c. # D.

The prices for the past five weeks were as follows:

Table showing week ending prices for Beef Cattle, Sheep, and Swine.

Milk Cows.—Dealers have met a brisk demand for good cows, and comparatively scant supply has kept the price for extra up to \$90 per head, calf included.

Common fair to good cows are selling at \$50 to \$75 each. Calves.—The market for veals has been irregular, and closes with a downward tendency. Buyers are holding off, and business is dull, at 4 1/2c. @ 6 1/2c. # D. for common to good State veals. Veals averaging 135 lbs. sold at 6c. # D. Sheep and Lambs.—The business in sheep is reported as having been a losing one, and early in the past month sheep sold at a loss of \$100 per car-load to the owners. Slaughterers also complain of an unprofitable trade, and the market closes without any recovery. Sheared sheep are dull, at 5 1/2c. @ 7c. # D. Lambs are also weak and declining, the last sales at 8c. @ 11c. # D. Swine.—The market for live hogs has been without business, all arrivals being consigned direct to the slaughterers. Dressed hogs have been easy throughout the month, with a gradual decline from extreme rates of last month to 7c. @ 7 1/2c. # D. The bulk of the business at the close was done at 7 1/2c. # D., with a tendency toward lower prices.

**SPECIAL PREMIUMS
STILL OFFERED.**

MULNUM IN PARVO KNIFE, OPEN—WEIGHT 2 OZ.

The General Premium List closed July 1st. The following Special Premiums are continued until further notice:

The Multum in Parvo Knife for 8 subscribers to *American Agriculturist* at \$1.50 each a year. (Knife sent post-paid.)

The Beckwith Improved \$12 Sewing-Machine for 10 subscribers to *American Agriculturist* at \$1.50 each a year.

The Beckwith Portable Family Sewing-Machine, price \$20, for 30 subscribers to *American Agriculturist* at \$1.50 each a year.

BECKWITH PORTABLE \$20 SEWING-MACHINE.

To secure the Chromo, mounted and prepaid, 25 cents must be remitted with each subscription for *American Agriculturist*.

N. B.—Two half-year subscribers in all the above cases may count for one full year in a Premium Club List.

Concerning the Advertisements,

We have a few words to say to our READERS: We mean to exclude everything which we think may be injurious or useless to the readers of this journal. We shut out all advertisements of patent and secret medicines, because we don't believe people ought to buy or use them. It is a pretty severe sacrifice to do this, because the medicine makers get from sick and nervous people dollars for what costs them half-dimes, and they can, and do, pay publishers largely for space in which to work upon the fears and hopes of the people. We also

ask advertisers of good things, when they are not known to the editors personally, or by good repute, to furnish satisfactory evidence that they have both the *ability* and the *intention* to do what they promise to do in their advertisements, and if we are not well enough satisfied on this point, they are excluded. Our strict rules annually shut out a hundred thousand dollars of advertising, which is admitted into most newspapers. Sometimes, with all the care we can exercise, an objectionable advertisement gets in, but on our attention being called to it, we stop it. There have been one or two books, for example, admitted, which, though proper enough to be read by parents or adults of good judgment, we do not wish to bring to the notice of children or young people of prurient imagination. We shall try not to err even in this respect again. And now, after this explanation, we ask our readers to always look over and through the advertising pages. They will get many suggestive hints about business, by so doing. And further, as our advertisers are generally a good and reliable class of persons, and are in a good place, among good company, we like to have them know that they reach, through this journal, a good class of readers—we think the best class in the world. So when our readers send inquiries, or orders, or for circulars, to our advertisers, they will confer a favor upon them and upon us by mentioning the fact that the advertisement was seen in the *American Agriculturist*. (We may hint, privately, that this may be useful to the readers, for our advertisers generally know that if there is a "black sheep" among them who does not deal honestly by our readers, he will thereafter be liable to exclusion from these columns, if he does not also "catch it" by an editorial notice, that will not be of the most pleasing character.)

Please tell your Friends

THAT THEY CAN SECURE THE
AMERICAN AGRICULTURIST

Six Months for only 75 Cts.

In order to enable many persons to become acquainted with this valuable Journal, who have not hitherto taken it, the Publishers will receive subscriptions for it for the months commencing with July and ending with December, 1874, at seventy-five cents each. Will not each of our present subscribers speak "a good word" to friend or neighbor?—Please note: We will send the *American Agriculturist* for six months, beginning with July, 1874, for seventy-five cents. This offer, of course, does not include the beautiful chromo "Up for Repairs," which is offered to all *yearly* subscribers free, when taken at 245 Broadway, or twenty-five cents extra when sent prepaid. Give the paper a six month's trial trip, or better still, try it a year.

... P. S. ...

Better Still!
BEAUTIFUL \$5 CHROMO,
AND
Half a Year's Subscription,
ALL
For a Single Dollar.

Considering the hardness of the times, and in order to meet the wishes of a great number who desire to have our beautiful chromo, "UP FOR REPAIRS," but who did not feel able to pay the \$1.75 required to get it, the Publishers have just decided to send the *American Agriculturist*, from July 1st to the end of the year, and to deliver, free of postage, a mounted copy of this beautiful **Chromo**, which has given so much pleasure, all for \$1, if promptly called for.

Please make this known to all your friends and neighbors.

containing a great variety of items, including many good hints and suggestions which we throw into smaller type and condensed form, for want of space elsewhere.

Remitting Money: — Checks on New York City Banks or Bankers are best for large sums; make payable to the order of **Orange Judd Company. Post-Office Money Orders** for \$50 or less, are cheap and safe also. When these are not obtainable, register letters, affixing stamps for postage and registry; put in the money and seal the letter in the presence of the postmaster, and take his receipt for it. Money sent in the above three methods is safe against loss.

Postage: On American Agriculturist, 12 cents a year in advance. Double rates if not paid in advance at the office where the papers are received. For subscribers in British America, the postage, as above, must be sent to this office, with the subscription, for prepayment here. Also 12 cents for delivery of *American Agriculturist* in New York City.

Bound Copies of Volume Thirty-two are now ready. Price, \$2, at our office; or \$2.50 each, if sent by mail. Any of the last seventeen volumes (16 to 32) will also be forwarded at same price. Sets of numbers sent to our office will be neatly bound in our regular style, at 75 cents per vol. (50 cents extra, if returned by mail.) Missing numbers supplied at 12 cents each.

Our Western Office.—Our friends in the West are reminded that we have an office at Lakeside Building, Chicago, Ill., in charge of Mr. W. H. Busbey. Subscriptions to *American Agriculturist* are taken there, and sample copies of the paper and chromo are delivered, and orders received for advertising on the same terms as in New York. All our books are on sale at the Western Office. Please call and examine, buy, subscribe, and advertise.

Sale of Hearth and Home.—During four years past, the Publishers of this Journal have also issued the weekly HEARTH AND HOME. Mr. Judd has been absent in Europe for a year, and experienced so great benefit in the improvement of his health, that he desires to be more at liberty in the future to devote himself to the *American Agriculturist*. The Publishers have therefore deemed it expedient to be relieved of the care and labor of a weekly journal, and HEARTH AND HOME has been sold to the Publishers of the Graphic Company, of 39 and 41 Park Place, who will hereafter issue it with illustrations by the new photographic process. And now, with the well-known and well-tried corps of Editors at their posts, and with the attention of all concentrated upon this Journal, the Publishers are confident that their old favorite, the *American Agriculturist*, will be more than ever worthy a place in every home.

Other Basket Items on page 273.

SUNDRY HUMBUGS.—It seems necessary to remind our friends, from time to time, that this column is not the place in which individual grievances can be set forth. We take quite as much care to avoid doing injustice to innocent parties, as to do justice to those fraudulent persons, who deserve the distinction of a place among humbugs. Men, on the average, are suspicious, and if mistakes occur in their dealings with persons at a distance, they at once conclude they have been defrauded. There is no business in which dissatisfaction is more likely to occur, than in that of seedsmen. Probably not one person in ten can sow seeds properly, yet all failures, from whatever cause, are set down to dishonesty on the part of the seedsmen. There is hardly one of our seedsmen, even those of the highest reputation, of whom we have not had complaints, accompanied with a request to put him among the humbugs. Upon investigating such cases, we have found that the fault was generally on the part of the complainant, and the dealer ready to make ample reparation, whenever the fault has been his own. In fact, no dealer in seeds, or other matters, in which a good reputation is all important, can afford to put it upon no higher ground—to be dishonest. A seedsman, florist, or nurseryman, who gets a reputation for inaccuracy or unfairness, might as well shut up shop. The same remark will apply to dealers in live-stock of all kinds, from bees to Shorthorns. That Pennsylvania live-stock concern, of whom we have had so many complaints, would have been shut up long

ago, had any of the swindled parties one particle of spunk. Each of the many persons who has come to us with complaints, appears to have a good case, but instead of bringing the rascals into court, they write to us, and ask us to expose the concern, and not give their names. We are not in the catspaw business; and while, when convinced that systematic fraud is being practised, we are willing to take the risk of exposing it, we can not take up cases for which there is a ready remedy. The clergyman in Missouri, who thinks he has been defrauded in a hee transaction, a correspondent in New York, whose ducks' eggs did not hatch, and the one in Massachusetts, who is in trouble about his pigs, will see that we can not show up certain dealers as humbugs, upon their simple accusation, and without having available witnesses and facts to justify us before a jury, if need be.

HORTICULTURAL HUMBUGS

have been so frequently exposed in our columns, that we supposed no reader of the *Agriculturist* could be taken in by those French scoundrels, who appear each spring in our principal cities, sometimes as Lafayette & Co., and in other years under other names. These chaps have catalogues so similar, and pictures of their wonderful products so alike, that they are probably all parts of one great swindling concern. "Greenhorn" sends us one of these French-English catalogues, with the things marked which he has purchased, and asks if he has been "sold." Now, friend "Greenhorn," you have marked on this catalogue, "Mezel Cherry, cleveu in one pound;" Pear, "Moastrous of Africa, heavy, four pounds;" "Prince's Plum, without stone," and other equally absurd things. If you do not know that "Tree Strawberries," with fruit weighing a pound; that apricots, weighing a pound each; that raspberries, with "large fruit as a egg of a fowl," are barefaced frauds, you have taken a very sure, but very expensive way of learning. Know, O "Greenhorn," that our nurserymen are as wide-awake as any other dealers; and if there were upon the face of the earth, any such trees or plants as are given in the catalogue you sent us, they would have them, if they had to send to the most remote countries. New York City is a great field for these impostors. Gentlemen who have country places, and who would, by no means, pay a skilled gardener bricklayer's wages, will spend their money freely upon these novelties, because they are "French," and their claims are set forth with blushing impudence and lying. We confess to feeling very little compassion for those who throw their money away in this manner. . . . A New Yorker, who does not give his name, offers "Two of the greatest medicinal and sweet-scented plants in the world," "presented for the first time to the American public." One is *Nigella sativa*, (intended for *sativa*), "makes one of the greatest tonic medicines in the world." If the friend who sent us the circular, knows of any old grandmother's garden, where the plants of fifty years ago are yet undisturbed, he will find this wonderful *Nigella*, grown under the name of "Nutmeg flower." Its only novelty consists in its antiquity; its seeds are aromatic, and were formerly used as a spice. The other plant is *Phyllanthium aquaticum*, which should be spelled *Thellandrium*, and is now known as *Eranthis*. This, it is said, "is used for bronchitis, consumption, and obstinate ulcers." Now, we advise all afflicted with either of these troubles, not to dose themselves at all, but especially not with this "*Phyllanthium*," as it is a dangerous narcotic poison, and like related plants needs to be used with great caution. While we have no reason to doubt that the advertiser will furnish the plants upon the terms he proposes, they are offered under incorrect, and no doubt, mistaken ideas of their value; and so far as this goes, they are horticultural humbugs.

THE NON-EXPLOSIVE POWDER MAN

has been in Troy, and one Trojan speaks his mind on the subject. If any ladies take offence at what is said, they must remember that the remarks are not ours, but those of our irate correspondent. He, in substance, says: "I take your paper, and am pretty well posted as to the leeches of humbugs, but my wife, confiding as women generally are, has been duped by one of them. An 'Agent' called at my house, with some powder to render kerosene oil non-explosive, and nothing would do but he must try some of it, to convince my wife of its qualities. He put some of it into a Perkins & House's safety lamp, and it has succeeded splendidly! It rendered both the oil and the lamp non-explosive, as it stopped up the tube which supplies oil to the wick, and of course rendered the lamp perfectly useless. I am not in the habit of using strong language, but if ever that agent comes within range of a 'Springfield' that I brought home from the war, I will try some powder that will not be 'non-explosive.'" Our advice to the Trojan friend is, to say nothing, buy a new lamp, and set the other aside, as a sort of beacon, to point out shoals and dangerous places. The wife has had her les-

son, and has not paid half so dearly for it, as she would had she bought some quack medicine. It might be worse.

CHEAP AND WORTHLESS SEWING-MACHINES

are still complained of by those who are victimized by the vendors. Some complain, that they saw advertisements of these things in a horticultural paper; such would do well to present their grievances to the paper, through whose agency they were induced to invest. We can not help those who have sent money, and receive nothing in return. It would require the whole time of one man to investigate all the various complaints, and amount to nothing. The best way is, to regard the amount lost, as so much paid for instruction, and if it teaches caution in future, it may not be a bad investment. . . . Cheap Carpets. "J. L. H.," Kansas. We know nothing of the concern you inquire about, but if you succeed in getting good carpets at 37½ cents a yard, we hope you will let us know, as we would like some too.

A GRAND "PRIZE CONCERT;"

this time it is in Texas, and it does not pretend to be for any State library, children's home, or use any other charitable cloak to cover its sin. It is a prize concert for the benefit of the manager, and so far is above-board, but the circular accompanying the tickets, which are sent out freely to people in the Western States, says: "Should your State laws prohibit the sale of 'Prize Concert tickets,' (remember that they are concert tickets, and not lottery tickets,) you can then advertise for applications for tickets." If any one thinks he can get around the law by following this advice, he would soon discover his mistake in any law-abiding community. . . . That Kentucky Library lottery advertises one more final distribution, but it will no doubt keep at it so long as a dollar is to be made.

MEDICAL HUMBUGS.

There is one thing, that we have repeated again and again, and yet it does not seem possible to make it generally understood. It is, that it is perfectly useless to send to us for our opinion of any "doctors," who advertise cures, or advertise their medicines—no matter in what papers they advertise, or where they live, or how many distinguished names they may have appended to their "certificates." We hold them all to be unsafe, and to be avoided. Notwithstanding we have given this notice so many times, scarcely a day passes, but the mails bring us letters, asking about these advertising doctors. We have no acquaintance with any of these chaps, and we advise every one to let them alone; we make no exceptions whatever. Some are out-and-out swindlers, others are ignorant pretenders, without any knowledge of medicine whatever, and if, by chance, there is one among them, who has a right to the title of M. D., the very fact of his advertising his claims, and vaunting the cures he has performed, shows that he could not make himself a position in the medical profession, and has gone into quackery to make money. . . . Clark Johnson, M. D., Jersey City, turns up again, in the form of a letter to an agent in Texas, in which he says of the exposures in the "*Agriculturist*," "particularly do we ignore them since we know the cause to be jealousy of our unprecedented success."—This is pretty good for a man who does not exist. If there only was such a person, as Clark Johnson, M. D., what a fellow he would be! . . . A most pernicious little pamphlet bears the title of "Medical Good Sense," and claims to be published by the "Manhattan Medical Institute." This sets forth a delicate disease, which no one would care to have, in an alarming light, and then gives "an infallible test," by which those who had their fears excited by the description, may themselves tell, whether they have the disease or not. The test is, to put some urine in a pint-bottle, and set it in a cool place, and if at the end of three days and nights there is cloudiness or sediment, there is "unmistakable evidence" of a serious derangement, and, of course, the only safe thing to do, is to send some of the sediment to the author of this pamphlet for microscopic examination. Now, every one who knows anything about such matters, is aware, that cloudiness in the urine, after standing in a cool place, is a very likely thing to happen, and it is not an "infallible test" for anything. It is just a dodge of this humbug, to frighten people into coming to him for treatment. . . . There is a rascally Dr. " & Co.," in Dalton, Ga., who is using the U. S. mails for a nefarious purpose. The proper officers down that way should put a stopper on him or them. . . . The medical humbugs are not a cheerful lot generally, but once in a while a bit of drollery turns up among them. A friend sends us an advertisement from a daily paper, which reads:

"TO CAPITALISTS.—DURING THE MEXICAN WAR of 1846 I was attached to the Army of the United States, and while there in 1847, obtained a very valuable medical recipe for purifying the blood, etc., of an aged Aztec Indian woman. I have not the means to bring it before the public. There is a fortune in it."

If any capitalist wishes to make a "fortune" by "purifying the blood, etc., of an aged Aztec Indian woman," we will give him the advertiser's address.

B. K. Bliss & Sons' Removal.—This seed establishment is on the move to 34 Barelay st. Cause, want of sufficient room in the old locality for the rapidly increasing business.

The Patrons of Husbandry have at last met with the only thing needed for their complete success—persecution. However swimmingly they have gone on upon their own merits, having now been thoroughly maligned, and held up as something to be avoided, they will prosper with unprecedented vigor. An Anti-Secret Society held a meeting a few weeks ago at Syracuse, N. Y., at which a new political party was proposed, and at which Mr. Chas. W. Green "went for" the Patrons and the Granges in the most absurd style. For the good he has done their cause, the Patrons should pension Chas. W. for life. In our view of the matter the officers and members of the order make a mistake in replying to him. Let him go on and advertise them.

Delaware Peaches.—Last month we gave a very favorable report of the prospects of the peach crop, since then an unfavorable change has taken place, much of the young fruit having fallen. If we accept the statements of the local papers, the estimate of 2,500,000 baskets, has dwindled down to about 100,000.

Hibberd's Horticultural Works.—Messrs. Groombridge & Sons, London, send copies of "The Amateurs' Flower Garden," "The Amateurs' Greenhouse and Conservatory," "The Fern Garden," "The Amateurs' Rose Book" and "Field Flowers," all by Shirley Hibberd, a horticultural author who is well known for his vigorous style and practical skill. These works are issued in a handsome form and finely illustrated, and are decidedly popular in England. They will be useful to such American amateurs as have sufficient horticultural knowledge to enable them to adapt their directions to the peculiarities of our climate. The same house publishes "The Floral World and Garden Guide," an illustrated monthly edited by Mr. Hibberd. The year's numbers of this make a fine volume.

Sale of Thorough Bred Horses.—The sale of horses from the studs of August Belmont, Esq., and Messrs. Hunter & Travis, took place at the Nursery, near Babylon, L. I., on June 11. There was a large attendance and the prices realized were fair on the whole. Several of the animals, however, were withdrawn for want of bids equal to their estimated value.

Valuable Reports.—Just as we go to press, there come to hand two reports too valuable to be disposed of in a hurried note: The Proceedings of the American Promological Society for 1873, and the Sixth Annual Report, by C. V. Riley, on the Noxious and Beneficial Insects of Missouri. These will receive attention another month.

Steam on the Canals.—The Baxter steam canal-boat has been awarded a premium of \$35,000 by the Legislature of New York, on condition that six of the boats be put into service forthwith. A company has been organized, with a capital of a million dollars, to build and run twenty of these boats this season. The reduction in the cost of transporting grain between Buffalo and New York, by these boats, is about three-fourths of the former rates. Now we need enlarged canals.

Shipping Dressed Meats.—The Texas and Atlantic Refrigerator Company have now one hundred cars engaged in transporting dressed beef from Texas to Eastern cities. One hundred beeves are slaughtered daily at Dennison, Texas, and the number will soon be increased to five hundred.

The English "Lock-out."—The "lock-out" of English farm laborers still continues. This is really a strike upon the part of the farmers, who are the employers of the laborers, the desired effect of which is to destroy the agricultural laborers' union. The need for laborers is pressing, and Belgian immigrants are being introduced, to take the place of the union laborers. The introduction of Chinese laborers into England has even been suggested. It is difficult to realize the altered condition of things in England, as evinced by these occurrences.

The Tobacco Leaf.—"J. W. H.," Hartford, Ct. The "Tobacco Leaf" is a weekly journal, devoted wholly to the tobacco interest, and will be found to contain a large amount of special information, of value to tobacco growers. It is published at 142 Fulton street, New York, for \$4 a year.

See Page 273 for other Basket Items.

"Songs of Grace and Glory," is the title of a new music and hymn-book for Sunday-schools, published by Horace Waters & Son, New York. Price 35 cents. We rarely see such good mechanical execution in so cheap a work, while the hymns and music are of a better class than are found in many of the music-books for Sunday-schools.

Farmers' Conventions.—The Farmers' Reform Convention of Indiana met at Indianapolis, and the State Farmers' Convention of Illinois was held at Springfield, both on the same date, June 10th. Both bodies set forth a "platform," and nominated a ticket for State officers. In neither State is the governor to be elected this year, and the contest will be over the other officers. As these are the first general elections in which a distinctly farmers' party has taken part, the results will be watched with interest by both the friends and the enemies of the movement. The platform or enunciation of principles in each State such as much commend itself to all who are not professional politicians. For ourselves, we rejoice at anything which awakens farmers to the fact that it is their duty to take a part in public affairs, and that it is a neglect of this duty which has allowed State matters to be mismanaged.

Holding On.—California farmers are now shipping their wheat direct to Liverpool, rather than sell at the current rate in San Francisco, which is about \$1.85 per 100 lbs. Some time ago, the same wheat could have been sold at \$2.35 per 100 lbs. An offer of 1,200 tons of choice wheat, to be delivered in July, at \$1.65 per 100 lbs., was recently made and refused.

Buckwheat for Cows.—"W. L. C.," Montgomery Co., Ohio. Our own experience with buckwheat for dairy cows is unfavorable, at least so far as regards the quality of the butter. It is true that it increases the flow of milk, but the butter yielded is white, and of poor, greasy flavor. As to the increased quantity, that has probably been shown as well, by some experiments made at the farm of the Eastern Pennsylvania Agricultural Society, in January last. In a week's feeding, when wheat bran was added to the feed, sixteen cows produced 1,252 lbs. of milk, yielding 117 lbs. of cream, and 57% lbs. of butter. The next week an equal quantity of buckwheat bran was substituted for the wheat bran, and the cows produced 1,262½ lbs. of milk, yielding 121 lbs. of cream and 59% lbs. of butter. During the last week the cold was much greater than the previous one, which would show a still greater value for the buckwheat. Nothing is said, however, as to the quality of the product.

Crop for Green Manure.—"A. W. H.," Clinton Co., Pa. It is too late now to sow any crop for green manures, except buckwheat. This may be sown up to the latter part of this month. We would sow at least a bushel of seed per acre.

Time to Market Hogs.—"M.," Warren Co., Iowa. The best time to market a hog is when he has made the largest growth upon the least feed. For early spring pigs this is generally in the next winter. At eight or nine months a good hog well kept from its birth, might weigh from 300 to 400 pounds, according to circumstances. If such a hog is kept over the winter, and well fed all the time for another year, its extra growth will hardly pay for the feed, and it will be too heavy for packers' use. In winter-time there is less growth for the same amount of feed than at any other season, therefore the objects should be to have the pigs come early, feed them well, and kill as soon as desirable in the early winter.

Poultry for Eggs.—H. B. Lasher, Ulster Co., N. Y., writes that he is now managing a henry for the production of eggs and fowls for market. He has 800 layers. We shall be glad to hear how our correspondent succeeds.

Corn Shelled or in the Ear.—"F.," Madora, Iowa. There is always more or less waste in feeding dry corn either in the ear or shelled. We have fed corn in the cob with the least waste, when it has been put into a barrel the day before it was to be fed, and scalded with boiling water, leaving it to soak until fed. This plan has been about as cheap as grinding the corn and feeding raw meal.

Sow-Bugs—Wood-Lice.—A gentleman from Westchester County, N. Y., came to us with specimens of a depredator, which makes serious trouble in his garden by attacking Asters, Amaranths, and other annuals, it being especially fond of Mignonette. The culprit proved to be what is, in this country, popularly known as "sow-bug." It is not an insect, but a crustacean, and more nearly related to the crab and lobster

than to a "bug" of any kind. It is a species of *Oniscus*, usually found under boards and stones, in damp places, and though we have heard of its being troublesome in greenhouses, we never knew it to be annoying in the open border. *Oniscus asellus*, the wood-louse of England, is a pest in greenhouses there, especially to orchids. The gardeners in that country rely mainly upon trapping: the animals have a desire to secrete themselves in crevices, and traps are made by stuffing flower-pots full of hay, placing two boards together with a small stick, to separate them, so as to leave a hiding-place, or by cutting a potato in half, scraping out a portion of the interior, and placing it cut-side down upon places they frequent. If any of our readers have had any experience with this crustacean, we hope they will give it for the general good.

Sal-Soda for Manure.—"J. M. A.," Huntingdon Co., Pa. Sal-soda, or crude carbonate of soda of the shops, is of no value as a fertilizer. Common salt, which is chloride of sodium (sodium in the metal, the oxide of which is soda), is a far better means of supplying soda to the soil, and is frequently of great value. We have greatly added to the yield of clover and wheat by the use of a bushel of salt per acre, but never knew or heard of any benefit accruing from the use of sal-soda.

Poland China Hogs.—"A. G. F.," Warren Co., Iowa. The Poland China, or Magic hogs, can hardly be called thoroughbred yet, but, notwithstanding this, they are an excellent race of hogs where large size is wanted, and probably as good as any for general use where corn is cheap and heavy pork is saleable. They can be procured of any of the breeders whose names are found in our advertising columns.

"Split Hoofs."—"A. G. F.," Warren Co., Iowa. Sand crack or "a split hoof" is very difficult of cure, without entire rest until new horn grows from the coronet or upper part of the hoof. But light work may be done if any blacksmith can be got who can put a bar-shoe upon the foot. When this shoe is put on, the crack should be cleaned of all dirt or sand, and the edges pared evenly. At the upper end of the crack a hot iron should be drawn across the horn in the shape of a Y, or a cut should be made with a sharp knife partly through the horn in that shape, so as to separate the entire horn from that which is cracked. The nail upon each side of the crack at the bottom of the foot should not be clenched until some strong, fine wire is wound in figure 8 form around them. They should then be clenched so as to retain the wire in place. When a new shoe is put on, the same should be repeated, bar-shoe as well, until the crack grows out altogether.

Sheep Nets.—"W. Y.," Wytheville, W. Va. The nets used in hurdling sheep are made in England. We have not the facilities here for making them cheaply enough. Mr. William Adamson, Gainesville, Pr. William Co., Va., writes us that he has imported some for his own use, and will furnish them to those who want them.

Manure for Clay Soil.—"E. W. C.," After barn-yard manure, the best fertilizer for a clay soil is probably lime, with clover plowed under after it.

Butter from Sweet Cream.—"H. B. O.," Whitinsville, Mass. The butter referred to in the extract sent, and also at page 238 of "Flint's Dairy Farming," would not be marketable butter by any means, nor will it retain its flavor long. It is in fact a sort of sweet cream cheese, white, of delicate but not true butter flavor, and is not really butter. When we speak of butter, we refer to the article known and sold as butter in the markets and in daily use, and we know of no method of making this without some mechanical process of agitation as in churning.

Thorough-Pin.—"J. B. D.," Union Co., Ohio. The weak points in the large, heavy Norman horses are the feet and legs. They are specially subject to thorough-pin and other like troubles, and if they are cured, the difficulty generally returns as soon as they go to work again. The proper treatment, however, is to let the horse rest, take off the shoes, and let the feet rest upon soft, level ground, if possible. Use no shoes with high heel-corks, which, throwing the leg out of line, strain the sinews and cause wind-galls, thorough-pin and spavins. Use a Goodenough shoe when the shoes are replaced, and bandage the part of the leg with a long narrow strip of cotton-cloth, and keep it wetted with cold water, with tincture of arnica added in the proportion of one ounce to each pint.

"Alfalfa," or Lucern.—"M. A. C.," North Topeka. It is in vain to try to raise lucern (or the so-called alfalfa), unless the ground is free from

weeds. Then it should be sown early in spring, in drills 9 inches apart, which might be cultivated with a walking sulky cultivator, by changing the teeth to snit the rows. In this way it would make a very rapid growth and soon cover the ground. It should be cultivated every spring in the same manner, if the ground is at all weedy.

Sowing Clover and Timothy.—"V. W. K.," Union Co., Ill. Clover and timothy may be sown in July. We once had an excellent stand, when they were sown with a crop of buckwheat on the 12th of July. On that occasion, 150 lbs. of Peruvian guano, sown with the seed, no doubt helped the grass and clover.

Feed for Early Spring.—"C. H.," Reno Co., Kan. The best feed for early spring is rye sown early in the fall. The ground may be prepared now or next month, and if low, it should be ridged in narrow lands, not over five paces wide. This will keep it dry during winter and spring. It may be pastured, and the ground afterwards plowed for corn.

Horn Ail.—"O. E. S.," Bath, Me. The disease known as horn ail, is not a disease of the horn at all, but a general constitutional disturbance, resulting from various causes, which shows itself by inflammation of and suppuration from the bronchial tubes, and the nasal lining and sinuses. It is very similar in effect to what is known as the epizootic in horses. It is probably better characterized as influenza, or catarrhal fever. There is much fever, dullness, and heaviness of the head, with heat around the base of the horns, and general distress and suffering. The best treatment is to give a purge, if the bowels are constipated, but if there is considerable looseness, an ounce of aromatic spirits of ammonia might be given, in a pint of water. The feet should be bathed copiously in hot water, and the body should be rubbed briskly with a coarse woolen cloth, and afterwards clothed with a blanket. If perspiration and discharge from the nostrils can be induced, a cure is begun. To effect this, a bag of scalded chaff should be hung around the muzzle, and wetted occasionally with hot water and vinegar. After the bowels are regulated, two ounces of sulphate of potash may be given night and morning, until the fever is removed. Good nursing, plenty of cold water, and soft bran mashes, will finally bring the animal round again. If the disease is neglected, pneumonia may follow it, and is generally fatal. It usually follows a hard winter and poor keep.

Soiling Crops.—"Subscriber," Kendallville, Ind. Without knowing the exact condition of the soil, it would be difficult to say what would be the best grasses for a permanent pasture. On a strong, clay loam, however, it would be safe to sow in August, or early in September, 6 quarts of timothy, 1½ bushels (21 lbs.) of orchard grass, and 1 bushel (14 lbs.) of Kentucky blue grass. The ground should be made very fine, and should be rolled after seeding, instead of being harrowed, which would cover the seed too deeply. In the spring, 6 quarts of red clover may be sown upon the last snow. These grasses may be sown with rye, which may be pastured in the fall, if sown early, and then be cut for fodder in the spring. The blue grass will not appear until the third year, when, if the soil and locality are congenial, it may in time occupy the ground. Tares or rape may be sown now for late fall cutting for fodder, or cabbage plants be set out; these can be purchased very cheaply by the thousand, or white, yellow or Cow-horn turnips may be sown, all of which will make valuable fodder crops.

White Leghorn Pullets.—Miss "M. A. C.," Chataqua Co., N. Y., writes, that her 12 white Leghorn pullets have laid, in 5 months and 10 days, since December last, 103 dozen of eggs.

Underground Milk Cellars.—"W. J. H.," Brady's Bend, Pa. In the *Agriculturist* of October, 1873, we gave descriptions, and engravings, of buildings suitable for milk cellars, to be built in a bank.

Double-Yolked Eggs.—"A. D.," Louisville, Ky. The large eggs which contain double yolks are rarely hatched. If properly fertilized and successfully hatched, they would doubtless produce twin chickens, or by reason of a mechanical annexation of the yolks or growing bodies, they could produce malformed or monstrous chicks. A recent case of this occurred in Illinois, and is reported in a trustworthy paper. A chicken was hatched which had but one head, one neck, one breast-bone, and then the chicken separated into two bodies with four legs and four wings. The curiously malformed bird, or birds, was accidentally killed, and was found to have one heart, liver, and gizzard, but the intestines split into two about one inch from the gizzard, and there were two sets of them, one for each body. This was probably produced from a double-yolked egg.

Yield of Corn in Nebraska.—The State Board of Agriculture, of Nebraska, offered a premium of \$50 for the best yield of corn in that State in 1873. The premium was awarded to M. M. Nelson, of Cass Co., whose crop was raised on thirty-five acres of ground, which was broken two years before. The statement sworn to by the grower was as follows:

Yield of corn upon the 35 acres.....	3,202½ bushels.
Average yield per acre.....	91½ "
Weight of corn, per bushel.....	63 pounds.
Total cost of the crop.....	\$166.25.
Cost per acre.....	4.75.
Cost of corn, per bushel.....	5½ ¹⁰ cts.

The variety grown was known by the local name of Mahogany. The cost is made up of the very reasonable, or we may say, very low charges of \$1.25 per acre for plowing, 45 cents for planting, \$1.80 for cultivating, and \$1.25 for harvesting. We suppose the ears were stripped from the stalks, which were not "cut up," as is the method in the Eastern States.

Some Dairy Items.—"Subscriber," Colorado Territory. The lactometer is not made expressly for testing milk; its purpose is simply to test the specific gravity of a liquid. Used alone, it is a very fallible instrument, and is calculated to mislead as much as to instruct. A cream gauge should be used along with it, and then, in the hands of a skillful and judicious person, who is able also to use other tests in corroboration of its disclosures, it may be of some service. Any dealer in or maker of scientific instruments, or dairy implements, could furnish a trustworthy lactometer and cream gauge. We could hardly advise you to purchase at present Short-horns of pure blood for dairy purposes, with a view to profit. The cost of cows of a good milking strain would be such as to preclude any profit, with milk at nine cents a gallon. At present, this class of stock is held and dealt in by breeders only, and is therefore scarce. It is in course of distribution, and by and by, as its numbers increase, it will become reduced in price. But it has a large field to extend over, and until that becomes fairly occupied, we may expect to see the best strains of Short-horns retain a value which places them beyond the reach of a dairyman. However, it is probable that by searching amongst some of the breeders in Colorado, a young bull of good character could be picked up which might be crossed upon Ayrshire or extra good native cows with benefit. The Ayrshire and Shorthorn cross has produced some excellent dairy cows. In selecting a bull for this purpose, one should be chosen from a heavy milking dam, and having fine bone, a fine neck, wide chest, a loose mellow skin, and fine hair; the heavier beef-producing qualities may be ignored in a bull for dairy purposes. Butter at 35 cents a pound is more profitable than milk at nine cents a gallon, in a dairy of good butter-yielding cows.

Recent Discovery of Guano.—A short time ago, some extensive beds of guano were discovered in Peru, to the south of the Province of Tarapaca. An examination of the beds has recently been made by two surveyors, which were sent out by the Central Board of Engineers of Lima, Peru. Their report is of very great interest, as it shows that several large beds of guano, of excellent quality, exist in that locality. Those which have been surveyed, are estimated to contain nearly eight million tons; one of them alone contains five million tons of fine quality. These fortunate discoveries not only remove all fear of a present failure in the supply of guano, but indicate that there are yet other undiscovered beds in existence, which will provide a practically inexhaustible supply.

Peach Borers.—"L. F. M.," Piedmont, Mo. We doubt if coal oil or any other application will destroy the borer, when once at work within the tree. The only sure treatment is to kill the grub by some mechanical means. In the peach districts of Delaware and Maryland, "worming" is done as soon as the crop is off, as then there is a plenty of labor at hand. Each person is provided with a hoe, to remove the earth from the base of the tree, a strong knife, to cut away the bark and wood, to find the channel of the borer, and a wire or whalebone, to pass into the hole, and kill the invader. As the borer often enters considerably above the base of the tree, we can not see how coal oil, applied to the roots, will reach it.

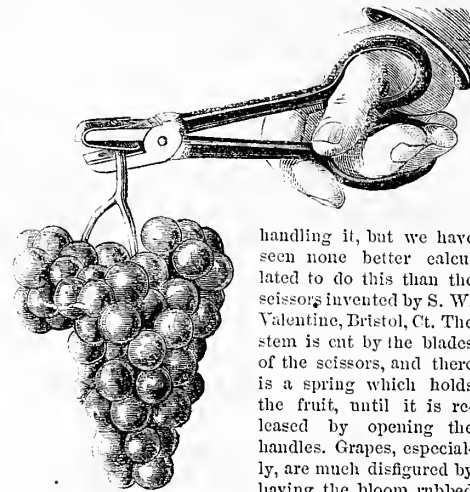

Clean Seed Wheat.—"H. K.," Green Bay, Wis. Our course to procure seed free from weeds, is to go through a portion of the field, and gather every head of cockle and other weed that could possibly be harvested along with the wheat. This portion of the grain should be kept separate from the rest, and thrashed by itself, and kept expressly for seed. The usual careless habit of throwing the screenings from the grain into

the barn-yard, is the source of a great part of the weeds upon farms. All such trash should be either burned, or, if mixed with light grain, ground, and fed to hogs or fowls.

Old Brood Mares.—"Horseman," Orange Co., N. Y. There have been many cases of mares breeding after the age of twenty years. The famous Lexington was foaled when his dam was twenty-three years old, and the dam of Dexter now has a foal at foot, and she is in her twenty-seventh or twenty-eighth year. The mare Katydid is recorded as having a foal at twenty-eight years.

Fine Mushrooms.—The finest exhibition of mushrooms we ever saw, was seen a few weeks ago at the seed-store of James Fleming, 67 Nassau street. For size, abundance, and excellent shape, they were truly remarkable. We learn that they were raised by Samuel Henshaw, gardener to J. C. Green, Esq., New Brighton, Staten Island, the same successful cultivator, whose improved Mignonettes was mentioned last month. Mr. H. has a cellar arranged for mushroom growing, and we hope he will give our readers an account of the method, which produces such fine results.

Grape Scissors.—There have been several contrivances for conveniently picking fruit, without

handling it, but we have seen none better calculated to do this than the scissors invented by S. W. Valentine, Bristol, Ct. The stem is cut by the blades of the scissors, and there is a spring which holds the fruit, until it is released by opening the handles. Grapes, especially, are much disfigured by having the bloom rubbed off by handling, and this will allow the picking to be done without touching a berry. The engraving shows the form of the scissors.

Rhubarb and Tomato Wine.—"N. M. L.," Iowa. Almost any fruit or vegetable juice, mixed with an equal measure of water, with about three pounds of sugar to the gallon, and allowed to ferment, will form an alcoholic liquid. That anything bearing the remotest resemblance to wine can be made from either tomatoes or rhubarb, we do not believe. We have seen many samples, which in the opinion of the makers were good, but in our opinion very poor stuff.

Breaking for Hedge Rows.—"C. C. R.," Barton Co., Kansas. The ground for a hedge row should be broken in August. The strip broken should be at least six feet wide, and should be plowed deeply, with an open furrow in the center. Just before frost, the ground should be plowed back again, filling the dead furrow, and turning one more furrow of sod upon each side. Early in spring, the ground should be plowed once more, throwing a ridge in the center of the row, upon which the hedge plants should be planted. The hedge will thus stand in the center of a ridge, not less than eight feet wide, and with a deep furrow upon each side, for drainage. If fire is feared, a fire guard, of six feet wide, had better be plowed around the fence. The fence row must be kept well cultivated.

How to Make a Root House.—"W. J.," Reed City, Mich. Full directions for making root cellars of logs, were given, with illustrations, in the *Agriculturist* for October, 1873, page 376.

As to Pickles.—"Gardener," Albany, Ind. The usual market value of cucumbers for pickles is about the same all over the country. We have known but little difference between the prices in New York and the Western cities; if any, the prices in the West are higher. In New York, pickles come to market packed either in brine or vinegar, in barrels of forty galls. and half barrels. The barrels hold 1,000, 2,000, or 3,500, according to size, and are now worth \$14 to \$16. The half barrels hold 500, 600, 800, or 1,000, and sell for \$4.75 to \$6.00. The favorite size are the smaller ones, of 600

to the half barrel; these bring \$5.50 at the present time. The fresh gathered "pickles" are generally sold to persons who pack them, at \$1.25 per 1,000. The packers put them down in brine, and sometimes keep them two years, when the demand is dull. The value in Chicago or St. Louis is about \$16 a barrel, generally. An article on pickles will be found on page 262.

Draining "Sticky" Land.—"J. N. Z.," West Charlotte, Ohio. Black sticky land, with a clay subsoil, would undoubtedly be improved by draining. Much of the sticky character would probably disappear after it is freed from water, and it would become looser and mellow. This effect has repeatedly been realized by draining, and it is one of its most marked improvements. At all events, it would be safe to experiment upon a strip at the lowest part of the land first.

Disease amongst Lambs.—"J. E. G.," West Falmouth, Mass. We know of no disease amongst lambs, attended by such symptoms as soreness of the eyes, and swelling of the eyelids, unless it be what is known as ophthalmia. This is accompanied with considerable general disturbance of the system, as shown by a dry, hot mouth, loss of appetite, and suspension of rumination. The wool feels harsh, and the lambs keep away from their companions. It is probably due to poor keep, and when on a bare pasture, the flock is exposed to the reflection of light and heat, from the bare ground. Cold, damp, and exposure to cold winds, will also produce it. Immediate care is needed, to avoid ulceration of the eye, which frequently follows the inflammation. The lambs should be kept up in a dark stable, and a few drops of a solution of one grain of chloride of zinc, in an ounce of water, should be syringed into the eye four times a day. Rags, dipped in a mixture of a pint of water, and two ounces of laudanum, should be hung, by means of a string, around the head, so as to cover the eyes. A tea-spoonful of Epsom salts, dissolved in water, should be given to each lamb, and a quarter of a pound of louse-meal daily, would be a help.

Bees.—Some one at Dennisport, Mass., sent his letter without signing it. Had he given his name, we should have sent him Mr. Quinby's circular, which would have answered his questions.

The Dairy in the North-west.—"W. S. S.," Chautauque Co., N. Y. There is no risk whatever as to the quality of the product in dairying, in either Kansas, Nebraska or Minnesota. The native grasses of the prairies are abundant, and produce excellent butter and cheese. We have never seen anywhere else, than on these prairies, such high-colored or sweeter flavored butter or richer milk. The very common grass, with narrow leaves, known as *Bouteloua*, and which is frequently mistaken for Buffalo-grass (*Buchloe dactyloides*), is productive of very rich milk, and the best of butter. This grass does not disappear, as the Buffalo-grass does, when the prairies come to be occupied by settlers, and it would doubtless furnish the most valuable, although rather thin, pasture for a number of years, if indeed it would not be permanent. The late prairie grass is also nutritious, and gives a heavy crop of hay. The chief drawbacks are want of water and shelter, but the first exists only in some localities, and the other will soon no longer exist. Already there are abundant openings for cheese factories and creameries, and in many cases tempting inducements are offered by the farmers for dairymen to go in and erect factories.

Summer-Fallowing Prairie.—"M. A. C.," North Topeka. We would not summer-fallow a prairie soil that is rich in vegetable or soluble mineral matter. The chief object of summer-fallowing is to kill weeds, but they may be killed without it. Another object is to work up and expose a hardly used soil to the air and weather, to mellow it and improve its condition. But on a soil that is already in good condition, yet full of weeds, it would be just as well to let the weeds grow, and plow them under before they blossom. If the greater part of the seeds can be destroyed, by one or two plowings in this way, a great good may be done, and the land may then be put in fine condition for a fall wheat crop. But we would encourage the weeds to grow, and keep the ground well covered until it is again plowed, rather than keep it bare by constant harrowing. A well-cultivated corn crop would answer the same purpose.

What is "Pi"?—"E. W. C." The word "pi" means a quantity of type scattered irregularly. In the puzzles on the last pages of the *Agriculturist* it means letters out of their proper place in the words, and thus meaning nothing; the puzzle is to so re-arrange the letters as to make the words read correctly. This gives amusement to both children and old folks, and helps to make boys and girls think quickly

Health of Farmers.—The Massachusetts State Board of Health, in their fourth annual report, have a paper upon the sanitary condition of farmers, based upon the reports of the country physicians throughout the State. Evidence collected for 23 years past shows that the average length of the life of a farmer, in that State, is 65½ years. This is much longer than that of any other class of citizens. The class most nearly approaching farmers, viz.: out-door mechanics live only 52½ years on an average. But the almost unanimous opinion is that farmers might live much longer than they now do by exercising more care in choosing, cooking, and eating their food, in avoiding overwork and exposure to change of weather, and the use of foul drinking water. Their food consists too much of pork, pies, and saleratus bread, and cakes. The cookery is bad, and meals are eaten too quickly for good digestion when work hurries. More vegetables and fruit should be eaten, and more rest taken. More cleanliness as regards out-houses, sinks, and back-yards, should be observed, and more care taken to avoid leaving cess-pools, sinks, etc., nearer a well than 30 feet at the least.

Sale of Shorthorns.

The sale of the Forest Hill herd, property of J. H. Spears & Sons, took place at Jacksonville, Ill., May 27th, the forty-three animals bringing \$33,000. The bull Cherub 2d (one year old) was sold to Gen. Charles L. Lippincott for \$5,800, the largest price ever paid for a yearling bull. The cow Duchess of Sutherland was sold to Gen. Lippincott for \$1,600, and her bull calf to S. K. Reigins, Petersburg, Ill., for \$1,050. These were the highest prices paid. The purchasers were all residents of Illinois, Indiana, and Iowa, the majority of the animals remaining in Illinois.

It is stated that Mr. Geo. Robbins, who bid \$14,000 for the Second Duke of Hillhurst at Col. King's sale, did not come to time in making satisfactory "arrangements," and the bull remains in Col. King's possession. We understand that he has refused all offers to purchase it since.

The joint sale of the shorthorn herds of Messrs. Taylor, Pickrell, and Elliott took place at Decatur, Ill., May 28th. The Lonans of the Taylor herd sold well, Lonan 6th (bought by E. W. Miller, Lullu, Ill.) bringing \$2,110; Lonan 4th \$1,760 (to J. Nichols of Bloomington, Ill.); Lonan 5th \$1,300, to Claude Matthews, Clinton, Ind.; Lonan 3d \$1,100, to Emery Cobb, Kankakee, Ill.; Lonan 8th \$1,200, to Edward F. Iils, Springfield, Ill.; Oxford Duchess, \$1,025, to J. Nichols, Bloomington, Ill. The imported bull, British Flag, three years old, sold for only \$530, (cause, bad temper). The cows in the Taylor herd brought an average of \$850. The Elliott and Pickrell herd sold at an average of about \$300.

Notes upon other sales will be found upon page 259.

Swindling by Mail.

The mail trade of seedsmen, florists, and the like is now very large, and though from the nature of the case there is more or less delay and loss, yet it is on the whole a great convenience to dealers, and a great saving to purchasers. Among its disadvantages to the dealers is the fact that it allows of a considerable amount of small swindling, and there has grown up a set of knaves who systematically swindle them. Their mode of operation is generally to send an order, stating that the money is inclosed. The dealer finds no money, but the writer claims that he sent it, and it must have been lost, that he can ill afford to lose the sum, and appeals to the sympathy of the dealer, who, rather than have his customer suffer, usually sends the goods. These cases have happened so frequently, that the dealers have compared notes, and discover that the same parties play the same trick upon the prominent seed and plant dealers all over the country. The following, from a highly respectable seed firm in Rochester, gives an account of the operations of one of these correspondents, which will serve as a sample of the rest:

"Our first experience with this class of 'unfortunates' was with a party who has befooled his misfortunes in losses of money by mail for several years, with the greatest steadiness and persistence, and is not yet disheartened; he has repeatedly been rewarded for his style, which is 'childlike and bland,' by confiding seedsmen and is not yet satisfied.—Mr. Ross A. Bagley, of Big Creek, Forsyth Co., Ga. His first letters to us claimed a loss of \$10.80, which, being a man far removed from money-order offices, and unused to mercantile pursuits, he had sent us in all confidence; this also contained a proposition that we share his loss, as he was not able to bear it. We supplied promptly the full amount we authorize to be sent by mail at our risk, without registra-

tion, suggesting that his letter might have been registered at the post-office, and we could do no more. Again he pleaded, and again was refused, he closed the correspondence with an appeal, from which we quote: 'Send the chromo any way, if you sympathize with a poor man, who wished and tried hard to be a customer. I should have remitted you the money at the start, if I could have done so, but it is my misfortune to possess but few of this world's goods, therefore I could not possibly afford it. . . . It is not my intention to ask for more than is right. I do not think the fault lies with you, and if you can not send the chromos willingly, we will drop the subject.' Our suspicion was increased by the studied air of modesty and confidence expressed in this note, and a gentleman connected with our house remembered the name as one that figured in a transaction where a neighbor of ours in the same trade had suffered considerably from an attack of Bagleyism. We found Mr. Jas. Vick possessing a file of papers in the familiar chirography of Bagley, and that he had an experience similar to our own. Seeking further to know the probable extent of the business as done by this particular individual, we requested information from other houses in the same line, and the responses came promptly, and of similar tenor. 'Mr. Ross A. Bagley,' say Messrs. B. K. Bliss & Sons, 'has favored us with his patronage,' and proceed to give in detail a repetition of the familiar story of a loss by mail and a request for remuneration. Peter Henderson & Co. say that 'in 1873 that accomplished rural rascal, Bagley, of Big Creek,' had found them out, and bitten them, but not deeply, for which they are deeply thankful. Jas. J. H. Gregory has a matter of a few dollars, for furnishing Bagley with seeds the last fall and the present month. We also learn from Reising & Hexamer that he attempted to victimize them. It seemed to us that such frequency of misfortune should not be permitted to remain in obscurity, or a success achieved by such effrontery and low cunning be allowed to continue, and we present this case as one fit for exposure by the *Agriculturist*, to which other specimens of this new pest may be added by ourselves and other dealers. We do this as a protection to the trade, by giving timely notice to those who might otherwise suffer, and also warn any who might hope to escape detection in the 'ways that are dark and tricks that are mean,' by the pitiful littleness of the act.

CHASE BROTHERS & WOODWARD.

"Rochester, N. Y."

Bee Notes.—Advice to Beginners.

BY M. QUINBY.

Cattle, while running wild, and receiving no attention from man, give him but very little towards his support. But after studying their nature, and cultivating it, he has from them, in addition to the hide and tallow, many of our choicest luxuries—milk, butter, and cheese. Bees, in their wild state, furnish wax, bee-bread, and a little honey mixed with it. With the same attention to their cultivation, that we give our cattle, we can improve their products equally as well. Cattle thrive and grow when running wild; so do bees, in their native state; but such thrift satisfies only those who are ignorant of what may be done. Such persons maintain that the nearer we follow nature, the more certain we are of success; but it must be admitted that this course is not always satisfactory. Fruit will grow without assistance from man. We prune, to allow light, heat, and circulation of air, our object is not to prolong the life of the tree, but to promote the production of fruit. So with

TRACK OF THE MOTH-WORM.

bees; for the greatest success, attention must be given to a thousand little details, that have been too much neglected; and the person that judiciously attends to the greatest number of these, will succeed the best.

Since the introduction of the Italian bees, it has been discovered that they drive off the moth worm, much more effectively than the black bee. Yet when these are

not very strong, considerable inroads are often made upon them, and much time is consumed in mending the mutilated comb, and replacing brood that has been destroyed, making all the difference between a handsome profit, and nothing at all. In such case, the person who knows nothing of bees, would complain that they did not pay, just as he would if he took no care of his cattle, and expected a first-rate yield of milk, butter, and cheese. We should understand that the moth, having a burthen of eggs to deposit, seeks a place for them, and finds it, usually in some weak hive, and that the young, when they hatch out, will take the sustenance near at hand. Wax-comb is their natural food. The moth is active in a temperature so cool, that bees exposed to it will move but little, but creep close together, for mutual warmth, leaving a part of the combs bare. There the eggs of the moth will be deposited. As soon as the weather is warm enough for a few days, or the air is warmed by the bees, these eggs hatch. No mature moth lives through the winter. The egg or the worm will live in a moderate temperature, and mature in warm weather. When the female has her eggs ready, they must be deposited somewhere. If every hive is strong enough with bees, to cover the combs, they will not be allowed inside. In such a case, the eggs are left near the entrance of the hive, in some crevice, or where the bees, in passing over them, will attach some of them to the little pellets of pollen on their legs, and being small, they are packed with it in the cells. When the hive is warm, there is where they hatch first. Some persons have imagined that the moth, when it can find no other place to deposit eggs, visits flowers covered with farina, and leaves them, trusting to the bees to convey them to the hive with the pollen. I have not room to give all the indications of this, but I hope closer observation will decide whether it be so or not. In the humid atmosphere of the cluster in the hive, the moths' eggs hatch. If there is brood enough to consume most of the pollen, as brought in, the worms, as they hatch, are carried out, and little harm is done. The worm, when not removed, commences eating the waxen comb that surrounds it, making a passage large enough for its body, and spinning a silken gallery, inside of which it travels. When the colony is moderately strong, and the brood of the bee has changed to chrysalis, and is sealed over, the head of the bee's chrysalis does not touch the sealing, by near an eighth of an inch. Over the heads of these bees the worm travels, consuming the sealing and ends of cells, and spinning the gallery, to defend itself from the bees. Now is the time to assist the bees, before the worm has matured. Without the movable comb-hive, nothing of the kind can be done. When the worm has its growth, and has destroyed perhaps a thousand cells, and maimed or killed as many bees, it leaves the combs, and spins a cocoon, in which to repose for a fortnight or so, to change from a crawling worm to a winged insect. They may be found in crevices around the bottom, or outside, which are often not large enough to admit their body, though they seem to have no difficulty in biting away any soft wood, till the dimensions suit them. Not one moth ought to be allowed to mature, to lay eggs for a future progeny. Take advantage of their helplessness now, and destroy them. When allowed to arrive at this state, we have neglected one of the advantages of the movable comb-hive, and of the new method of applying smoke to keep the bees quiet. Examination should have been made long before this. In the middle of some warm day, when most of the bees are at work, quietly take off the top of the hive; have the smoke ready, of course; the day may not be so very fine, and you will find necessity of using it more; take off boxes, if any are in the way.

set them down, to prevent crushing the bees; now take out the combs, until you find sealed brood. If necessary, put on glasses, to be able to look closely, and if worms are at work, you will see a mark much like that shown in the engraving. With the point of a sharp knife pick this off till you come to the worm, which is to be dispatched. Perhaps it is not half its full size yet, and half the mischief it would do is warded off. I expect ladies to do this more effectually than those of the other sex, who are in the habit of doing what they think nobler work. It is a small matter to kill a moth worm; so it is a small matter to save a kernel of wheat. An accumulation of small matters is important. When the hive has but a little honey, and the moth's eggs hatch near the bottom of the cell, the worm hitches its way through the center of the comb, crowding the young bees outward, which does not immediately destroy their life; but the worm, in spinning its gallery, attaches its web to legs, wings, etc., of the bee, holding it so that it can not leave the cell when it has matured. They may be seen with their heads protruding, unable to emerge. As such bees are worthless when helped out carefully, it is well to cut them out, and find and destroy the worm or worms.

Strong stocks only are safe. I will not repeat now all the directions for securing strong stocks, but only add that every worm, small or great, should be thoroughly crushed whenever found, and one point towards strong stocks is gained.

Cabbages as a Field Crop.

The value of the cabbage as food for stock is rarely considered. Yet as a fodder crop to be consumed in summer when the freshness of the pastures is past, or as green winter fodder for young stock, fattening stock, milk cows or sheep, we know of none better. The value of the cabbage as compared with other fodder, known to be of the greatest excellence, may be seen by the following statement of the composition of the various substances here mentioned: for instance, there is in 1,000 parts of

	Water.	Ash.	Pot. ash.	Lime.	Phos. phoric acid.	Soda.	Mag. nesia.
Green clover	800	13.4	4.6	4.6	1.3	0.2	1.6
Green peas	815	13.7	5.6	3.9	1.3	—	1.1
Sugar beet roots	816	8.0	4.0	0.5	1.1	0.8	0.7
“ leaves	840	6.5	1.9	0.6	0.3	1.6	0.7
Cabbage	885	13.4	6.0	1.9	2.0	0.5	0.4

Considering the excess of phosphoric acid, which is the most valuable of all the constituents of the ash, the cabbage is seen to be quite equal to sugar beets as a fodder, while this excess gives to it a special value for young and growing or milking animals.

Again if we compare the amount of valuable organic matter contained in clover and cabbage, we find the following, *viz.*, in 100 parts of

	Water.	Albuminoids or fresh forms.	Carbo-hydrates or fat formers.	Fat.	Crude fiber.
Clover	80	3.3	7.7	0.7	4.5
Cabbage	89	1.5	6.3	0.4	2.0
Turnips	92	1.1	5.1	0.1	1.0

Thus although cabbage is not so nutritious as clover, yet the large amount of water it contains makes it a valuable fodder for winter when given with dry food, and it contains a very small portion of crude indigestible matter. It is, however, considerably more nutritious than turnips. The carbo-hydrates consist mainly of starch and gum. These substances are largely consumed in the respiratory process and help greatly to maintain the natural heat of the animal. As a winter food, therefore, the cabbage is seen to possess a high value, being superior to turnips and only slightly inferior to clover. From our own experience with it we consider it the very best food for ewes previous to and after lambing, as it causes a large flow of milk; and also far better than turnips, because no cutting is necessary and there is no danger of choking. The same advantages apply to it as feed for milk cows. For its culture considerable previous preparation is necessary, and for a crop for next season it is not too early now to begin to prepare the seed-bed. One great advantage of this crop is that a succession may be grown and an early crop may be ready for use in August, at which time it will be found of the greatest value for cows that are in milk. For this early crop the plants must be grown in the fall and wintered over in cold frames. The bed for the plants should be chosen in a dry, warm, sheltered place, and the soil should be carefully dug over with the spade or the fork, and made fine and mellow, and rich with well-rotted manure. For each acre of crop a bed of two square rods will be sufficient, upon which space one pound of seed should be sown. Drill sowing will be found more convenient than broadcast, as it will be necessary to keep the bed clear from weeds and the hoe can be used

between the drills. The seed should not be sown until the end of August or early in September. We have found the large Drumhead the best for this early crop, as it is very hardy and upon rich ground comes forward quickly in the spring and grows to a large size. Heads weighing twenty pounds and over are not uncommon in a field of this variety. When the plants are about four weeks old it is best to transplant them to the spaces between the drills, by which they are checked in their upward growth and make more stocky plants with more spreading roots. The frames may be made by placing boards upon their edges between the rows about four feet apart, and nailing strips to hold each pair of boards together. The strips may be nailed about three or four feet apart, and loose boards laid between the strips to complete the covering. The loose boards may be removed during the days when the weather is not too severe, to give light and air to the plants. Upon very cold nights straw or coarse hay may be heaped upon the frames for protection.

The ground for this crop may be a corn or oat stubble plowed in the fall and manured well with ten to twelve two-horse loads of fine manure directly upon the plowed ground. The soil and manure should be mixed by a thorough harrowing or working with the cultivator, and then lightly cross plowed and left rough until spring. In spring, as early as possible, the ground should be harrowed level and marked out into rows three feet apart. A dressing of 200 pounds of fine bone-dust, superphosphate of lime, or guano spread in the rows will be found of great benefit. The plants should be set out two feet apart in the rows, and if troubled with the flea they should be dusted over with fine dry-slacked lime or soot. Clean cultivation is needed. A later crop may be made from plants sown in a hot-bed in March and planted out in May and June. For this crop we have found the Early Winningstadt an excellent variety, and growing to a good size. The late crop will be raised from seed sown in an open bed in May and planted out in July, and the Marblehead Mammoth or the Drumhead are probably the best varieties. If a piece of clover sod can be plowed and well manured early in this month, it will pay to purchase plants from the seedsmen if they have not been prepared at home. A good clover sod turned under has yielded us an excellent crop, and we have also raised a good crop by planting cabbages between the hills of corn and working them with the hoe. For these late crops and such a catch crop as that raised with corn we have found Peruvian guano or fish guano the best fertilizer. With a small handful of fish guano with every plant we have raised some good cabbages in a cornfield; but where a piece of ground can be specially devoted to them it will be found the best, although where it can not be had we would by all means raise what we could in every available spot, either with the corn or in vacant spaces amongst the potatoes. Over 7,000 plants may be raised upon an acre, and if by careful cultivation and liberal manuring heads of an average weight of six pounds only are grown, there will be twenty tons of most excellent and healthful fodder. Such a crop is by no means beyond the range of probability where the proper attention is given. We know of few crops which return a greater value for the labor expended, and it is one which stands heat and drouth better than turnips and equally well as mangels.

Ogden Farm Papers.—No. 53.

I have had an unusual amount of correspondence lately concerning land drainage, and there is evidently a decided revival of interest on the subject among farmers in various parts of the country—enough to justify a repetition of some points which are to be found in detail in the books on draining.

To begin with, there is no special charm in burned clay which will make wet land dry, and poor land rich, by the mere effect of its being buried a certain number of feet below the surface. In fact, the *material* in itself has nothing whatever to do with the effect of a drain, so long as it remains good. What is needed is an open channel, at the proper depth, through which water can find its way; having a continuous fall, so that it will be easier for the water at every point to run off through the opening than to soak away into the ground; and placed at a sufficient depth to leave enough dry soil above it for crops to grow to the best advantage. If such a channel exists it makes no difference what means have been used to obtain it. While it exists and is kept open from end to end, it will answer all the purposes of a good drain, whether it is made of tiles, of stonework, of gravel, of plank, of brush, or of any other material. A drain made by a mole-plow, so long as it remains a drain, is just as effective as though it were laid with the best tiles.

The considerations which should decide us in selecting the kind of drain to be used are *cost* and *durability*. The best, and in the end the cheapest, drain—where tiles are accessible at reasonable cost—is one properly laid with a good quality of small round tiles, having collars or sleeves to keep the pipes in line, and to increase the facility of entrance of the water. Such a drain is practically indestructible, and should last as long as the land itself. Where good gravel can be had on the farm, an excellent drain may be made by digging a narrow ditch and filling it to a depth of six or eight inches with gravel from which all stones over an inch in diameter and all fine dirt have been carefully screened. A drain made in this way will last almost indefinitely, and will be comparatively inexpensive. Brush laid in the bottom of a wider ditch, well tramped down, and covered with inverted sods before the earth is thrown in, will often last for many years and do good service. Poles and board trunks are also pretty good.

Stones are a favorite material, and it is possible to make a good and permanent drain with them—but they have the disadvantage of being very costly. It is a quite common opinion that tiles are more expensive than stones. I should say that wherever the smallest tiles can be laid down on the farm for \$50 per thousand feet it will be cheaper to use them than to use stones, although these may be immediately at hand. A ditch for a tile-drain requires certainly not more than three-fifths as much digging and back filling as one for a stone drain, and the cost of collecting, handling, and placing the stones will usually be nearly if not quite as great as the cost of tiles—it is often more. Because the stones are procured and put in place without the actual outlay of cash, the expense is not always felt; but if it does not cost money, it does cost money's worth, and it would often be an economy to work out by the day and use the wages to buy tiles rather than to spend so much labor in hauling, preparing, and handling stones.

Good gravel, prepared as above stated, is often

cheaper than tiles, and it is better than stones. In making stone drains there is a preference in favor of using broken or small stones rather than to lay what is called a "French" drain, or a drain with an eye, because the latter requires the water to flow over an earth-floor, which it washes more or less according to the character of the soil, often undermining and displacing the stones which form the eye, or washing earth away from one place to deposit it in another to form an obstruction. Furthermore, surface water often breaks through from the top of the drain, carries dirt and rubbish into the channel to choke it, and helps to disarrange the stones. In using any other material than tiles, it is better to have a drain through which the water will *trickle*, than one through which it will *run* in a copious stream. This is the reason why a drain made with gravel or small stones is better than one made with large stones. It is better because less liable to become disturbed and made useless. One obstruction makes all the drain above it useless—often worse than useless—from the water accumulated in the upper part of the drain breaking to the surface at the obstructed point, and making a considerable tract springy and unfit for the production of good crops.

Another point connected with the draining of land often receives less attention than it merits. So much is said and thought about under-draining that there is too much disregard of the less important surface draining. Some soils are so tenacious that, no matter how well they may be underdrained, they will not allow the water of heavy or long-continued rains to pass through them so rapidly as it should do. In all such cases there should be surface gutters—more or less wide—to allow surface waste to pass off at once. These gutters should be always kept in grass, in order that the ground may not be worn away by the current.

It may be accepted as a principle that all farming land should be freed from the presence of excessive moisture beneath, and of surface water at the top. This is absolutely necessary to the economical cultivation of anything but rice and cranberries. At the same time, the work may be done much more cheaply than is usually supposed, and the exercise of a little common-sense will show that the desired result may be obtained more directly, more simply, and more cheaply than by the course often adopted. Many think that they must skirmish with soil water, coax it to run where it is not inclined to, circumvent it, attack it with "hering-bone" drains or "gridiron" drains, or apply some other "scientific" means to get rid of it. In draining, as in everything else, the scientific way is the simple, straightforward, practical way. The end to be accomplished is to take water from where it does harm, and lead it to where it can do no harm, and the natural law on which the whole process is based is this: Water runs down hill, and straight down the steepest slope of the hill. Consequently, if we wish to remove the water from a certain tract, we should not carry it diagonally, nor indirectly across the slope of the ground, but straight down the steepest descent, just where it would run had it its own choice. It is often required to collect the water of a number of lateral drains and lead it toward a convenient outlet, and to do this by following a line diagonal to the slope of the land, but the laterals themselves—the real drains—should run in the direction in which the water itself would run were it flowing over the surface. The reason for this is that this is the natural way

for it to flow, and that if the drain is laid in this direction, the tendency of the water will be to follow it—while if another direction is taken, the tendency of the water will be to leave the drain and seek the more direct fall. If the land is made wet by a spring, the proper plan is, not to go around Robin Hood's barn to cut the spring off; but to "hit him straight in the eye." Take the spring where it is and as it is, and tap it at the point where it accumulates all its water—then its entire removal will be certain. Any other course will be more expensive and less effective. Springy hill-sides must be treated on the same principle: strike straight and deep into the water-bearing stratum, and give the water an easier and lower vent than it finds at the surface, then carry it by the most direct route to the bottom of the hill.

To drain a wet place of a few rods, it is not necessary to underlay it with a cobweb of drains; one drain cut quite across the whole width of the wet ground will often prove sufficient. It is one of the sources of expense in draining that too many drains are made. As a rule, if the complete and thorough drainage of the whole land is not needed (and often it is not), and if it is the chief object to bring the soil into good grass-bearing condition, the best course will be to drain the wet spots by as few drains as will do the work, to tap all springs which it is desired to get rid of, and to arrange for the complete removal of all surface water. Of course, the complete and thorough drainage of the whole land often is necessary. It was necessary at Ogden Farm, and the whole place is underlaid with tile drains, four feet deep, and forty feet apart; there are over thirteen miles of them. When work is to be done on this scale, the owner will take more comprehensive advice than could be given in a newspaper article; but it seemed probable that a few hints for men who do their own engineering, and much of their own work, would be as useful as anything that the past month and its letters have suggested.

The cost of tile draining—which for many reasons is the best wherever it is practicable—can not be exactly stated, for much, of course, depends on the character of the soil and on prices. In fair, solid clay, where not more than one-half the earth has to be loosened with the pick, a first-class tile-drainer, with proper tools, will dig, lay, and back-fill five rods per day, 4 ft. deep, 14 inches wide at the surface, and from 2 to 3 inches wide at the bottom. He takes out 45 cubic feet of earth for each rod of drain. An ordinary laborer would insist on a much greater width of ditch, (with ordinary tools he would need it), and if the drain were to be made with stones, a greater width would be necessary. Such a workman making a ditch for stones, say 4 feet deep, 24 inches wide at the surface, and 16 inches wide at the bottom, would throw out 110 cubic feet of earth for each rod of drain. The cost of twice handling the extra 65 feet of earth would be generally enough to pay for tiles, unless the location were very remote from a factory; it would often be much more than enough. The relative difference is equally great in making drains only 3 feet deep.

One other matter in which it is common to make a mistake, is in the size of tiles used. If of good form, and with well-fitting collars, 14-inch tiles, laid with a fall of six inches in 100 feet, are ample for the removal of the rain-fall on an acre of land, and—to skip intermediate details—6-inch tile is sufficient for 40 acres. Of course, spring water (which is the rain-fall on

other land brought underground to ours) will affect this rule, but less than is often supposed.

Now and then, by way of encouragement, I look back over the history of some of our Jersey cattle investments, and trace the directions in which particular strains of blood have been disseminated. Here is an instance: In the winter of 1867-8 we bought from Mr. Hartman Kuhu, of Philadelphia—together with some others—a young heifer to come in the next summer with her first calf. The price paid was \$350. She arrived here safely, and did well. Her first calf was a bull, and in those days we did not consider a bull calf worth raising. The next (1869) was a heifer, Nora; the next (1870) a bull, Nebuska, used here as a yearling, then sold for \$200, and went to Mississippi. In August of that year Nelly was sold for \$750, and went to Massachusetts. In 1871 Nora had a heifer calf, Noreina; in 1872 a bull, Norajah, sold for \$100, and went to Connecticut; in 1873 a heifer, Donora, sold for \$175, and went to Tennessee; in 1874 a heifer, Belnora. In 1873 Noreina had a bull calf, Belnor, sold for \$100, and went to Jefferson County, N. Y. She will be due to calve again in a few days. Nelly, Nora, and Noreina have always been very profitable from the time of first calving. The sales named above amount to \$1,325, and we have still on hand Nora, Noreina, and Belnora. This result, in a little more than six years, from an investment of \$350, is satisfactory. We have others whose report would be quite as favorable.

This number will reach its readers too late for the beginning of the haying—too late for the bulk of it, where farmers understand their best interests—but there will still be a great breadth to be cut, and it is not too late for the repetition of an oft-made suggestion—which I repeat, because my own experience has convinced me of its great value. There is but one *best* way of doing anything, and the *best* way to make hay is the following, or if it is not, pray let us have information as to a better one: 1. Start the mowing machine after five o'clock in the afternoon, and do no cutting after the dew is off of the grass in the morning. 2. On the first clear morning after the cutting, but not until the dew is well off, start the hay-tedding machines—as many of them as can be got hold of—and keep them going without unnecessary intermission until the last lock is hauled into the barn, or until the dew begins to fall in the evening. The more constantly the hay is stirred the better it will cure. 3. Begin hauling early enough on this same day to get all that has been cut safely into the barn or stack. By this process the crop will be put in in the best possible condition, and though it may *look* too green it will be quite safe to keep (if it has been well stirred), and will "spread" better than if made by any longer process. Should rain follow the evening cutting, no harm will be done, for the grass will not have its nutritious parts leached out until it has first been wilted.

Carriage and Pigeon House.

"A Subscriber" asks for a plan for a carriage-house with an apartment above for fancy pigeons. We give herewith a plan with elevation of a building adapted for these purposes. Fig. 1 shows the elevation of the building which has a carriage-house and stable for two horses below, a hay-loft above, and a pigeon-house above the loft. An lighting board runs

around the outside of the pigeon-house above the roof of the loft, and a ventilating cupola

Fig. 1.—CARRIAGE AND PIGEON HOUSE.

is placed upon the top. The arrangement of the interior of the stable is shown in fig. 2, and that of the pigeon-house in fig. 3. The nest-

Fig. 2.—PLAN.

Fig. 3.—SECTION.

boxes are placed upon shelves around the walls, and a trap-door in the floor near the wall gives access from the hay loft.

Natural Pastures.

We recently had the pleasure of visiting a farm in Litchfield County, Ct., where a large portion of the pasture land had never been plowed. There was at least one hundred acres, containing a good variety of soil and exposure, that had received no care from the hand of man since the forest was cleared off a hundred or more years ago. Some of it was hilly and strewn with boulders, some quite smooth and available for the plow, and other portions moist and covered with coarse grasses and rushes. The present owner and manager is eighty-five years of age, and has been in possession for sixty years, and one of his hobbies is natural pasture. He has followed the raising of Devon cattle and Merino sheep nearly his whole life, and these have been the important crops sold from the farm. The pasture retains all the natural grasses that originally grew upon the soil. The surface mold formed by the decay of the leaves and stumps of the forest has never been disturbed or exhausted by tillage. The annual crops of grass have been consumed by sheep and cattle, and the most of the manure has been left upon the soil. The raising of cattle to sell for stock has this advantage over dairying. The cattle are left in the pasture through the summer, while the cows are brought up to the milking yard at night, and at least one half of the manure is left in the yard. Sheep are in the pastures

through the season, and their manure is quite evenly distributed. If there is any excess in any part it is upon the high ground and hill-tops, to which they generally resort at night, or when they are lying down. The portions of the pasture that are most exposed to washing and most likely to be poor receive the largest share of manure. The result of this treatment, in this case at least, is a complete vindication of the policy of keeping the plow out of land devoted to pasture. Everywhere there is a thick, heavy sod, and a good bite of grass, even upon the driest hill-top. There has been an increase in the capacity of the pasture to carry stock, and the feed is better now than it was sixty years ago. This man has attained a result by simple grazing with sheep and cattle, which others attain by expensive plowing, cultivating, and heavy manuring. May not the multitude of emigrants who are clearing away the forests in the new states and territories learn something from the experience of this old farmer? After the forest is cut away, and the trees and brush are burned, there is no need of raising wheat and corn several years to prepare the way for the grasses. If the grasses are not already there, the seed would catch readily upon the soft mold and ashes after the burning. The stumps would remain for a time, but they would not be in the way of sheep and cattle as they are in the way of the plow and the reaper. They would go to decay in a few years, and this decay might be hastened by burning after they were thoroughly dry. The ashes and mold would add to the riches of the soil and the luxuriance of the grasses. The thick, heavy sod, thus formed at little cost, would be a better investment than any bank or railroad stock. The cashier would not default. It could not be stolen. It could not be burned up. It would declare dividends while there were sheep and cattle to graze it, and a man to watch the herds and flocks. From what we have seen here and in other grazing districts of these natural pastures, we are convinced that a great deal of labor is worse than wasted in putting cleared forest lands into grass. CONNECTICUT.

Lolling of the Tongue.

We have had many inquiries as to a form of bit, best calculated to prevent lolling of the tongue in horses, and we now illustrate two kinds of bits, that are well designed to prevent this disagreeable habit. The principle upon which they are made, is to prevent the horse from getting his tongue over the bit. If this is prevented, the tongue is seldom thrust out at the side of the mouth. Figure 1 shows a bit, having an attachment at the upper side, and an extra ring, by which it is kept in its proper position. The tongue can not possibly be got over this bit. But we have occasionally seen a horse which would thrust the tongue out beneath the bit. For such a rare case, the bit shown at figure 2 is provided. The plate upon this bit swings readily, and whether the horse at-

Fig. 1.—BIT.

Fig. 2.—BIT.

tempt to carry the tongue out over or under it, it is turned, and prevents the movement. There can not possibly be any lolling of the tongue in this case. Both of these bits are made by Joseph Baldwin & Co., 254 Market street, Newark, N. J.

Binders for Sheaves.

The ordinary bands for binding sheaves are both wasteful of grain and time. A band that is ready-made, and which can be fastened in-

Fig. 1.—SHEAF-HOOK.

stantly and tightly, would be a great convenience. For binding corn it would be a great boon. We here illustrate two methods of making bands which are used by French farmers, and which would be found useful to us, inasmuch as they are easily made, quickly fastened, and hold the sheaves securely. Figure 1 shows the hook, which is best made of malleable cast

Fig. 2.—SHEAF BOUND.

iron. A cord is passed through the hole, and is knotted at each end. To bind a sheaf, the cord is passed around it and over the hook at the back, drawn tight, and then passed once around the tongue of the hook, and finally along the groove, and tucked in firmly between the straw and the hook, leaving the knotted end hanging loose. To unbind the sheaf, the

Fig. 3.—SHEAF-BINDER.

knotted end is pulled and the tie is loosened instantly. Figure 2 shows the sheaf bound with this tie. Figure 3 shows another and more simple tie, which is a long, narrow hook of stout wire, made with an eye at the end of the shank. This is attached to a cord knotted at both ends and at various places near that end which is distant from the hook. When

Fig. 4.—WIRE SHEAF-HOOK.

used, the cord is drawn tight round the sheaf and slipped into the hook, which holds the knot fast. Figure 4 shows another form of this tie, the catch for which may be made of strong wire, such as is used for fences.

Dutch (or Holstein) Cattle.

The engravings on this page are portraits of a Dutch bull and cow which took the first premium at the New York State Fair of 1873; they are the property of Gerrit S. Miller, Esq., of Highland Farm, Peterboro', N. Y. The bull, Rip Van Winkle, was imported in his dam in 1869, and is now four years old. The cow, Crown Princess, was imported from West Friesland in the same year, and is now eight years old. Her yield of milk in one day in 1871 was 74½ lbs., or about 34 quarts, and her average yield per day for six months was 50½ lbs., or about 23 quarts per day. Her feed was nothing but pasture during June, July, and August of this period. Mr. Miller

feeds his cows in spring six quarts of grain daily, and in fall and winter four quarts daily. We assume that this cow had the usual allowance during the other months than those mentioned, although we have not been informed as to that.

We are glad to have the opportunity of presenting the portraits of these two animals, because they are types of a breed of great intrinsic value and of great importance to our own dairy interest. The dairies of Holland have had a wide reputation for many years, and the Dutch butter and cheese have long been celebrated for their excellence. The Dutch cattle for generations back have been bred especially for their dairy qualities, but at the same time their large frames, well covered with flesh, have rendered them more than fair beef-producing stock. Some of the best qualities of the now fashionable Short-horns have been derived from the blood of the short-horn Dutch cows. The rich pastures of the alluvial fields of Holland have helped during all these years to build up a race of fine dairy cows prolific of milk, butter, and cheese, and which when they have be-

come no longer profitable for the dairy quickly take on flesh and fat, and yield an excellent quality of beef. The color of these cattle is white and black, their frames are large and well covered with flesh; their skin is fine, soft, and mellow, their constitutions are hardy and robust, they

possess the favorite points of dairy animals, are apt and hearty feeders, and arrive at an early maturity. Recently a bull of this breed was slaughtered in Philadelphia, and dressed over 1,600 pounds net weight of the choicest beef, portions of which sold in the market for fifty

butter of cows of various breeds, in which pats of butter were placed in a warm cupboard near a steam heater, and their behavior under these unfavorable circumstances noted, he says: "There was one sample of Dutch butter, one of Guernsey, seven of Jersey, and two of Ayrshire; a few days later another pat of Ayrshire butter was added. The Guernsey butter was very high colored; melting point 99°; had an oily rather than waxy look, but was very attractive; it molded in spots in about a month. The Jersey butters in about seven weeks were all slightly rancid; one sample lost its color in spots, the white spots left resembling tallow in color and taste; no butter flavor. The Ayrshire butters had lost all flavor, were poor, very poor, but scarcely rancid. The Dutch sample

the best preserved of the lot. This is another proof of the Dutch outranking the Ayrshire as a butter cow. The keeping quality of butter is certainly an important item in determining its value. As for the cheese qualities of the Dutch cow, if her cream and milk are so readily mixed, by stirring, it would give our cheesemakers but little trouble to secure the cream in the curd, as it is their custom to keep the night's milk in gentle motion to prevent the rising of cream. When comparing the Ayrshire and Dutch as dairy cows, it should be remembered that the Ayrshire has had a com-

paratively thorough trial in the best dairy districts of this country, and has been bred and improved here for many years; while with the Dutch improvement is just beginning. So far as my experience of four or five years goes, the Dutch have proved themselves equal to any, and are surpassed by no other dairy stock in the world. Not only is their yield of milk large, but the average proportion of cream it contains I have found to be at least 16 per cent." It would seem that Mr. Miller makes

out a strong case for his favorite breed, and the reputation of these cows in their native country will go far to support him in his claims. It can not be doubted that there is a large opening amongst our dairies for the introduction of cattle of such excellence as the Dutch cows.

PRIZE DUTCH OR HOLSTEIN BULL.

cents a pound. The Dutch cattle, then, may claim to be considered as first-class dairy animals and as respectable beef stock.

But it is as dairy stock we propose to consider them, and here condense from a communication sent us by Mr. Miller the following remarks in reference to the comparative excellence of the Dutch and Ayrshire cows as set forth by Dr. E. L. Sturtevant in a recent lecture before the Vermont Dairymen's Association, already alluded to in a previous number of the *Agriculturist*. It is admitted by Dr. Sturtevant that the cream of the Dutch cow's

milk rises more quickly than that of the Ayrshire cow's milk. Mr. Miller therefore claims that, as a butter cow, the Dutch should stand before the Ayrshire of a butter family even. Further, referring to the experiments of Dr. Sturtevant as to the keeping qualities of the

PRIZE DUTCH OR HOLSTEIN COW.

Walks and Talks on the Farm.—No. 127.

I had a visit the other day from four of the agricultural students at Cornell University. I enjoyed it very much. They were so genuinely enthusiastic and so anxious to learn. They got into the underdrains, examined the surface soil and subsoil, looked at the stones, the weeds, the crops, the fences, the implements, machines, horses, harness, whippetrees, pigs, sheep, grades, thorough-breds, lambs, and wool. It made me feel ten years younger to talk to such bright boys. One of them spent his last vacation on Dr. Hexamer's farm. Don't tell me that we have no young men who love farming, or that there is no call for agricultural colleges. There is a chance for Cornell to do something for agriculture yet. These young men speak highly of Mr. Roberts, the new professor of agriculture. I believe Mr. Cornell has always wished to give agriculture a leading position in the University. I hope he will yet do so.

"You have been predicting better times for farmers," said the Deacon, "but I don't seem to see them. Winter wheat looks miserable. Clover has been badly winter-killed. Old meadows are far from promising. The weather this spring has been cold and dry, and the crops have been put in late, and the prospects are that we shall have a light yield of oats and barley."

"This is a gloomy picture, Deacon," I replied, "but, admitting all that you say, I do not feel discouraged. When you say I have been predicting better times for farmers you do not quote me correctly. I have been predicting better times for good farmers."

The Deacon thought a moment, and then asked quietly, "What do you mean by a good farmer?"

This seemed a proper question to ask, but I knew the Deacon too well to suppose that he asked it with any other object than to get me into a corner. And so I thought I would touch the Deacon on some of his tender points.

"A good farmer is a man who feels that he was sent into this world to work and think. He has more faith in himself than he has in what some people call 'nature.' When the gooseberry saw-fly first made its appearance, he did not fold his hands and let the caterpillars strip every leaf from his bushes. He consulted the books, and found out that it was no new thing. He availed himself of the experience of those who had studied the subject. He set out some good varieties of currants in rows four or five feet apart, where he could keep the land clean and mellow with a horse hoe. He examined the bushes, and found hundreds of bead-like eggs glued to the underside of the leaves, and these he killed with his thumb and finger. He found, too, that the insect laid its eggs on the leaves of the young suckers. He cut off the suckers, and in this way not only killed thousands of eggs and young caterpillars, but strengthened the bushes by removing a large quantity of useless growth. He found that the lady-bugs came to his assistance, and he felt encouraged to persevere, and the result is that, while your old hedge-row currant bushes are used up, he gets a big crop of large currants that bring him \$5 per bushel. And so this insect, instead of being an injury, is in reality an advantage to him. He gets better prices and far greater profits than when he 'let nature take its course.' I use this only as an illustration of a general principle. The codling-moth

is destroying thousands and tens of thousands of barrels of apples in Western New York every year. A good farmer adopts means to hold them in check, and gets better prices for his apples than he would if there was no such insect. During the 'bearing year' he thins out his fruit, and the next year, when there is a light crop, he gets an average yield of fine fruit and big prices. It is the extra price and the extra yield that a farmer must look to for his profits. Take, for instance, an orchard of two hundred apple-trees, that produce 1,500 barrels of apples this year and 200 barrels next year. The crop this year is large and the fruit small, and it sells say for \$1.25 per barrel. Next year the fruit brings \$3.00 per barrel. It costs say 40 cents a barrel to pick, head up, and market the fruit, and 40 cents for the barrel. The returns are:

1874.—1,500 bbls. apples, @ \$1.25.....	\$1,875
Barrels, picking, and marketing, @ 80c.....	1,200
	\$675
1875.—200 bbls. apples, @ \$3.....	\$600
Barrels, picking, and marketing, @ 80c.....	160
	\$440

"On the other hand, suppose the orchard is in high condition, and instead of letting the trees overbear this year the owner thins out the apples and gets 1,200 barrels of choice fruit worth \$2.50 per barrel, and the next year 1,000 barrels worth \$3.25 per barrel. The returns are as follows:

1874.—1,200 bbls. apples, @ \$2.50.....	\$3,000
Barrels, picking, and marketing, @ 80c.....	960
	\$2,040
1875.—1,000 bbls. apples, @ \$3.25.....	\$3,250
Barrels, picking, and marketing, @ 80c.....	800
	\$2,450

"In the one case the returns in the two years from the orchard are \$1,115, and in the other \$4,490."

"But you do not know," said the Deacon, "that you will get \$3.25 per barrel for apples next year."

"Of course not, but I got it last year, and what has been will be. I am trying to give you my idea of a good farmer. What is true of apples and currants is equally true of other crops. I sold potatoes this spring at \$1.25 per bushel, hay at \$30 per ton, butter at 40 cents per pound, and good beef and mutton are so scarce that I judge, from what he brings us, our country butcher can pick up nothing but old Merino ewes and half-starved yearling heifers. A piece of good sirloin from a well-fattened three-year-old steer is a rarity."

"All this is true enough," said the Deacon, "but by the time we have anything to sell prices will be lower. I tell you, farming is a poor business, and if it was not for your fancy pigs you would not talk so cheerfully. If I could sell pigs at two months old for \$40 a pair I could make money by farming too."

"Now, Deacon," I replied, "that is what I call mean. Here you have been neighbor to me ever since I have had these pigs. And it was two or three years before I could persuade you to try the cross on common sows. Before this you had amused yourself and others by saying that they were too delicate for ordinary farm treatment, that they were too small for profit and too fat to breed, and, above all, that they were black, and that the butchers and packers would not buy black pork. My first litter of pigs were all killed but two. I felt discouraged, and all the consolation I got was, 'I told you so.' I took my pigs to the State

Fair. One of my neighbors was on the committee. 'I hate a black hog,' he said, and when the awards came out my sow was put last and a grade white sow first. The next time I exhibited I brought home half a dozen or more first-prize cards, but my best sow shortly after she came back from the fair was stricken down with paralysis and never recovered. 'Too fat, too high-bred, too delicate,' were the kind remarks I heard on every side. After this I had two sows due the same day. One had a litter of eleven pigs. It was a terribly cold night in March. I sat up with her myself until one o'clock, kept the sow and little ones warm by keeping them covered with a blanket. I raised nine of them. The next morning I found that the other sow had had ten pigs, and my men, not knowing how to keep them under the blanket, allowed them to get chilled, and finally carried them into the house in a bushel basket without any covering, and left them there squealing. When I got up, and took them back to the sow, they were too far gone, and every pig died. I have lost a good many animals in my time, but do not recollect ever feeling the loss so keenly as I did this—because it was sheer carelessness. Farmers all over the neighborhood lost a great many litters of pigs that spring from sows that were certainly not too fat or high-bred, but that did not matter. Mine died because they were too delicate. After this my luck turned. I had three sows that produced thirty pigs, and we raised every pig and sold them for \$25 apiece. They are scattered all over the United States, and have, so far as I have heard, given a good account of themselves. In that litter of nine that I saved during the cold night in March there were four sows. Two of them I sold, one to Mr. Weed of New York for \$100, and the other to Mr. Hardin of Kentucky for \$200. The other two I have yet. One we call Favorite and the other Rainbow. Neither of them bred until over two years old. Since then they have bred regularly, and have brought me in more money than any other two sows in the herd. I believe neither Mr. Weed nor Mr. Hardin had patience enough to wait for their sows to breed, and have abandoned the business. And you would do the same, Deacon. There is not one man in ten thousand who has the qualifications requisite for success as a breeder. My men who left the litter of pigs to die in the basket went into the woods to chop. It was what they were adapted for. It requires the patience and gentleness of a woman to take care of high-bred stock. Some time since a lady in Illinois wrote me that she was carrying on a farm for her fatherless children, and wanted some pigs. I sent her some, and if I mistake not we shall hear from her. We have all read of Lady Pigot's success as a Shorthorn breeder. I know a lady in Saratoga County who, without saying anything about it, is equally enthusiastic and skillful. Mark my words, Deacon, the coming farmer will be a woman."

Two years ago, J. A. W., of Center Co., Pa., wrote me that he wanted a pig to cross with his Chester-white sows. As he wanted a white breed, I recommended him to get a thorough-bred Suffolk. He did so, and now he sends me the weight of one of the pigs he killed when exactly one year old. He weighed the pig every week for the last six weeks. The smallest gain in any one week was 6 lbs., and the largest 20 lbs. His average gain during the six weeks was 11½ lbs. per week, or 1½ lb. per day.

His live weight was 386 lbs.; dressed weight, 354 lbs. This is a shrinkage of only about eight per cent.

L. R., of Tennessee, asks: "Why do you recommend wheat after oats? Why not wheat after clover? Is not the oat crop better to seed down with than wheat?"—Not in this section. Winter wheat is the best crop we have to seed with. Barley is our best spring crop to seed with; oats the worst. I was not aware that I had "recommended" sowing wheat after oats. I rarely, if ever, adopt the practice on my own farm. True, I sow wheat after oats and peas, but oats and peas together are a different crop from oats alone.

Mr. R. adds: "I hope you will excuse me if I say that I was sorry you remarked (in Walks and Talks for May) that wheat can be grown after wheat, corn after corn, etc. Not because I think that you are not right, but because a great many will make it an excuse to drop their established rotation."—I am not afraid to tell the readers of the *American Agriculturist* the truth.

"The rotation," continues Mr. R., "which I and others have practiced here with success is: Corn; oats; clover mowing; clover pasture; wheat. The wheat stubble plowed and subsoiled in the fall, hauling manure on it during the winter, and cross plowing in the spring. Then plant corn. We can not get a stand of corn on clover sod on account of worms."—If this suits the soil and climate and enables the farmer to clean the land to the best advantage it is not a bad rotation. It affords a capital opportunity to clean the land. You can plow immediately after the wheat is harvested, or perhaps, what is better, break up the surface with a heavy four-horse cultivator. You have three or four months to clean and mellow and aerate the soil. In Tennessee, too, I suppose land can be plowed more or less in winter. At any rate it can be plowed again in the spring and got into splendid condition for corn. This system has some of the features of my "fall-fallow." I would use it as a stepping-stone to something better. I would use it to thoroughly clean the land. But as soon as I got my farm clean I would sow clover with the wheat; mow it or pasture it one year and plow it up the next spring for corn. The worms would not be likely to give much trouble on a year-old clover sod, turned over immediately before planting. After corn, follow with oats or barley and seed down again. Mow the clover for hay and for seed the first year. Pasture the next spring; plow up in June or July; and sow wheat in the fall and seed down again.

I have a field I am going to serve in this way this year. It is a two-year-old clover sod. Was mown for hay and for seed last year and again for hay this year. As soon as the hay is off I propose to plow it carefully with three horses, and then roll and harrow, and afterwards keep the surface clean by the frequent use of the cultivator, harrows, and roller until the first week in September. Then sow on a barrel of refuse salt to the acre. Then drill in $1\frac{1}{2}$ to 2 bushels of Diehl wheat per acre, sowing at the same time in the drills with the seed 150 lbs. of superphosphate and 100 lbs. nitrate of soda. In the spring, seed down with a peck of clover seed per acre and 100 lbs. nitrate of soda and 100 lbs. plaster.

J. D. W., of St. Croix Co., Wis., wants to know how to use straw to the best advantage. "I purchased the farm last year," he writes,

"and there is in the stock-yard an accumulation of straw from the last ten years in all stages of decomposition, from pure muck to solid straw stacks. There is probably 500 loads. Which is the cheaper, to haul manure from town, $3\frac{1}{2}$ miles, where I can get it for nothing, or to attempt to make manure out of straw? I hate to burn the straw, as my neighbors do, but if I keep on as my predecessor did my farm will be all straw stacks."—I do not think I am capable of giving good advice on this subject. Thirty years ago or less, farmers in this section threshed their wheat in the field and afterwards burned their straw to get rid of it. This spring I saw the poorest kind of poor straw sold in the Rochester market for \$18 per ton.

"What of that," said the Deacon, "it would not have paid us to keep our straw until now."—Of course not, but it would have paid us to keep up the fertility of our land.

"But you are always saying that straw makes poor manure."—So it does when used alone. But in connection with clover hay, corn, bran, peas, and oats it can be used to great advantage. The most difficult thing I have to contend with in keeping so many pigs is to get straw enough for bedding. I could use four times as much as I grow. If J. D. W. will keep more stock, raise more clover, and sow less wheat he will find no difficulty in using all the straw he can grow. The straw and manure now on hand I would draw out at every leisure time and spread on the grass land. At the same time I would draw as much manure as possible from the stables in the city. It will certainly pay. J. D. W. gives a list of prices. Wheat, \$1.10; timothy hay, \$12 to \$14 per ton; potatoes, \$1.00 to \$1.25 per bushel; onions, \$1.50 to \$1.75; oats, 60c.; corn, 70c. With manure for the hauling, and straw burned to get rid of it, I would pile on the manure until the land was rich enough to grow 400 bushels of potatoes, 800 bushels of onions, and 100 bushels of shelled corn per acre.

W. F., Centre Co., Pa., wants to know which is best to cross with common ewes—a Cotswold or a Leicester. If he could get a pure-bred, old-fashioned, genuine Leicester, such as Mr. Sandy, of Nottingham, used to breed twenty years ago, I think he would be better than the Cotswold. But there are now no such Leicesters. The so-called Leicesters of the present day are as large or nearly as large as the Cotswolds, and I do not know that they are in any way superior. My own opinion is that the Cotswolds are good enough. I do not want any better sheep than well-fed grade Cotswold-Merinoes.

"This is true enough for the first cross," remarked the Judge, "but after that they degenerate."—I know this is the common idea, and it is true provided you breed from cross-bred rams and ewes. But if you continue to breed to a pure-bred ram you can continue to "grade up" with very decided advantage. I have now lambs with three crosses of Cotswold, and they are very strong and healthy. I do not think it will make much difference whether W. F. uses a Cotswold or a Leicester. The important point is to get the right sort of sheep, and to get one that is pure bred.

A. S. Tipton, of Howard, Pa., asks: "Do you know of a cheap and better steamer than the Prindle?"—While I think it would be easy to make a better, I continue to use my old Prindle steamer. It is safe, simple, and convenient. I have had it changed so as to burn

coal, and it is now far more effective, as we can keep up a hotter and steadier fire with less labor.

Steel Bars for Bells.

N. H. D., Fillmore Co., Minn., wishes a substitute for bells, which are very costly. He has read that steel bars have been used in place of a peal of church bells, at very little cost, and thinks, if this is true, that steel bars might be appropriately used for school-houses and farms. We believe the substitution of bars in place of bells for use in churches to any large extent has thus far only been proposed but has not yet been made. Yet as we have seen them frequently used in place of bells in mining districts to call the miners to work, there is no doubt of their fitness for farm and school-house uses. A bar such as is used for miners' drills, of octagonal steel, an inch in thickness and six or eight feet long, is bent into the shape of a triangle and

TRIANGLE AND STRIKER.

suspended at one corner by a string or wire. When this is struck with an iron rod the vibration produces a sound which may be easily heard at a distance of a mile. The weight of such a bar is about three pounds to a foot, and the cost of Pittsburgh steel, which is equally as sonorous as the more costly English, is about fifteen cents a pound. A bar six feet long, of three-quarter inch steel, would answer for farm use; for a school-house the steel should be $1\frac{1}{2}$ inch thick, and the bar should be nine feet long. In the engraving we have shown the shape into which the bar is bent and the proper shape of the striking rod. The rod should have a wooden handle, and when not in use may be hung upon the triangle. The bar should be heated in a blacksmith's fire and bent over the horn of the anvil to the required shape. The heated portion should be allowed to cool gradually, lest it might break off at the bend when rung in very cold weather.

Getting Out Swamp Muck.

At the request of several of our subscribers we describe a method of digging muck from a swamp which can not be entirely drained, and illustrate it with two engravings. Figure 1 represents a very common kind of swamp, one in a hollow with high ground all around it, from which it receives the drainage. Many swamps of this character have a layer of shell marl beneath the peat, which, as well as the peat, is of considerable value as a fertilizer. To procure either the peat or the marl is a work of difficulty, because the soft nature of the ground forbids the use of oxen or horses until it is drained and dried to some extent. To commence to dig the muck under such circumstances we would level off a portion of the hill-side on the edge of the swamp, making a road of as easy a grade as possible to the margin. Then a boat should be constructed such as is shown at figure 2. It is of pine boards, nailed very securely to side pieces of pine plank, and has a center board to strengthen it. The

seams are calked with tow and pitch so as to make it water-tight. If made nine feet long, four feet wide, and sixteen inches deep it will float with a ton of muck. It should have a pair of runners beneath it, so that it may be

now be deepened two feet more by commencing at the place of beginning and proceeding as before. The muck may be dug from the bank of the ditch with long-handled shovels if the bottom is not dry. By and by, as the ditch is

Fig. 1.—DITCHING A SWAMP.

readily drawn upon the ground when out of the water. At each side there should be a hook or eye to which a chain may be fastened. A strong eye should also be fastened on one side and at the bottom, into which the chain hook may be placed when wanted. All these are

and taking the supply of peat or marl from it, the water may be collected there and the swamp in a measure drained. When the boat is to be unloaded it may be drawn to the place where the muck is piled to dry; the hook of the draft chain is placed in the eye at the side,

Fig. 2.—BOAT FOR GETTING OUT MUCK.

shown in the engraving. To commence the digging, the boat is hauled up to the edge of the swamp and loaded with muck, which is drawn to the place where it is to be piled. The heap should be as close to the swamp as possible, as, being so full of water, much labor is saved by hauling the muck home after it has dried for a few months. As the muck is dug

They are made, as shown in figure 3, of half-inch boards in strips 2½ or 3 inches broad for the bottom pieces and narrower ones for the two side pieces. A strap of leather passes across the toe of the boot and another buckles like the strap of a skate across the instep. With these one may stand or work upon very soft mud without sinking in it. In walking with these "pattens" it is necessary to carry the feet

Fig. 3.—MUD PATTEN.

out, planks are laid down and pegged to the ground for a tramway, to enable the boat to be easily pushed into the swamp, which should be done by means of a hand-spike. By and by the muck will have been dug away sufficiently to allow the boat to float. Then the ditch is lengthened out until it is carried across the swamp. When the boat is loaded it is poled towards the landing-place with the hand-spike. If the ditch has been dug two feet deep it may

be deepened, the water will flow into the deep part and leave the shallow portion dry enough to work in. When one ditch is completed another may be dug, and in this manner a very wet swamp may be rendered dry enough for a meadow. The marl from the bottoms of the ditches will make an excellent dressing for the surface of the swamp as soon as it is drained. By excavating a pond in the lowest portion of the swamp

and the oxen or horses can easily upset it and dump the load. By reversing this method the boat is restored to its original position. A pair of mud "pattens" will be found very useful when working in the swamp.

They are made, as shown in figure 3, of half-inch boards in strips 2½ or 3 inches broad for the bottom pieces and narrower ones for the two side pieces. A strap of leather passes across the toe of the boot and another buckles like the strap of a skate across the instep. With these one may stand or work upon very soft mud without sinking in it. In walking with these "pattens" it is necessary to carry the feet wide apart, or a closer acquaintance with the mud may be made than would be agreeable. The value of muck alone as a fertilizer is apt to be overrated. We can not agree with Dana in his "Muck Manual," that a mixture of muck, salt, and lime is equal to barn-yard manure. This compost lacks some of the most valuable constituents of well-saved stable manure. But as a basis for a manure pile, or as an absorbent in place of straw, we have found it to be very valuable, and the ease with which it is spread in the field is one of its great advantages. With a plentiful supply of muck on hand one may use all his straw for feed, and thus greatly extend his resources.

An Improved Ox-Yoke.

J. S., Philippi, Jefferson Co., Pa., sends us two drawings of an ox-yoke, which we have

had engraved. He says this pattern, although very similar to that described in the *Agriculturist* of February, 1873, is better than that in some important points. The ends of the yoke are stronger, and less liable to split when made from this pattern than from the other, and

Fig. 1.—TOP VIEW OF YOKE.

neater in appearance. The bows are also better supported. This yoke is made from a block 8 x 10 inches thick, and preferably of basswood, cherry, or butternut, when used for light work, but where heavy work such as lumbering is done, soft maple should be used. The length of the yoke of which this is the pattern was five

Fig. 2.—SIDE VIEW OF YOKE.

feet two inches, but the length will vary according to circumstances. The distance between the bow-holes at the top is eight inches, but for light oxen the holes should be made to suit the bows, and the bows should be made to fit each ox just as a collar is made to fit a horse. When making a yoke, it is best to cut out a piece of board the exact shape of the pattern shown at figure 1 and lay it on the block to mark out by. The dotted lines show the amount of the chamfer upon the edges of the yoke. The portion between the bow-holes should be rounded off to very much the shape of the ball of the thumb, which is the most suitable to fit the neck of the ox.

A Prairie Stable.

A "New Subscriber" writes us from Platt Co., Nebraska, and although he does not live in a sod house, he compliments us upon our representation of one. He, however, has a sod barn, and wants to know how he may thatch it with long prairie grass. Very opportunely we have a communication from another of our friends upon the Nebraska prairies, describing his plan of building a sod barn, which

Fig. 1.—POSTS FOR PRAIRIE STABLE.

we here give with illustrations. His plan is as follows: Set four rows of heavy posts in the form shown at figure 1. For a stable 20 x 30 feet, five posts are set about 8 feet apart in each row. The first row, *a*, is 7½ feet from the next row, *b*; from *b* to *c* is 5 feet, and from *c* to *d* is 7½ feet. The outside rows should be 6 feet high in the clear, the inside rows 7½ feet. The posts are then joined at the top, lengthwise of the building, by strong plates. These may be laid in natural forked timbers or be firmly pinned to the posts. Rails are then laid about two inches apart upon the plates. Extra

posts are now placed at *e* and *f* for door-posts, and at *g* two posts are placed meeting together at the top like a letter V inverted, and as wide apart at the bottom as may be needed for the door of the cellar. The frame is now finished,

Fig. 2.—FRAME OF STABLE.

and is shown at figure 2. Then a piece of tough low prairie sod is broken, and the furrow slices are chopped with an ax into pieces twice as long as wide. The perfect sods only are laid up outside of the frame into a wall as thick as the length of the pieces of sod; the joints are broken carefully, and all spaces are filled with

appearance. To fit up the inside, rails or boards are fastened to the rows of posts, *b* and *c*, which make an alley-way or feed manger, and a space is left between them so that the animals can put their heads through into the alley to feed.

The cellar is then dug out, steps being dug in the earth for the entrance at *g*. The roof is supported by posts the same as that of the stable, and is covered with hay, then with earth, then again with hay and the earth that was thrown out of the cellar, until it is frost-proof. Shutes may be made at the sides of the cellar by which potatoes or roots may be unloaded directly from the wagon into bins. The entrance, *g*, should be covered with a trap-door. The stable should stand east and west if upon an open prairie without shelter, and hay should be stacked upon the north and south of the west door. The door opening into the feeding alley is at *h*. Sodds cut in the summer or fall are more durable than if cut at other seasons. Figure 3 shows the stable with cellar complete.

Fig. 3.—STABLE FINISHED.

small pieces of sod. Where windows are wanted, the frames are put in at five feet from the ground, as the wall is built up, and closely sodded around. The walls are built up closely to the roof of rails. A thick coating of prairie hay is laid upon the rails and covered with sods closely fitted together. This again is covered with several loads of coarse prairie hay fastened down with hay ropes or poles. The doors are hung upon wooden hinges, wooden latches are fitted, and all the crevices are tightly packed

over it, leaving a few inches of the first row only to the weather. As the second row is laid it should be beaten down with a wooden paddle to compact it closely. To make a good job there should be at least six inches or more in thickness of hay laid upon the roof.

Draft Irons for Plows.

One of the most important points in plowing is to have the draft exactly right. There are many things which may interfere with the draft of a plow to make it take too much or too little land, or cause it to run into the ground too much or not enough. A proficient plowman may be able to regulate this by altering the traces or otherwise adjusting the harness, but sometimes even this can not be done when the ordinary clevis is used. We give two illustrations of improved draft irons, by the use of which the draft may be regulated with great exactness. Fig. 1 shows one of these irons. It has a horizontal curved bar which is attached to the beam; this is pierced with holes about an inch apart. A vertical draw-plate is also fixed to the beam by means of a pair of straps

and a bolt, as shown in the figure. The draw-plate swings to one side or the other, as may be required to regulate the side draft, and is fixed in the place in which it is to be used by a bolt and nut or a pin and key. The vertical draft is regulated by a series of holes in the draw-plate. Fig. 2 shows a variation of the same principle, in which the position of the bar and draw-plate is reversed—the bar being vertical and the draw-plate horizontal. After having tested both of these we are not able to give a preference to one over the other, and it is a matter of taste or convenience as to which is the more desirable. Probably that shown in figure 1 will be the most frequently chosen.

Fig. 1.—DRAFT IRON.

Fig. 2.—DRAFT IRON.

To Build a Chimney.

A correspondent writes us that his chimney "refuses to draw," and the smoke, instead of going up, curls downwards and pours out into the room for some time after a fire is built in the fire-place. The chimney is one of the old-fashioned ones, of large capacity, and that such a chimney should so behave is what surprises our correspondent. But this is just such a chimney as might be expected to do this. The fault is in having a throat of too great capacity. When a fire is made in the fire-place of such a chimney a current of heated air and smoke endeavors to pass upwards. But in its passage it encounters a current of cold air passing downwards to fill the space vacated by the upward current. These counter currents mingle to some extent, and where they mingle curls and eddies are formed. The smoke is entangled in some of these eddies of cold air, and falls with them to the bottom and pours out into the room. If a current of air could be directed towards the fire-place from some part of the room sufficient to overcome this downward current the fault would be cured; but it is seldom that this can be done, and to get relief a radical change needs to be made in the chimney. The back of the fire-place needs to be drawn in, instead of being carried up straight, until the passage for the smoke is contracted to a few inches in width, as shown in the accompanying figure. As soon as the contraction is made the chimney is again widened to its full width. Then the warm current escaping from the throat passes upwards, and the counter current reaching the throat is deflected into the heated stream (as shown by the arrows), which carries it upwards with it, and so prevents it from reaching the fire-place and causing it to "smoke." In building a chimney this should

CHIMNEY.

Fig. 4.—THATCHING ROOF.

with sod or hay. If wild cucumber-vines, hops, or other climbing plants are planted around the stable the building will be covered with a mass of verdure which will greatly add to its

be carefully attended to, and of several which we have built in this manner we never had one that smoked at the wrong place.

The Cure of Alkali Lands.

Upon the plains in our new territories on both sides of the Rocky Mountains, there are vast tracts of alkaline soils so much impregnated that they yield nothing but sage brush and grease wood, or are entirely barren. If cultivation is attempted, a white crust soon forms upon the surface, and all cultivated plants die. There are millions of acres of these lands rich in all the elements of plant food, but made worthless by the superabundance of alkali. It has been generally supposed that these lands could never be made productive. The settlers of Utah have been entirely successful in treating these lands, and have done a good work for the nation in demonstrating their great value. We some months ago visited the farm of A. P. Rockwood in the Jordan valley, and saw meadows with a thick heavy sod, yielding three tons of hay to the acre, that were once entirely barren. We also saw upon a neighboring farm wheat fields that would turn fifty bushels to the acre reclaimed by the same process. This matter has attracted the attention of the British Government, as they have large areas of similar lands in India, that they have never been able to make productive. The Desert Agricultural Society have given to the public the best methods of their farmers in reclaiming these alkaline soils. The secret of their success lies in a process of leaching the surface of the soil, more or less prolonged according to the quantity of alkali the soil contains. The field to be treated, of any convenient size, is first surrounded with a ditch about three feet deep, to carry off any water that may be run upon it at the upper edge. It is then laid off into strips about two rods wide by deep furrows running across the slope. The upper side of the furrow is ridged high enough to make a shallow pond covering the whole surface of the strip. The next breadth of the meadow is prepared in the same way, and so on until the whole is finished. Water is then taken from the irrigating ditch and turned into the upper basin, and this communicates with the lower basins until all are flooded. The water is allowed to stand for a few days in these shallow pools, when a frothy scum rises to the surface. It is then drawn off, carrying the scum with it into the outside ditch. As this large ditch is lower than the surface, the water charged with alkali is all the while draining off through the soil. The water is kept running over this land summer and winter, for one or more years, according to its character. In some obstinate cases it is kept in the leach four or five years, before it will bear good crops. In others a single season will subdue it. The best crops for the first season after treatment are found to be castor beans, cotton, summer squash, melons, onions, and lucern. A few inches of sand spread over the surface is thought to have a beneficial influence, facilitating the germination of seed, and preventing the formation of crust. It is agreed by all parties who have reclaimed these soils that they are the most productive lands in the territory, bearing successive years of cropping without any apparent diminution of yield. In some parts of the territory they have succeeded in reclaiming these lands without irrigation, but this is where there

is more rain-fall than in the Jordan valley, and probably where there is less alkali in the soil. A. K. Thurber, of Spanish Fork City, mentions a tract in his vicinity formerly worthless but now used as an inclosed pasture, and producing good feed. He attributes the great improvement in its character "to the increased rain-fall of late years, and partly to the mixing of the grass with the earth through the tramping of cattle, and its becoming thereby decomposed." There is no doubt a large increase in the rain-fall in Utah, and this alone in some cases, has made the land productive. To facilitate the action of the rain the land is plowed up and down the slope that the water may run off freely upon the surface. The land is flowed frequently, and the particles undergo a change as they come in contact with the atmosphere, sun, rain, and frost. There are large tracts of these reclaimed lands in the territory yielding magnificent crops, and fine gardens and orchards loaded with fruit.

Grading Grain in New York.

The past gradual growth of the export trade in grain and its probable continued development in even greater ratio in the future, has necessitated a change in the method of handling the immense quantities yearly arriving at the port of New York, so that it may be transferred to ships with greater economy. Various propositions have been discussed, and vast warehouses and elevators, in which grain may be stored and to which ships may be brought to receive cargoes, have been contemplated, and a bill known as the Gardiner Warehouse bill was introduced into the legislature of New York for the purpose of authorizing their construction. Many serious objections, however, existed to this gigantic plan, both on the score of expense and convenience, and a very simple and inexpensive mode of storage of grain while it is awaiting shipping, has been proposed in its place by the merchants of the Produce Exchange. By this plan the grain will be stored upon the boats in which it arrives, or into which it will be transferred from the cars. The grain will be graded upon its arrival, and receipts given for it which will guarantee to deliver not the identical grain but the same quantity and grade which has been received. The identity of the grain received will, of course, be lost, but by the method of grading proposed, it will be in the same position exactly as so many dollar bills paid into a bank; while the same bills can never be drawn out again, yet an equal number of similar value may be procured on presenting a check. The warehouse receipt will take the place of the check, and will be a negotiable paper which can be sold or bought or transferred by indorsement, calling for so many bushels of grain of such a grade. We can not see that this plan is different in any way from the warehousing system in Chicago or Milwaukee, excepting that the grain is stored in boats, and is therefore much more cheaply stored than in costly elevators, and will be much more cheaply transferred to the ships or steamers than in any other way. Every dollar thus saved, of course, comes finally to the farmer who raises the grain or to the consumer who eats it.

NEED FOR PROTECTION.—The old adage that "shelter is feed," is well exemplified by the following statement of what occurred in

southern Kansas during last winter. The quantity of Texan stock wintered in that district was greater than ever before. Feed was plentiful under ordinary circumstances; but the winter was open with frequent long-continued rains, and the cattle utterly without shelter and chilled to the bone refused to feed or trampled their fodder into the mud and wasted it. Strong three-year-old steers lay down in the mud and never rose again. Out of one herd of 127 head only one was left alive. Many large herds lost 20 per cent, one herd of 140 lost 80, and green Texan stock, less hardy than the acclimated cattle, suffered more than others. The rudest shelter would have saved these cattle. With dry coats they will stand even unusual cold, but a cold rain quickly subdues them. The losses of last winter would have paid for substantial shelters which would last many years, and prairie sods and coarse hay, with a few poles, would cheaply furnish such shelters. We have frequently spoken of the necessity for shelters for cattle on the plains, and the moral is so pointedly enforced in this case, that it is to be hoped it will be heeded even now, while there is ample time to make every preparation for the needs of the coming winter. We have heard of cattle being "in lifts" even in the Eastern states the past spring, and this means simply exposure and starvation. Humanity to our stock is a virtue, and a virtue which is its own reward in a pecuniary sense as well as every other way.

Sheep as a Cleansing Crop.

How to clear our pastures of brush and weeds is a very important question in all our grazing districts. As a matter of fact, upon most dairy farms it requires the utmost vigilance and considerable expense annually in cutting brush to keep them clean. The grazing of cows and young cattle alone will not clean the land from brush and weeds. Patches of briars, whortleberry, sweet fern, hazel-nuts, scrub-oak, or other brush spring up, and spread year by year until the grass is crowded out, and the land is covered with a young growth of forest-trees. In many of the older states there are large tracts of land now covered with timber, that forty years ago were in pasture. In the case of rough, hilly land that can never be plowed, this return to forest is often desirable. But a certain portion of every farm is needed for pasture, and if animals can be substituted for human labor in killing brush and weeds, it is exceedingly desirable to know it. We recently visited two farms lying side by side, with no perceptible difference in the quality or moisture of the soil. The pasture lands were only separated by a stone fence, but something much broader than a fence line had separated the management of the two farmers. The one pasture had been grazed by cattle for a long term of years, and the policy had gone to seed in a magnificent growth of alders, whortleberry brush, young maples, vervain, thistles and golden rod, briars and other brush and weeds. There were patches of grass in perhaps one quarter of the field, where the cows got a scanty living. The other pasture, in addition to its cattle, had the constant tread of a flock of one hundred and sixty sheep, and their hoofs in this case certainly had been gold. Besides all the wool, mutton, and lambs sold from the flock, they had paid for their keep every year in free-

ing the pasture of brush and coarse weeds, and in enriching it with their manure. There was no brush of any considerable size, and very few weeds. And we learned from the proprietor that sheep were the only agents employed in keeping the field clean. They had nibbled the young shoots every year as they started, and what they had not killed outright by this cropping they had kept even with the grass. There was good feed in every part of this pasture, even late in the fall, and the owner of this farm used this contrast between these adjoining pastures as a standing argument in favor of sheep husbandry. It was very much to the point. If it is true, as George Geddes asserts, that sheep in certain proportion to cattle pay their way in a pasture naturally clean, they must pay much better in pastures inclined to produce brush and weeds. We have had occasion to notice the beneficial effects of the grazing of sheep upon another farm that has been under observation several years. They have not only subdued sweet fern, briars, and thistles, but have greatly improved the grasses. The sod is much thicker and heavier, and the white clover has come in where once it made no show at all. In pastures where the brush is already strong, and higher than the sheep can reach, it can not be expected that they will conquer. But if the brush be cut for a season or two, and the sheep turned in sufficient numbers upon the young growth, they will keep it under and eventually destroy it. This is much cheaper than the use of the scythe and plow perpetually.

Sale of Shorthorns.

The popularity of Shorthorn stock is well sustained. Although we can not expect to see the excitement which attended the sale of Mr. Campbell's Duchesses repeated within a generation, yet the recent sale of Mr. Coffin's herd at Muirkirk, near Baltimore, shows that, as a matter of mere business, a sale of excellent stock will attract buyers from all parts of the country, and that good stock retains its full value. The herd consisted of forty-two cows and heifers and twelve bulls, which were descended from the best families of both the Booth and Bates' strains. The average of the sale was \$640 per head. \$1,425 was the highest price paid for a cow, Muirkirk Gwynne, a three-year old roan, which goes to Kentucky, as do also eleven others of the best animals. The sale of part of the Glen Flora herd at Waukegan, Ill., on May 20th, was also well attended. Seventy-eight head were disposed of for \$55,000. The highest price for a cow, \$2,500, was paid by Mrs. Dunlop, of Jacksonville, for Jubilee Gwynne. Eight cows of this favorite family of the Gwynnes brought \$3,300. The average price per cow at this sale was \$900. Mr. C. C. Parks, the owner of the Glen Flora herd, still retains sixty head of the choicest animals. At the sale of General Meredith's stock at Cambridge city, Indiana, on May 22d, fifty head brought \$25,000. The highest price paid for cows was \$2,000, by T. C. Jones, of Delaware, Ohio, for Royal Duchess, and Avery and Murphy, of Detroit, Mich., for Joan of Arc.

On May 21st, the Lyndale herd of Mr. W. S. King, of Minneapolis, Minn., was disposed of. There were fifty-eight cows and heifers and twenty-one bulls, sold for a total amount of \$101,615 for the cows and heifers, and

\$25,375 for the bulls. The average prices were thus \$1,752 and \$1,200 respectively. The highest prices were for a pair of twin heifers, Lady Mary 7th and 8th, \$11,000, and for a bull, 2d Duke of Hillhurst, \$14,000. This last price is the highest ever yet paid for a bull; and thus those who fancied that the prices paid at Mr. Campbell's sale would never again be reached, have proved to be mistaken. Indeed, considering the well-deserved popularity of the best families of Shorthorns, and the high excellence and intrinsic value of this class of stock generally, it is unsafe to predict that present prices may not be far outreached in the future.

HERD-BOOKS.—Of making many herd-books there is no end. For every breed of horned stock we have a herd-book, and the fact that this is necessary only goes to show that stock-breeders are very much like others, herd-books being neither more nor less than a method of guaranteeing the purchaser, to some extent, against imposition. But when herd-books for swine, for sheep, and now for poultry are proposed, it is time to ask for what good purpose are they needed. For cattle, which do not very rapidly increase, and whose identity is easily determined, it is desirable to have the safeguard of a herd-book, provided it be only thoroughly well and honestly managed. But for animals which reproduce so rapidly and the identity of which it is so impossible to preserve as that of pigs, sheep, or fowls, herd-books seem to us not only useless but impracticable and absurd.

Roads and Road-Making.

It has been said that the civilization of a people is measured by the condition of their roads. If we should judge ourselves by this test, at least so far as our wagon roads are concerned, we must admit that we are somewhat behind the general standard of civilization. But the prevalence of railroads has greatly diminished the importance of other roads, and made them but secondary means of communication instead of primary ones, as they formerly were. Nevertheless we can not ignore the fact that the usual bad condition of our country wagon roads is a serious tax upon the agricultural interest. A badly-made road is expensive to keep in repair, and one which costs only \$1,000 a mile to construct at the outset will have cost in the course of ten years a sum which would have paid for an excellent road upon which very few repairs would have been necessary. Again, a bad road, built for \$1,000 a mile, is more costly to use than one on which three or four times as much has been expended in making it, because a farmer who draws loads to market upon the one can only carry a third or a quarter as much as upon the other, and to move this reduced load requires double the time that the larger load would on a good road. There is hardly a question that any community can better afford to build a level, solid, smooth, stone road at a cost of \$6,000 or \$8,000 a mile, and maintain it in good order at a merely nominal annual cost for forty or fifty years, than to build an uneven, rough, soft, earth road at a cost of \$1,000 a mile, and keep it in barely passable condition for the same number of years at the necessary high annual cost. This leaves out of calculation the loss of time, team power, and wear of wagons,

horse-shoes, and harness which is inflicted upon every traveler who uses the road.

All this shows the importance of laying out roads of easy grades, and passing around hills instead of over them, and of making the surface hard, smooth, and durable. Probably one of the best county roads in the country is one now in course of building by the Telford Pavement Company of Orange, N. J. Some time ago we had an opportunity of inspecting this method of road-making, and here describe it, with the machinery used both in preparing the material and finishing the road-bed. The road-bed is first excavated, graded, and properly formed to a depth of fourteen inches from the level of the gutters; this cross section is made to conform in every respect to the cross section of the pavement when finished. It is then thoroughly and repeatedly rolled with the steam roller, all depressions which may appear being carefully filled and rolled before the stone is put on. On the road-bed thus formed and consolidated a bottom course or layer of stones of an average depth of eight inches is set by hand, in the form of a close, firm pavement, and thoroughly rammed or settled in place with sledge-hammers, all irregularities of surface being broken off and the interstices carefully wedged with pieces of stone. An intermediate layer of broken stone, of a size not exceeding three inches in diameter, is then evenly spread thereon, to the depth of four inches, and thoroughly rolled, after which a half an inch of sand is applied and rolled in. The surface layer of broken stone, of a size not exceeding two and a half inches in diameter, is then put on to a depth of four inches, thoroughly rolled, and a half an inch of sand applied and rolled in as before. Care is taken to so spread the stones that the total depth when finished shall be uniformly not less than fourteen inches, and that the grade and cross section of the pavement may be perfect when thoroughly consolidated. A binding composed of clean sharp sand, or of the screenings of the broken stone, is then applied, well saturated with water, and thoroughly and repeatedly rolled with the steam roller until the surface becomes firm, compact, and smooth, when all superfluous binding material is swept off and removed.

The steam roller weighs not less than fifteen gross tons, and is so constructed that its compressive force on the roadway being rolled shall not be less than 450 lbs. per inch run.

The cost of a road thus prepared is \$1.00 per square yard for nine inches in depth of stone, and \$1.50 per square yard for twelve inches in depth. A road five yards wide, of the former description, would thus cost \$8,800 per mile. A road like this would be of such a permanent character as to require very little repair for many years, and could be kept in good order at a very small annual expense. In some parts of the country the citizens have already found it a measure of economy to raise money by bonds to make roads of this character, the annual saving in cost of repairs being sufficient to pay the interest upon and provide a sinking fund for the final payment of the bonds, when the road will practically have cost the township nothing as compared with the former poor roads.

The road material is rock. The best rock is hard trap; the next best is crystalline limestone; but the ordinary "hard-heads" or boulders, so common in many places, when broken, furnish one of the best materials. The soft

limestone common in much of the western country will make an excellent road, but will need more frequent renewal, the cost of which, however, is but a small item compared with that of the foundation. Neither is it necessary

hardest rock to fragments of the required size. The broken rock is then hauled and spread upon the road to the proper depth, when the steam roller compresses it with great force into a solid mass which binds together with great

a grade of one foot in fifteen. An engine weighing eight tons has a compressive force upon the road of 270 lbs. to an inch of bearing surface, and uses 400 lbs. of coal per day. The total cost of working is about \$6 a day,

Fig. 1.—WARING'S ROCK-DRILL.

Fig. 2.—STONE-BREAKING MACHINE.

in all cases to be at so great a cost for the preparation of the bed. A very fair road may be made without excavating the foundation, and a large portion of the cost saved. If the rock is to be blasted from a ledge, the compressed air-drill or a percussion steam-drill is used. The drill shown in figure 1 is the Waring com-

compactness. A certain portion of sand or fine stone screenings adds greatly to the binding together of the stone.

The steam roller is shown in figure 3. It is a road locomotive which has a double set of wheels, one for ordinary draft purposes, and one of greater weight and width used only for

and the cost of the engine with a set of four furrow plows for preparing the foundation or for field plowing is about \$4,000. An engine of this weight is twelve-horse actual power, and may be used for threshing or any other purpose to which a locomotive engine is suitable. This general availability renders it of

Fig. 3.—AVELING & PORTER'S ROAD LOCOMOTIVE.

pressed air-drill, which is capable of making 1,000 strokes per minute and of boring in any ordinary rock with great rapidity. In the employment of drills of this character a large amount of time and labor is saved. The rock is broken by a Blake stone-crusher, which powerful machine (shown in figure 2) reduces the

rolling and compressing the road. It is made by the Messrs. Aveling & Porter, of Rochester, England, but is imported and sold by their agent in this country, where it is already in somewhat extensive use. One of these engines has drawn eleven two-horse wagons loaded with stone upon an ordinary country road up

such service that its cost is within the means of almost any township in the country or of any agricultural association. Some of our agricultural societies could, by putting these machines in use, help to solve the question of the usefulness of steam cultivation, and also that of how we can have durable roads.

Long Moss—*Tillandsia*.

To the traveler in the Southern States no natural object is likely to be more striking than the Long Moss, which from North Carolina to Texas drapes the trees of all kinds, but is especially abundant upon those which grow in damp situations. This moss is sometimes found only here and there in small tufts, but frequently it is in such quantities upon a tree as to appear to fill all the spaces between its branches, and from the lower limbs it hangs in pendent tufts several feet in length, which as they are swayed by the wind wave with a certain grace. In localities where the moss is very abundant, its dull gray color and general drooping habit produce a very somber effect. As it grows most luxuriantly in situations which from being constantly moist are unhealthy, it is easy to associate it with disease and death, and in some localities it bears the not very cheerful name of "Coffin Fringe." Though popularly called moss, it does not belong to the proper mosses at all, but, strange as it may seem, to the Pineapple Family, the *Bromeliaceae*. Its botanical name is *Tillandsia usneoides*. The genus was named in honor of a Russian professor, Tillands, and its specific name means, resembling *Usnea*, a long drooping lichen which hangs from Northern trees in a similar manner. Including this there are eight species of *Tillandsia* in the United States, this being the only slender pendulous one; some of the others have broad, pineapple-like leaves, two feet or more long, with their bases dilated so as to hold water. All the *Tillandsias* are epiphytes—*i. e.*, they grow upon other plants, mostly upon the branches and trunks of trees, but they are not parasites, as they desire no nutriment from the plant to which they are attached; this merely serves them as a resting-place, and they are nourished entirely by what the air and the rains bring to them. Some of the South American and West Indian species are valued as ornamental hot-house plants, and are usually grown in pots of sphagnum, a condition which approaches nearly to their natural one. Indeed, our Southern species are some of them quite handsome, especially *T. bracteata*, the bright red stems of which bear small purple flowers. The species under consideration, *T. usneoides*, is, as just stated, of a very different habit from the others; its long, branching stems are so slender as to be almost thread-like.

Several years ago we wished, in answer to some questions, to give a figure of this plant. Having herbarium specimens, we supposed that with these and the aid of an engraving of the flower we could easily present an illustration of it; but much to our surprise we discovered that the only engraving of this very common and useful plant was to be found in a work published in Paris in 1823—and not accessible. We then attempted to procure living materials for an engraving, and wrote to several correspondents in the Southern States to send us the plant *in flower*. We received abundant specimens with the remains of seed-pods, which were no doubt mistaken for flowers, but only this spring have we been able to procure the flower. Our correspondent, Dr. H. G. Mangren, of Volusia Co., Fla., sent us flowering specimens, and though the flowers he packed all faded, an abundance of others opened when the plant was placed in the greenhouse, and we are thus enabled to give an engraving of the plant

in flower. We mention these matters to show the difficulties which sometimes attend the illustration of a very common plant.

The slender stems produce leaves at intervals of about three inches, which are narrow, recurved, and from two to three inches long; from the axil of each a branch is produced,

LONG MOSS.—(*Tillandsia usneoides*.)

which may be terminated by a flower or be much prolonged to form a part of the tangled mass of stems of which each plant consists. The plant presents one peculiarity of which we find no mention in any of the descriptions: each internode, or space of the stem between two leaves, in the young stems at least, forms an open graceful spiral of about two turns, which adds much to the beauty of the plant, when its stems are separated and allowed to

grow singly. Both stem and leaves present a uniform gray color, which while the plant is growing has a greenish tinge; an examination with a glass shows the stem and leaves to be of a light apple green, but completely covered with small, almost transparent, overlapping scales, which give the silvery gray appearance.

The epidermis is readily separated from the central portion of the stem, which is tough, and resembles horseshair in size and appearance. The solitary flowers are borne at the ends of the branches; they have a three-parted calyx and a corolla of three petals, which, though not more than a fourth of an inch across, is exceedingly interesting from being of a bright gamboge green color. The pod is about an inch long, and splits up in such a manner that it looks very much like a withered flower; this, together with the small size and unusual color of the proper flower, has no doubt troubled unbotanical observers who have endeavored to furnish us with flowering specimens.

Aside from forming a striking feature in the landscape, the Long Moss is of no little economical importance. The central portion, exceedingly tenacious and elastic, has long been employed as a substitute for hair. The plant is found in Central and South America and the West Indies, and has been put to so many uses by the Spanish Americans that in some localities it is known as "Spanish Moss." The primitive method of procuring the fiber is to place the moss in shallow ponds exposed to the sun to rot the somewhat fleshy outer covering; it is then taken out and allowed to dry, after which a moderate beating removes the outer portion, and the fiber is left in a black, tangled mass, which but for its branching character it would be difficult to distinguish from hair. We learn that since the war several establishments have been erected for the preparation of the moss in a more rapid manner. The moss is placed in large tanks, where it undergoes maceration by heat, and after drying is beaten by machinery; this is said to afford a superior product. By itself it forms an excellent stuffing for mattresses, chairs, and the like, and is probably largely used to mix with hair; it forms a considerable article of commerce, and its domestic uses are numerous. In Texas we have seen it twisted and woven into a coarse matting to serve as a saddle blanket, and have also seen horse-collars woven of the same material. It is said to be capable of forming excellent ropes and cables, and we have recently seen a newspaper announcement of the formation of a company to manufacture these articles from the tough fibres of the Long Moss.

APPLE-TREE BORER.—We have followed this insect with a sharp wire for over thirty years, and if there is any better remedy for the creature after he has begun to throw out his chips, we have not discovered it. With a sharp-pointed knife and a bit of wire a few inches long, it is not a very difficult task to dislodge the enemy. He should be attacked as soon as he makes his appearance. Young apple-trees should be examined at least twice a year. The sooner the borers are destroyed, the smaller the wounds that will be made around the collar of the tree. Generally the worm can be reached with the point of the knife. If this can not be done, follow him with wire. As a preventive, we have found oil-cloth, or

stiff, thick paper to answer a good purpose. Remove the earth an inch or two around the collar, then bind on the cloth or paper with a string. We have seen fine, thrifty young apple-trees, worth five dollars apiece, destroyed for the want of a half hour's attention in the spring.

The European Daisy.

The Daisy is a plant so commonly referred to in English poetry and literature that it seems a great pity that it should be of difficult cultivation in this country. There are many who suppose our common Ox-eye Daisy or White-weed to be the same as the plant so frequently referred to by European writers. Two plants of the same family can hardly be more unlike than the Ox-eye Daisy (*Leucanthemum vulgare*) of our meadows and the European or English Daisy (*Bellis perennis*), which while it often appears as a weed in English lawns, is nevertheless in its cultivated forms a charming flower. In its wild state the proper Daisy has a yellow disk or center surrounded with white or pinkish ray florets, but in cultivation the disk disappears, the florets are all like those of the ray. There are two obstacles to its general cultivation in this country: our summers are too hot and our winters are too cold for it, and it, like the Polyanthus, Auricula, and similar plants, can only be successfully grown by treating it as a frame plant and giving it protection from extremes of temperature. Considerable quantities are sold in our city markets every spring, in pots, and forced into early flower. These are especially attractive to English and other Europeans, who gladly purchase a plant that reminds them of home, but their purchases, if the plants are set in the open ground, can only result in disappointment. The Daisy is readily raised from seed, which will give a portion of double flowers. The seeds should be sown in a slight heat, and the young plants potted off and kept in a shaded frame in summer, and in winter be plunged in coal-ashes in the frame and kept from severe frosts. It is easily multiplied by division of the clumps. One form of the plant, known as the "Hen and Chickens," has the flower-head surrounded by a ring of smaller heads which are produced from just beneath it. Within a few years several choice varieties have been produced, which in England play an important part in the decoration of borders in spring; there is a great variety in the size of the flowers, as well as in their colors, which range from pure white to bright crimson; besides this there are some with the foliage handsomely marked with spots, like the leaves of Aucuba, and are called *Aucubæfolia*, there being both white and red flowered kinds with marked leaves. One of the finest daisies we have ever seen was left at our office in April last by Mr. J. T. Lovett, who is with A. Hance & Sons, nurserymen and florists, Red Bank, N. J. This was received from England as "Queen Victoria," and is truly a queen among daisies. It is a strong-growing plant, and a most abundant bloomer, producing flower-heads an inch and a half across. The florets are of a bright carmine on the outside and white within; a part are completely quilled, or tubular, and others are flat, and the contrast between the two surfaces produces a pleasing variegation. If we can not enjoy the daisies as hardy border plants, there are some, such as the one referred to, eminently worthy of being cultivated for greenhouse decoration.

How to Propagate Roses from Cuttings.

BY W. F. MASSEY, CHESTERTOWN, MD.

[There is no plant that the amateur more desires to propagate than the rose, and there is none with which he more frequently fails. The majority of roses offered for sale by florists are propagated in spring from cuttings taken from potted plants which are started into growth for the purpose. Another method is to take off cuttings of ripened wood in October and set them in a frame where they will be protected from severe cold weather; by spring the majority of the cuttings will be found to be callused, if not rooted. The method given in the following article is not generally known, and will be acceptable to many. The author is of the firm of Massey & Hudson, Chestertown, Md., who make a specialty of furnishing roses at cheap rates. They this spring sent us some specimens of the stock they grow in the manner here described, and we have seen no finer and more healthy young roses from any place.—Ed.]

The best time to commence the propagation of Roses, especially the everblooming sorts, is about the last of August. The best cuttings are taken from plants which have been grown in beds under shaded glass during the summer, but if the weather is moist, and the plants out of doors are in a vigorous state of growth, as good cuttings can be procured from the open border as from plants under glass.

Prepare a bed of clean, coarse sand, not less than four inches deep, either on the benches of a greenhouse or in a cold-frame out of doors. The cuttings will do as well in the one place as the other, but if a greenhouse is available the bed will be more convenient to work at. This sand bed is then to be soaked with water, and never afterward allowed to get dry. For cuttings, select shoots not more than a week or so old. The slender, wiry shoots of the monthly roses which just begin to show a blossom bud are the best. Avoid the rank, pithy young shoots which frequently sprout from the base of the bushes; these will root, but not so readily as the more slender shoots, nor do they make so good plants. Cut off the soft tip of the shoot, and divide the remainder into cuttings of not less than two eyes. The top of the cutting should be cut at least three fourths of an inch above an eye, and the leaf at this eye should remain on; the base of the cutting should be about a half inch below the second or third eye, the leaves from which should be stripped off. If the wood buds in the axils of the leaves on the lower part of the shoot are fully developed, it is an indication that the wood at that point is too ripe to take root easily, and should not be used unless cuttings are very scarce. In short, the cuttings must not be so soft as to present no woody fiber in cutting, neither must the wood be hard; a little experience will soon indicate to a close observer the exact state which is best.

Having your cuttings all prepared and your sand bed ready, take an old knife or a piece of hoop iron and, using a lath or other straight edge as a ruler, cut a line at the end of the bed across the sand, going completely to the bottom. In this line or groove set the cuttings nearly up to the leaf at the top and about half an inch from each other in the row. Turn the leaves of the cuttings all in one direction, so as to be out of the way in setting the next row, and also to present a neat appearance. When the first row is filled, press the sand tightly to-

ward the row, and about three inches from this first make a second row and fill it in with cuttings in the same manner, turning all the leaves toward the first row. Proceed in this way until the bed is filled or your cuttings exhausted, then sprinkle the bed thoroughly with clear water. The glass over the bed must be shaded with a thick coat of whitewash, and the house or frame kept quite close. If in a cold-frame, the sashes may be slipped down an inch or so at the top during the heat of the day. The frames should slope north, and not south as usual. If the bed is in a greenhouse there should not be any ventilation given overhead; a little air from the doors or side ventilators is sufficient. If the thermometer rises during the day to 100° or over, it will not hurt if the bed is kept watered and the house moist and shady. The cuttings will be rooted sufficiently to pot in about four weeks, and the process of propagation may be continued as late as good cuttings can be had from the open ground, provided some means is at hand for heating the bed when the weather grows colder. When rooted, pot off into 2½-inch pots, using decomposed sods and woods-mold in about equal parts with a very small portion of well-rotted manure. Water thoroughly and keep shaded until they start to grow. When well established in the pots, plunge them in a cold-frame or pit for the winter and protect from freezing. In spring plant out where they are intended to flower. If wanted for sale in spring, shift them into three-inch pots in January and place them in a greenhouse where the night temperature does not exceed 50°, and by the last of April most of the everblooming sorts will show flowers and make fine plants for the market.

This method of propagation is more especially applicable to the tender varieties such as Teas, Noisettes, Bengal, and Bourbon, as the wood of these sorts is usually in the proper condition in autumn, but any roses can be rooted in the same way if shoots can be had of the proper age. During the past fall the writer has propagated thousands of Moss roses in this way, which he was enabled to do by the favorable weather which kept the plants in vigorous growth. Moss-rose cuttings should be almost as tender as the green shoot of a scarlet geranium. In this condition we never have any difficulty in rooting them. The above method can be used by almost any one, while the propagation of roses during winter and spring can only be practiced by florists who have houses adapted to the purpose.

About Pickles.

A farmer sees that a jar of pickles sells at the village store for fifty cents; he knows that he can raise the quart of cucumbers it contains for a very few cents, and estimating the cost of vinegar, bottle, and putting up at a liberal figure, he finds that there must be to some one at least thirty cents profit upon each jar that is sold. He thinks here is a chance for a profitable undertaking; he has the land and knows he can raise the cucumbers, which in his eyes is the main thing, and he writes to his agricultural paper to know all about putting up such pickles as are sold in the stores. The fact is that the cucumbers, while they are the principal thing to the consumer, are but a small part of the investment of the pickle-maker. It is probable that if one of our farmer friends who have an idea of pickle-making could have bottles, vinegar, and all other necessary materials

placed on his farm free of cost, he would make a very poor business of it; he might sell a few at the stores where he traded, but he would meet with no general sale. The person who put up the pickles he saw at the store has been for years in building up a reputation, so that his name upon an article sells it at once; then he has his factory at a commercial center from which radiate the channels through which merchandise passes out to the consumer. He has sufficient capital to allow him to carry a whole year's stock, and buildings large enough to contain it, and the sum invested in cucumbers and other vegetables to be pickled is but a small share of the whole. In this as in many other cases, it is not easy for the producer of the raw material to manufacture it for market. While we would encourage every one to do that which will make his farm more productive, we do not think that pickle-making or fruit-canning can as a general thing be made profitable on ordinary farms, on account of the capital and skilled labor required. In fact the production of the raw material, and the preparing of it as a finished product for market, are two distinct kinds of business, either of which requires the whole energies of the person who engages in it. The growing of cucumbers forms a legitimate part of a farmer's or gardener's business, and when he is within easy reach of a factory where he can deliver his cucumbers fresh, or is able to put them up in salt for the market, it is often a profitable one. Any good land will produce a crop of pickles, but the hills must be enriched with fine manure. Mark out the land about five feet each way and at the intersections spade in a shovelful of manure to mix it well with the soil. The seed is usually put in the last week in June or the first week in July. Where small pickles are in demand the Early Cluster will give the best results; if large ones are wanted, the White Spine may be sown. The Long Green Prickly, while it produces a fruit long in proportion to its thickness, is such a poor bearer that growers generally discard it. Indeed those who make a specialty of this crop raise their own seeds and are very particular in the selection of the plants to furnish them. By careful selection for a few years each grower establishes a strain which he thinks better than any other and of which he is very choice. An abundance of seed is sown in each hill to guard against accidents; although insects do not so trouble the young to the extent that they do earlier, it is well to have air-slaked lime at hand to check them in case they are destructive. The ground is to be kept clean by the use of the cultivator and hoe, and when the plants show two or three rough leaves, thin them to leave three or four of the strongest to the hill. Some growers sow round turnips at the last hoeing and thus get a double crop from the land. In case the cucumbers are supplied to a factory there should be an understanding beforehand as to sizes; the usual size is four inches, but for certain purposes they are required smaller than this. Much of the success of the crop depends upon the picking; if a vine is allowed to ripen the first fruit it sets, it will produce but little after that. There should be force enough to go over the vines every other day, and the pickers should be taught to pick not only the fruit of the required size, but everything that has grown beyond that, in order to keep the plants up to their full productiveness. The cucumbers must always be cut and never pulled, not only for the safety of the vines, but because those with stems are more salable. Picking is usually

done by women and children, who are paid by the thousand a price which varies with the locality from twenty-five to forty cents. The pickers should be careful not to tread upon the vines. The delivery at the factory may be made at such times as may be agreed upon, as if not in such large masses as to heat the cucumbers will be in good condition for several days. Those who send their pickles to market salted follow different methods. One of our friends who was formerly largely engaged during the war in supplying the southwestern markets put up his cucumbers in the following manner. New barrels were used, and one head being removed, the barrel was filled as full as possible by shaking, about half a peck of salt added and the head put in place. The barrels were then filled quite full of water through the bung-hole, and then bunged up tightly. He stated that as they were sold by the barrel and not by count, it was a profitable business for him. It is probable that in tightly closed barrels the pickles would keep for some months in this weak brine; at that time the article met with a ready sale, and our friend never heard any complaint of their spoiling. Mr. Waldo F. Brown, a well-known Ohio seed-grower, in his "Farm Quarterly" for April gives his method of salting cucumbers as follows: "Cover the bottom of your barrel with salt, then pour in a bushel of pickles, then sprinkle three or four quarts of salt, and so on till the barrel is full. In twenty-four hours you will find the barrel only two thirds full, and the brine at the top of the pickles; then fill again, and perhaps a third time, and when full put on a loose-fitting cover and a weight to keep it under brine, and nothing more is necessary except to see that the brine does not settle so as to leave them bare, in which case make strong brine and refill. Many make brine and pour over them; but by my plan nearly one third more pickles can be put in the same space, and I think the pickles are better for drawing the juice out of them, and if salt enough is used they will keep indefinitely. I have kept them over the second summer in fine condition. A forty-gallon barrel will hold about three thousand pickles, if salted as I direct, and with a little experience a man can count and pack four thousand an hour."

Ferns and Fern Collecting.

Taken as a whole, few plants present a greater variety of graceful outlines than do our native ferns. Those who go from cities for their summer vacation are quite sure to be attracted by the ferns, and as they have seen other ferns cultivated in cases and in greenhouses, they set to work to gather the roots of these to take home for the decoration of their rooms during winter. Ladies, and sometimes gentlemen too, make excursions to the hills and valleys in search of these plants; the roots are carefully placed in boxes and watered and shaded until the time for the return, and on the journey home the parcels are taken by the collector's own hand, as something too precious to be risked with the baggage. At length the plants find their place in the fernery, and are watched with much interest. They perhaps do not look very well, but that may be on account of the journey. As cool weather comes on the ferns look worse, and are given more heat. A still worse condition suggests that they should be kept cooler, or have more air, or more or less light; but with all the changes they go

backward, and by Christmas the probabilities are that not a green frond is to be seen. This want of success is ascribed to improper soil, too much or too little water, or to any cause but the right one—a want of knowledge of the plants themselves. The fact is that the great majority of our ferns are deciduous, and when taken home at the end of summer no treatment whatever will make them flourish; they have completed their career, and must have rest until the next season. These deciduous ferns, graceful and delicate as they are, will not answer for house-culture; we have a few ever-green ones, readily distinguished by the firmness and persistence of their fronds, which will do admirably; but with the exception of these, if we would fill up a fernery, we must depend upon the exotic species furnished by the florists. Still we would not discourage the collecting of native ferns, for much enjoyment may be had from their cultivation, only it must be for the most part out-doors rather than in the house. There are but few city yards that do not furnish a shady corner which will allow of a small fernery, and some stones should be arranged to form a little rock-work on which many kinds will grow that would not flourish in the border. Some ferns seem to need the protection the stones afford to their roots. Upon such a small scale no very picturesque rock-work can be achieved; the best that can be done is to imitate some rocky hill-side with crevices between the rocks which are filled with earth, which extends down to and is in connection with the soil of the border. This precaution must be observed in making a rock-work of any kind, large or small, for ferns or any other plants, for if the earth is in mere pockets it will soon dry out, and as no supply of moisture can come up from below the plants will in a dry time be sure to perish. To those fond of ferns there is every encouragement for them to attempt their cultivation in the manner here stated, and we have seen several ferneries in city yards which possessed much interest, the plants having been accumulated during successive summer excursions. In collecting ferns, it would be better to remove them in early spring, just as they are starting into vegetation. But while this is practicable to those who live in the country, those who live in cities must take them just as they are in the height of their growth or not at all. In this case, the best thing to do, after having secured a good clump of roots, is to cut away all the fronds, provided the plant is one of the large kind. If considerable time must elapse between the time of gathering the plants and that of taking them home, it will be best to set them closely together in a box in which some woods-earth has been placed. Put the plants in a shady place, and sprinkle as often as may be needed to prevent them from drying out, yet they should not be too wet at the roots. In setting the ferns out, as near an approach as possible should be made to the natural localities of the plants. Those found upon rocks should have a place on the rock-work; those that were collected along the edges of thickets and by roadsides will make themselves at home in the border; and the "Ostrich Fern," which grows in rich, moist soils, and the "Flowering Ferns," which come from the margins of swamps, may have a place to which water can be conducted to keep up the proper moisture. The great trouble the town cultivator will encounter will be the soil. Very often that in the yard is of the poorest kind, and mixed with builder's rubbish. For some species it will be absolutely

necessary to have soil that is light, and which contains a large share of vegetable matter—such as is known as woods-earth or leaf-mold. It sometimes happens that a florist will furnish a supply of soil of this kind for a moderate sum, or arrangement can be made with some

of leaves besides. The stem is terminated by usually two umbels of flowers, which have the structure peculiar to the genus. But few plants present such a striking departure from the ordinary form of the flower as do those of the Milkweeds. Wonderfully curious is the ar-

are derived from Latin and Greek, could be perplexed as every druggist is almost daily by the indefiniteness of common names, they would gladly adopt the definite botanical ones. To distinguish the Yellow-root in question from the others Dr. Gray very properly gave it

G. J. S. dec.

FOUR-LEAVED MILKWEED.—(*Asclepias quadrifolia*.)

SHRUB YELLOW-ROOT.—(*Zanthorhiza apifolia*.)

market gardener to bring in a barrel of the desired material. One who is really in earnest can procure it without great difficulty. We would advise those who collect ferns by all means to learn their name. We have seen a large collection, the result of several years' labor by a lady, who did not know the name of a single one of her ferns, and we could not help thinking how much more she would have enjoyed her pets could she call them by name. In Gray's Manual the ferns of the Northern States are carefully described by Prof. D. C. Eaton, and as one specimen of each genus is so illustrated by engravings that its characteristic parts are distinctly shown, almost any intelligent person can with a little study make out the names of the species he finds.

The Four-leaved Milkweed. (*Asclepias quadrifolia*.)

One or more species of Milkweed is to be found in almost every locality, but the commoner ones which grow along roadsides and in fence-rows have generally a coarse, weedy look. Not so the little four-leaved species of the woods, which is as delicate as the others are coarse. This has a slender stem, one to two feet high, upon which are one or two whorls of four leaves together, and one or two pairs

of the stamens, from which the pollen can only be removed by the help of insects, and singularly beautiful is the crown of cups attached to the stamens, each cup or hood looking like a minute, tinted shell, within which is a slender curved horn; this crown is often the most conspicuous part of the flower. In the present species the hoods are nearly white, delicately tinted with purple at the base. The flower appears in June, and has a most pleasing fragrance. We do not remember to have seen the Four-leaved Milkweed in cultivation; but it is worthy of trial by growers of native plants.

The Shrub Yellow-root.

It is the misfortune of common names as applied to plants that they are very apt to be used loosely. Sometimes the same name is given to widely different plants, and again a plant will have several common names, and the greatest confusion prevails among the common names of our native plants. There are five kinds of "Rattlesnake Root," three things called Checkerberry, while the plants known as "Snake-root" number a dozen or more, hence it should not surprise us to find three or four distinct plants called in different localities "Yellow-root." If those persons who hold in contempt botanical names of plants simply because they

the name of Shrub Yellow-root, and as the others bearing this name are herbs this simplifies matters greatly. The botanical name, *Zanthorhiza*, is the rendering of Yellow-root into Greek, and its specific name, *apifolia*, means parsley-leaved, as the foliage is cut up something after the style of that of "single" parsley. It belongs to the Ranunculaceae Family, and is interesting as being one of the few members of that large and important family that are shrubs. The plant has long, deep, yellow roots, from which arise several stems, sometimes as high as three feet, but more commonly from one to two. The stems have large terminal buds, from which in spring appear the many-divided leaves and the drooping racemes of small, brownish purple flowers. The general habit of the plant is given in the engraving. The plant is found in Western New York, Pennsylvania, and southward along the mountains. Both root and stem have a very yellow and bitter bark, which was found in use by the aborigines as a dye, which takes readily upon wool and silk. Some years ago it attracted attention as a medicinal plant, but its properties are only those of a simple bitter, and it is not in this respect superior to other and more common tonics or vegetable bitters, which are much alike in their effects. The coloring matter is similar to that of the barberry.

THE HOUSEHOLD.

(For other Household Items, see "Basket" pages).

A Clothes-Line Reel.

An Illinois correspondent sends us a sketch of a contrivance for taking in a clothes-line, which he has made, and, finding it to work satisfactorily, he wishes to give it to the readers of the *Agriculturist*. He justly remarks that it is a great deal of trouble to put up and take down an ordinary clothes-line, and it is often left out and exposed to the weather and soon becomes rotten. We regret that his description is not quite so full as it might be, but, as we understand it, it affords a hint to those husbands who like to make things handy for the "women folks," and give his sketches and description. In the first place, he has an upright box, to serve as a post, built of boards; this is shown at *a* in both engravings, figure 1 being a front view

Fig. 1.—FRONT. REEL. Fig. 2.—SIDE.

and figure 2 a side view in section. This box, *a*, is made large enough for the weight, *b*, to move up and down freely inside of it. Attached to this upright box, at the proper height, is a box, *c*, to contain the reel for the line. The reel is double; it has a large shaft, *d*, upon which the line is wound, and a smaller shaft, *e*, for the cord of the weight. This box is so attached to the upright one that the small shaft, *e*, is opposite to it. The weight has a pulley attached to it; the cord from the weight is fastened to the top of the upright box, goes through the pulley on the weight, over a pulley at the top, and down to the shaft, *e*, of the wheel. When this cord enters the box there is a guide pulley or roller, *f*, to make it run smoothly. When the line is put upon the reel the weight is first wound up by revolving the reel, which will wind the weight cord up upon *e*. The line being made fast to the shaft, *d*, the weight is allowed to run down, which will reel up the line upon *d*. There must be an opening in the box, *c*, the length of the shaft, *d*, in order to allow the line to run freely. When the clothes-line is pulled out, of course the weight will be wound up, and when it is to be taken in the descent of the weight will cause the line to be reeled upon its shaft and be properly housed. We give this merely as a suggestion, regretting that our correspondent did not give exact measurement, size of weight, etc., all of which are necessary in explaining such a contrivance.

French Cream-Cake.—Mrs. E. G. B.—
Sugar, 1 tea-cupful; flour, 2 tea-cupfuls; milk,

$\frac{1}{2}$ tea-cupful; eggs, 3; baking-powder, 1 tea-spoonful. Bake like jelly-cake, but have the layers thicker. When done, split open with a sharp knife and place one above another, having the crust down, with mock-cream between each layer made thus: One pint boiling milk, beat well, and stir in 2 eggs, 1 cup of sugar, 2 table-spoonfuls of corn-starch, and lastly add $\frac{1}{2}$ tea-cupful of butter. This cake is better two or three days old. It makes a very nice dessert.

The Atrocity of Feather Beds.

BY A COUNTRY PARSON.

The cackling of the goose is said to have saved Rome. The feathers of the same bird are dealing death to America. We are reminded of this as the summer approaches and the hospitality of rural friends occasionally introduces us to the "feather bed" which has come down an heirloom in the family for five generations. It is a capacious bag, holding some thirty to forty pounds of good, honest goose feathers, plucked a hundred years ago, and held in high esteem by succeeding generations until it has come into the possession of the present incumbent of the old homestead. Underneath this feather bed is the straw bed, filled annually with clean, sweet oat straw. This relieves the pressure upon the bed cords, which are annually tightened at the spring house-cleaning with the old-fashioned winch and pin until the tense cord makes music to the stroke of the hand. This feather bed was a tolerable institution in the days of log houses, with the free ventilation of a big fireplace and rifts in the roof through which the wind whistled and the snow drifted in every winter storm. But now, with tight houses and stoves that heat everything from cellar to garret, the case is altered. No amount of airing and sunlight will permanently redeem the bed from the odor of old feathers, which is anything but agreeable, and the more atrocious effete animal matter that has escaped from the sleepers that have sought repose here for generations past. Think now of John Giles coming in from his day's work in the field where he has been following the plow or driving the mower or reaper, his body all day long in a vapor bath, to repeat the process in the night watches as he stretches his weary limbs upon this unpatented perspirator. Here he tries to sleep, but wakes often from fitful dreams, and tosses as if a fever were raging in his veins. Is it any wonder that he rises from unrefreshing sleep with the early dawn, that he grows lean and cadaverous, and becomes cross and dyspeptic? The poor wife who shares his couch has possibly, in addition to his discomfords, the care of a nursing child. Is it any wonder that she comes to the morning more dead than alive? Is it any wonder that so large a per cent of the inmates of our lunatic asylums come from our farms? The old proverb that "the rest of the laboring man is sweet" needs to be received with several grains of allowance. There is not much sweetness or refreshment on this pile of feathers in the sweltering summer nights. It is surprising to see how long it takes modern improvements to invade the agricultural districts, even with the help of railroads and newspapers. Hair mattresses and spring beds are unknown luxuries in many of these districts where the civilization is at least two hundred years old. "The age of home-spun," supposed by some of our brilliant writers to have departed fifty years ago, is still continued in almost unbroken force. Something cool and soft to sleep on and under, is still a desideratum in most farm-houses. The apology for feather beds and cotton-quilted comfortables is not poverty, but convenience of manufacture. The feathers are a home product, and a tea-drinking makes the quilts and comfortables. Yet John Giles owns his farm, is out of debt, has a good bank account, owns railroad stock, and could have mattresses, fine linen, and blankets if he understood their comfort and economy. Where are our advertisers of good beds and bedding?

Home Topics.

BY FAITH ROCHESTER.

THE CONTENTS OF CHILDREN'S DINNER BASKETS.—I think I will tell a little true story, to begin with—a bit of my own early experience.

I was rather a delicate child, subject to sick headaches and to frequent fits of childish sickness—in the summer fevers, and in winter inflammation of the lungs, cold in the head, *et al.* I got the idea when quite young that I was not expected to make a very healthy woman, and that it would not be strange if I should grow up to be a chronic invalid. It did not occur to me—nor to any one else, so far as I am aware—that this would depend chiefly upon my habits of living during my early years. Though I became a church member at thirteen, I had not the least awakening of conscience in regard to physical sins (or unhealthy habits of eating, dressing, exercise, etc.) until more than five years later, and since then I seem to have been learning only slowly, with pain and difficulty.

When I was twelve years old I was a pupil at a select school more than half a mile from home, and carried my dinner in a small tin pail. I was allowed to put this up for myself, without any supervision from others. A little white "milk emptyings," bread, well spread with butter, went in for decency's sake; all the rest was pie, cake, and pickles. The cake and pickles were my chief dependence.

I used to feel secretly sure that I should soon die of heart disease! My little five-year-old Dot knows more of physiology and hygiene to-day than I did then, though I was getting on well with my algebra and grammar and history, and had just taken a prize for the best composition. I thought it was my heart that pained me so under my ribs after I had eaten the cake and pickles. One afternoon I had to go out of school crying with the pain, and the teacher's wife allowed me to lie on her bed until school was over. Then, instead of walking home, I went to stay all night with my seat-mate, who lived nearer the school. Her mother said it was dyspepsia that troubled me, and that she had it herself. I had heard the name before, and felt rather flattered at having such a respectable disease, and drank the hot tea she prescribed and prepared with an unusual feeling of being in the fashion.

Not long after I took my dinner with me and went home with my seat-mate at noon. I sat nibbling my lunch in the kitchen, where Anna's eldest sister, a young married woman home on a visit, was ironing. I always liked her. She looked into my pail, saying merrily: "I wonder what you carry for your dinner."

"I don't wonder that you have a pain in your side so much!" she exclaimed. "Don't you know that it is the pickles?"

I explained that I had dyspepsia, but she laughed, and told me that I always would have, and worse and worse, as long as I ate such lunches. She counseled me kindly to make the bulk of my dinner of bread and butter or other plain fare. This advice was acted upon in some degree, and I soon found such a connection between pickles and sick headaches and dyspeptic pains, and later between mince-pie and rich cake and the same aches and pains that prudence led me to avoid them. It was not conscience yet.

This experience, like others of the same stripe, has enabled me to realize better the wisdom of the good God in giving us pain and sickness and death as results of disobedience to physical laws. It seems strange that individuals learn the wisdom of obedience so slowly; and very strange that the human race parts with its stupidity in this respect so tardily. Yet all this may not seem slow or strange to us millions of years hence, but only a beautiful part of our Maker's great plan for our full and perfect creation. He might have created us with only instinct, like the brutes, but he gave us reason and freedom to work out our own salvation, physical as well as spiritual.

The dinners of the school children tell steadily upon their growth and welfare and future useful-

ness in the world. Like grown-up people, they use up daily, or waste by excreise of all sorts, by mere bodily combustion too in keeping the body warm with blood, a large portion of the nourishment they get from food. This daily wastage must be made good. Children have not only to repair the daily waste, but to go on building up new bone, new muscle, new brain, as they grow from day to day. Their food should contain nourishment for all parts of the system, and they should have plenty, but they should be accustomed to such plain fare that they can readily stop eating when their hunger is satisfied, and not go on nibbling merely to gratify the palate, thus forming habits of gluttony.

Cake and pastry have but little, and pickles have scarcely a particle of nourishment in them, and they almost invariably do the system positive harm, in greater or less degree, when taken into the stomach. The harm may be so little and the overcoming influences so strong, in the way of out-door exercise and other healthy conditions, that no evil result may be apparent; but all our diseases are caused by violations of hygiene in some respect. We are not always personally responsible for these violations, since our sanitary conditions are not always within our own control, never indeed entirely so; but where we can help ourselves we ought clearly to do so.

LARGE AND SMALL WASHINGS.—There is more than one way to "save washing." There is a right way and a wrong way, and each of these ways includes many details. Of course, I am writing for people of moderate means. Some housekeeping is done "regardless of expense," and regardless of everything but the personal wishes or whims of its directors. "Household" articles on domestic economy are not read or desired in such establishments. But we who have to look after the small arts of living comfortably and healthfully, and at the same time with true economy, must give earnest thought to all departments of our housekeeping.

I know a woman who always used calico night-gowns for herself and children because they would not show dirt like white ones, and could be worn a longer time without washing. But the colored gowns were as much soiled as white ones would have been. White garments can be more thoroughly cleansed, by strong suds, washing fluid, boiling, and bright sunshine, than can colored ones; so I think it a mistake to use colored night-gowns with an idea of saving washing in that way.

This does not exactly apply to the use of gingham or hickory shirts by farmers. A man who works in his shirt sleeves is likely to soil the outside of the garment so very soon that he does well, if he wishes to keep a decent appearance during the days while he must wear the same shirt, to have it made of some material that does not show spots so easily as white cotton, but of fast colors that will bear boiling.

Nor do my remarks about night-gowns apply to children's dresses and aprons. The darlings look "sweet" in white frocks, but I know so much more than I once did about the cost of those dainty garments that my admiration is by no means unmingled with distrust. The first cost may be trifling—no more cents per yard than a good gingham or delaine perhaps. But when the little roly-poly is dressed in its spotless gown and turned loose to play—Oh! But you don't turn it loose to play with white dresses on! No, and that is just the pity of it. There is where you are paying altogether too dear for your whistle. You may spend money in vain for medicines in the effort to buy for a pale and puny child the rosy cheeks and bright spirits and cheerful voice and promise of long life which you have sacrificed to its white dresses in the effort to keep them clean.

A mother may resolve that she will eat her cake and have it too—that she will keep her child in clean white dresses and not restrict his healthy rough-and-tumble exercise out of doors and on the floor. Think it over well, loving mother. How many dozen little white garments can you afford to make on your sewing machine each season? How many can you wash and iron weekly? What hours

of reading will you give in exchange for these labors of love—the sewing and the laundry work? Can you keep your child in spotless robes and yourself in the cheerful spirits that go along with unstrained nerves and a body not overworked?

Our ideas of beauty have their foundation in some perception of spiritual truth, however dim or poorly conceived. Pure and spotless robes are beautiful, and no one dreams of a heaven without them. I too long for them, and gladly believe that when the kingdom comes on earth good gowns and white robes will belong to everybody's wardrobe. But at present I would not take as a gift the wonderful white gown which my neighbor regards as a great triumph of art. It is so fearfully and wonderfully made, with its ruffles and tucks and puffs and skirt over skirt that no one but its owner can be trusted to iron it. This task takes her just one whole day, she says; and the complicated garment can be worn only a few times before it has to have a fresh washing and ironing.

Neither do I envy the hired girls their ruffled white skirts. Annie would tell me at eleven o'clock that the ironing was all done but a few pieces, and in the middle of the afternoon the kitchen fire would still be raging, while Annie's red face was bowed over the ironing-board, where her own puffs and ruffles on her white skirts were being smoothed. Plain hems for me! And white skirts only with very light colored dresses! And very light dresses only for the leisure hours, and not then if they make me fear to have the children run in from play to hug and kiss me.

Give us plenty of undergarments—separate ones for the day and for the night, so that these may be changed and cleansed as often as once a week at least. But there is a great saving in the labors of the laundry if most outer garments be made of colors and materials which can be worn a long time without showing slight spots or stains, but which can be brushed and aired in the sunshine, and sponged in the places most exposed to soiling.

Colored table-cloths save a good deal of labor, and if large oil-cloth mats or japanned paper trays be slipped under the children's plates the cloths will look clean enough to use a long time, especially if carefully folded in the same creases each time. Folded paper under the children's plates will serve in an emergency. The use of table bibs will save the children's aprons a great deal, and if these are of rubber they need not go into the wash.

What Shall we Have for Breakfast?

BY MISS J. J. O., WOODBOURNE, SULLIVAN CO., N. Y.

Being a farmer's daughter, acquainted both by observation and experience with many needs of farmers and their families, I venture sending a few hints. I esteem no one thing more essential to the success of farmers than that of having breakfast well and promptly prepared, so that they may be able to avail themselves of the early, cool morning for their own work and that of their teams. By proper forethought in making allowance for the next breakfast when cooking the dinner, the accompanying lists can be prepared by any active housekeeper in half an hour. Of course, if potatoes and meats are to be cooked, they must be made ready over-night, coffee ground, etc., to spare the vexation of uncomfortable haste in arranging the breakfast. Coffee is supposed to be served at each meal, that being our usual breakfast beverage, although chocolate, tea, or water may be substituted if desired. The kinds of meat may be varied with the season, to include fowls, fresh fish, veal, mutton, or whatever is procurable or desirable; and similar variations may be made in the fruits. It is sometimes a grateful change in midsummer to leave out meats altogether, and add more fruit, either raw or cooked. Potatoes are mentioned in the lists because it is taken for granted that every farmer has them; but those who relish other vegetables, and give them place in the garden (as every farmer should do), will often exchange them for or supple-

ment them with some of the many other healthful vegetables. No breadstuffs appear in the lists, as it is assumed that bread, buckwheat, graham, or Indian meal cakes will be served each morning according to season or preference.

It has always seemed to me that none have better opportunities for an abundance of good food than farmers, providing their wives and daughters appreciate their position as they should, and will give to the preparation of the meals the amount of thought and care that good cooking requires. I fancy that I hear some hurried, overworked housekeeper saying: "Oh! do not speak of putting out any more work or thought on cooking than we now do." Far be it from me to add to the burdens of the already over-tasked American farmer's household; but permit me to whisper a doubt of our work being always just as well systematized as it might be, and just as much pruned of extra duties. I do not purpose to carry this subject out, as it could easily be, to the extent of an entire volume or more; but I must say that it does not appear to me necessary for even independent, middle-class farmers and their families to seek the adoption of furniture, equipage, and dress indulged in by people of more wealth though less independence than farmers; every mere luxury bringing with it added care. Ah, tired house-mother! Leave the ruffles off the children's clothing, put aside the extra stitches and the extra rubs; prepare a simple, healthful, early breakfast (for starting right in the morning is a good foundation for going through the day right), and let every member of the household have a pleasant memory of the dear old farm, its quiet reunions around the breakfast-table, and a thousand other possible reminiscences of peace and beauty to take with them not only through the toils of present days, but through other years, when they may too truly become only memories to its scattered flock.

BREAKFAST LISTS.—The articles in parentheses refer to different seasons:

SUNDAY.—Baked potatoes; roast beef from previous dinner, set in the oven until hot; stewed apples (pie-plant); rice pudding.

MONDAY.—Potatoes, from previous dinner, cut in slices and heated or warmed over by dropping in hot fat, like crullers; roast pork, cold; cucumber pickles (cut cabbage); raspberries, fresh or canned.

TUESDAY.—Boiled potatoes; salt mackerel; chopped tomato pickle (lettuce); pie, apple (pie-plant or cherry).

WEDNESDAY.—Baked potatoes; broiled beef; tomatoes, canned or fresh; stewed apples (strawberries, cherries, etc.).

THURSDAY.—Codfish, *Agriculturist's* mode of cooking; boiled potatoes; cucumber pickles (martynias, etc.); canned plums (baked pears).

FRIDAY.—Broiled ham and poached eggs; apples, stewed or baked; rice pudding.

SATURDAY.—Potatoes, warmed over by slicing in just water enough to keep from burning, to which add butter and seasoning; broiled steak; chopped tomato pickle; cherries, canned or fresh (blackberries, grapes, etc.).

Pudding Sauce.—Mrs. T. H. L. says: "For the benefit of those who do not have milk in plenty, the pudding sauce mentioned in March last can be made very nice by taking the same quantities of sugar and butter, adding water instead of milk, letting it all boil together, and when boiling pour slowly on a well-beaten egg, not putting on the stove again; when nicely thickened by stirring pour into a dish on wine and nutmeg. I use this recipe often."

Lemon Custard.—By Mississippi.—Take four eggs, beat them well; add six table-spoonfuls of sugar, three of butter, half a tea-cupful of rich cream, and juice of two lemons. Beat all the ingredients well together, and pour on crusts and bake. This quantity will make three ordinary-sized custards.

BOYS & GIRLS' COLUMNS.

The Key of the Bastile.

It is likely that every boy and girl old enough to read knows that Mount Vernon is the name of the estate where Washington formerly lived; it was here that he died and was buried. This place, which is upon the Potomac River, a few miles below Washington, is visited by many persons who wish to see the place where the great general and our first President lived, and the spot where he is buried. The house is kept in very much the same condition that it was in Washington's lifetime, and

KEY OF THE BASTILE.

the rooms he occupied and the furniture he used are shown to visitors. Among the objects shown is a large key in a glass case, which was sent by Lafayette to Washington—the key of the Bastille. How many of you know what the Bastille is, or rather was? In French it is spelled with two l's, and is the general name for a fortress, but was especially applied to a large fortress in Paris, which was begun as long ago as 1639, and afterwards much enlarged. It was an immense stone building, with towers and a great ditch running all around it, and had numerous cells in the towers, as well as horrible dungeons below ground. This place was for a long time used for the keeping of state prisoners. Princes and others who were supposed to be dangerous to the government were put away here where they could do no mischief. After a while it became a common jail, and great numbers of persons suspected of being opposed to the rulers were confined here. When you read the history of France you will find that the Bastille plays an important part, and that many distinguished persons were imprisoned here, and went from it to be executed for their political belief. There is no sadder page in all history than that of which the Bastille is the center, and perhaps you will sometime read all about it, and learn how the passions and prejudices of people led them to do wicked deeds. For a long time the very name of the Bastille was a terror. During one of the French revolutions, in July, 1789, the people destroyed the famous prison; the guards made but a feeble defence, and the people rushed in, liberated the prisoners, some of whom had been there many years, and one had been confined there since he was eleven years old. The people toppled the towers down into the ditch and underground dungeons, and the whole fortress was completely destroyed. Upon the place where this famous prison formerly stood there is now a monument erected to the memory of the patriots who fell at that time, which is called the Column of July. Lafayette, who was as you know a great friend of Washington, and who was always a patriot, sent to him the key of the terrible prison, as a memento of the triumph of the people over their wicked rulers, and the key can be seen by all who visit Mount Vernon.

Mr. Crandall's Acrobats.

Mr. Crandall has probably done more to amuse young people than any other living man. Some of you who are old enough to read, and doubt whether you are to be still classed among the boys and girls, but think you are almost young men and women, can remember when his building-blocks first came. What a treasure those build-

ing-blocks were, for the things that can be made of them are numberless, and then, unlike all other blocks, the houses and other structures made of them hold together. These blocks have gone all over the country and to far-off countries; for children in Australia and South America are just like other children in wanting to be amused, and fathers and mothers everywhere wish to amuse the children, and it would surprise you to know how many far-off places have sent for the blocks. The loads upon loads that have been sent to different parts of this country, if you could see them altogether, would make a tremendous pile. But Mr. Crandall was not satisfied with his success with the blocks, and away up in his home in the mountains he has been contriving other things to amuse children; he has sent out blocks of various kinds, but at last he has hit upon something new—his Acrobats. Hurrah for the Acrobats! for they are just the funniest things ever made. But stop. What is an acrobat? That question would puzzle more than one old person, and the children might as well know that it comes from a long Greek word meaning to walk on tiptoe; it was first applied by the French to rope-dancers, and has since been used for persons who perform gymnastic feats of any kind. As Mr. Crandall's toys can be made to do almost any ridiculous thing, he has called them "Acrobats," and it is just as good a name as any other. There are four acrobats in a box, and each one consists of a body, a head, two arms, and two legs. All these parts are so grooved and notched that they can be put together to suit the child's fancy. They go together much as the blocks do, and, like them when put together, they hold. Then there are long and short grooved strips in each box, which allow the acrobats to be set up in all sorts of ways. When Mr. Crandall sent his first sample box, you ought to have seen how a lot of old "boys" amused themselves with it. Men who are grandfathers took the greatest delight in putting these figures together in strange shapes, and then laughing at them just as children would. Well, that is right; a man should never forget that he was a child once, and probably each one was laughing to think how his children would be pleased. Did not the figures illustrating these Acrobats take up so much room we would show them here, but the publishers, who have the sale of this, the best toy of the century, give the whole thing in the advertising pages, and we advise you to turn to them and learn more about these funny acrobats from the engravings than a long description could tell. We think the boys and girls should hold Mr. Crandall in their esteem as only next to St. Nicholas.

Sunrise.—Bas-relief.

In our mention of the picture called "Sunrise," given last month, we just had room at the bottom of the page to say that it was from a "beautiful bas-relief," and promise to tell more about it. Probably some were puzzled to know what a bas-relief was, and others must have wondered why the little girl had such strange eyes. Yet perhaps the eyes, if nothing else, led them to think that the picture was copied from a piece of sculpture in marble. This was really the case. One of our artists saw this marble work, and being pleased with it he made a copy of it. Besides the figures which stand by themselves, such as the statues and busts, sculptors make works in which the figures are attached to a background of marble or other material. These are called works in relief, or *relievo*, as the Italians call it. In high relief the figures are only attached to the background here and there, and are in places quite free from it; in half relief, the figures project half-way from the background; and in low relief the figures stand out but a little way—less than half. The word for this in French is *bas-relief* (pronounced ba-relief), and is perhaps more generally used than the English *bas-relief*.

Bad Writers.

A great many stories are told about the mistakes of printers, and there are some ridiculous ones that may happen by the use of a wrong letter, but the printers would not make so many blunders if those who wrote for them wrote more plainly. Many noted writers have been celebrated for their horrid hand. The bad writing of the eminent lawyer, Rufus Choate, has often been mentioned as the worst possible; some one said that the word "what" as he wrote it, "looked like a small grid-iron struck by lightning." One of the widely read English journals not long ago had an article on "Wretched Writers," which was mainly devoted to showing the mistakes made by Horace Greeley, as if there were not abundant examples of bad writing in England. It is true that Mr. Greeley would never have succeeded as a writing-master. We have several pieces of his writing which are not so difficult to make out when one gets the hang of it and knows that he made *s*, *a* and *r* all alike, as he did *b*, *p* and *h*. This English journal gives an instance of his bad writing that we had not seen be-

fore. Mr. Greeley was invited to attend a press meeting in a Western state, and sent a letter declining to come. Those who invited him studied over his answer, and this is what they made out of it: "I have hominy, earrots and railroad ties more than I could move with eight steers. If eels are blighted, dig them early. Any insinuation that brick ovens are dangerous to hams gives me the horrors." What he did write was: "I find so many cares and duties pressing on me, that, with the weight of years, I feel obliged to decline any invitation that takes me over a day's journey from home."

It does not seem possible for every one to learn to write an elegant hand, but it is possible for every boy and girl to write a plain hand that can be read without difficulty. The most troublesome letters that come to this office are those of persons who use flourishes, and though the written page as a whole presents a fine appearance, yet it is more difficult to read than the poorest cramped school-boy hand. It very often happens that we can read every part of a letter but the most important—the signature. While you are young, get in the way of writing your name so plainly that there can be no doubt of a single letter in it. It may save yourself and others much trouble in after life.

Aunt Sue's Puzzle-Box.

Neo dink dan volgin edde,
Amy—ought a riflet ropo adn keva—
Ovcrp ikle a nity edes ;
Dan how nae lelt thaw dogo yam gnirps
Morf ehus a revy tillet night? J. C. C.

NUMERICAL ENIGMA.

I am composed of eleven letters.
My 1, 4, 2, 5 is a planet.
My 6, 11, 10, 9 is pretty poor when it blows nobody any good!
My 8, 7, 1 is an article of food.
My 10, 11, 3, 9 is a sort of avenue.
My whole is an American river. H. S. B.

CROSS-WORD.

My first is in father but not in son.
My next is in bread but not in bun.
My third is in purchase but not in buy.
My fourth is in pudding but not in pie.
My fifth is in strike but not in pound.
My sixth is in oval but not in round.
My seventh is in vigor but not in health.
My eighth is in money but not in wealth.
Select the right letter from every word,
And you'll find a name you have often heard.
H. L. MORTON.

DIAMOND PUZZLE.

- 1. Part of a day.
- 2. A vehicle.
- 3. To mark.
- 4. A geometrical figure.
- 5. A disease.
- 6. A girl's name.
- 7. Part of the hand.

PATCHWORK.

Take 1/2 of a hand, 1/4 of a fragment, 1/5 of a third, 1/2 of a lamb, and make an amusing puzzle of the whole.

CHARADE.

My first, a kind of seed
That in my whole's contained;
My next is sharp indeed,
Its wound with blood's soon stained.
My whole is ripe in fall,
Its taste delicious quite,
In shape 'tis like a ball,
With pulp both soft and white. HENRY.

although many of them are popped into the scrap-basket as altogether too poor for use.

J. H. W.—It is scarcely worth while to "Pr" well-known proverbs or verses, as one or two words will often give a key to the whole, and "spoil the fun."

BESSIE BENNETT writes to me on the 9th of May, and says: "You just ought to be in the country now; everything is as pretty as can be."—I am just going, Bessie. If there be one thing I love above another it is to see the

Gulliver in Brobdnag.

Perhaps the first questions you will ask will be, "Where is Brobdnag, and who was Gulliver?"—You will not be likely to find Brobdnag on any map or in any gazetteer, for the place, as well as Gulliver, was the work of a gentleman who had a very lively fancy, who described both as if they were real. Over a hundred years ago there appeared a book called Gulliver's Travels, by one Jonathan Swift, better known as Deau Swift, and it was a most interesting story; fifty years ago or less it was printed with pictures as a children's book, as the story was so well told that children could get amusement from it as they do from Robinson Crusoe. But it was not intended as a child's book; the author wrote it to ridicule some of the people and the fashions of his time. The story says that Gulliver was shipwrecked on a strange land called Lilliput, where the people were only six inches high; and it gives a great many amusing adventures that happened to him among these little people. He was first taken prisoner by them, having laid down to sleep near one of their cities. He found upon waking that he could not rise; the little fellows had made him fast by the hairs of his head, as well as by many cords over his limbs. They thus took him captive, and he lived for a while among these little people, doing many strange things. Although Lilliput was a fanciful name, it has become fixed in our language, and we call anything that is small "lilliputian."

After a while Gulliver escaped from Lilliput and reached home, but soon after he went on another voyage and got left by his ship in the land of the Brobdnagians, who were a race of giants, as much larger than he was as he was larger than the Lilliputians, and his adventures here were quite as strange and as laughable as those among the pigmies. He was taken possession of by a farmer, who put Gulliver in the care of his daughter, a bonnie lass, who had the beautiful name of Glumdalclitch. You can imagine the size she was said to be by the story that she had a box made in which to carry Gulliver about, like a pet bird. Everything in Brobdnag, according to this history, was as large in proportion as the people, or, to be exact, trees, birds, hailstones, and all other natural objects were eighteen hundred times larger than in England. After a while he went to court and lived with the king and queen. One of the royal attendants had a spite against Gulliver, and as he was walking in an orchard shook the trees, and the apples, each nearly as large as a barrel, came near killing him. He had wondrous battles with the linnets and other small birds of the country, as well as with a frog. For exercise he used to row in a boat which the princess hung up in her closet to dry after he had used it. But perhaps some of you may some day come across this quaint old book, which though written to ridicule the court of England, and princes and public men now long dead, is very bright and amusing for the way in which the story is told. Some very beautiful editions of this famous book have been published, with fine illustrations. The picture here given is from one of these volumes, and is by Morten.

AUNT SUE'S NOTICES TO CORRESPONDENTS.

EFFIE M. G.—I am glad you "all enjoy the puzzles so much." I can not do less than thank the dear children when they take the trouble to write and send me puzzles,

baby leaves rocked in their bud cradles by the May zephyrs to the sweet music of happy birds. Bessie squares LOVE five times and HATE ten times; she seems to find it easier to "get square" with hate than with love.

MINNIE, HESTER, AND ETTIE.—Thanks. I have a superabundance of numerical enigmas, but, under the circumstances, yours shall be prepared for publication.

Thanks, for letters, puzzles, etc., to M. Cator, Isaiah S. R., M. C. Stear, Mattie J., W. J. K., D. H. L., Ruthie A. B., Frank L. H., and Nellie Van.

All contributions for the PUZZLE-BOX should be addressed to AUNT SUE, P. O. Box 111, Brooklyn, N. Y.

farmer who first had Gulliver used to take him about and exhibit him, just as Barnum in later years did with Tom Thumb. The picture shows one of these exhibitions before the wise people and dignitaries of Brobdnag. His mistress, Glumdalclitch, is showing off her pet, who is evidently astonishing the natives. A portion of the box in which the lady carried Gulliver around is seen at one side, and she holds in her hand one of the straws of that remarkable country, which, according to Gulliver, served him for a lance or spear. If the persons who are witnessing his exhibition are fair specimens of the citizens of Brobdnag, we do not wonder that he was glad to leave the country, notwithstanding that he was a favorite with the king and the royal family.

Life Insurance.

MODERN science and civilization have achieved no prouder triumph than in the discovery and practical application of the principle of life insurance. As a discovery, it ranks with the most wonderful inventions of the century; as a beneficent institution, it outranks and overshadows every other that has been devised by the wit of man. The unwritten record of its benefactions are one grand epic, telling of the triumphs of human love over sorrow and death. The visible creations and monuments of its power are the strongest, purest, and most enduring financial institutions of the age.

Among these, conspicuous alike for its age, its stability, and its liberality, stands the United States Life Insurance Company of this city. Organized in 1850, when life insurance was an experiment in America, and little more than an experiment anywhere, this company comes forth from the trials and vicissitudes of nearly a quarter of a century with \$4,253,866.48 of assets, a surplus as to policy-holders of \$915,443.46 and a record without spot or blemish.

Twenty-five years is a long time in the history of American life underwriting. In that time, what financial changes, what social progress, what political revolutions have transpired. Through what storms and perils has every great moneyed corporation of the country passed—either to oblivion, or to a secure place in the confidence of men.

The founders of the United States Life Insurance Company were among the pioneers of life insurance in this country. Time and space are wanting with us to tell the story of their early struggles, of their patience, and a faith—a patience that “worked” rich experience, and a faith gloriously illustrated by works.

They contended with difficulties that to less sturdy souls would have been insurmountable. They explored untried regions, and wrought with unknown material. They builded with the trowel in one hand and the sword in the other, but they builded better than they knew. They laid the foundations, and sprung the arches, and established the economy of a building that has outlasted their lives, and promises to outlast the memory of their names—a building beneath whose staunch roof-tree more than 19,000 families are sheltered and secured.

Avoid Lead and Zinc Poison and Iron rust, by using **TIN-LINED LEAD PIPE**. It is the best Pipe for water, and is highly recommended. Price 16½ cents a pound, for all sizes. Descriptive Pamphlets sent by mail free. Colwell Lead Co., 313 Centre St., New York.

(CIRCULAR.)

Consumers Importing Tea Co.,
No. 8 Church Street,
P. O. Box 5,509. New York City.

This is a combination of capitalists to supply the consumers of Teas throughout the United States on the mutual principle.

We have experienced agents in all the best districts of China and Japan to select Teas especially for our trade.

We expect every consumer of Teas to render us all the assistance they can in carrying out our enterprise, as we make a specialty of **SUPPLYING CONSUMERS ONLY** (and allow no middlemen to make any profit on our importations), which will enable us to supply them with Teas at prices lower than have ever been known, and of those fine qualities that seldom reach the interior, being sold only in the large cities and among the very wealthy.

Hoping the consumer will take an interest in our enterprise, and send at once for a circular with full explanations of how to proceed to obtain our goods, we remain,

Most respectfully yours,

Consumers Importing Tea Co.,
No. 8 Church Street,
P. O. Box 5,509. New York City.

Entered, according to Act of Congress, in January, 1874, by the Consumers Importing Tea Co., in the Office of the Librarian of Congress, Washington, D. C.

B. K. BLISS & SONS' REMOVAL.

In consequence of our rapidly increasing business, and in sufficient accommodations in our former locality, 23 Park Place and 20 Murray Street, we have been under the necessity of making another removal, and are happy to announce to our friends and patrons, that we have leased the large and beautiful IRON BUILDING,

No. 34 Barclay Street,

a few doors west of Broadway, opposite the new post-office, which has been fitted up in a most convenient manner, to accommodate the various branches of our business. The additional room acquired by our removal, will give us seven floors, each 25 by 100 feet, and will enable us to systematize our business that we hope to be able hereafter to execute all orders, with which we may be favored, immediately upon their receipt, and prevent the delay, which has sometimes been unavoidable during the busy season of the year, for want of room.

In connection with our trade in seeds and bulbs, we purpose to make large additions to our stock of horticultural requisites, useful as well as ornamental, consisting of garden implements and rustic work of every description, vases and flower pots in iron and terra cotta, ornamental iron work, for the lawn, conservatory, or the window garden, lawn mowers of all sizes, suitable for the city lot or the most extensive lawn, descriptive circulars of which will be mailed to all applicants. We take the present opportunity to thank our many friends for their many favors and liberal patronage, and hope to be favored with a continuance of the same.

STONE & ORE BREAKER.

New Pattern, with Important Improvements & Abundant Strength.

For reducing to fragments all kinds of hard and brittle substances, such as **STONE** for making the most perfect **McADAM ROADS**, and for making the best **CONCRETE**. It breaks stone at trifling cost for **BALLASTING RAILROADS**. It is extensively in use in **MINING** operations, for crushing

IRON, COPPER, ZINC, SILVER, GOLD, and other ORES. Also for crushing **Quartz, Flint, Emery, Corundum, Feldspar, Coal, Barytes, Manganese, Phosphate Rock, Plaster, Soapstone, etc.** For Illustrated Circulars and particulars, address

BLAKE CRUSHER CO., New Haven, Conn.

Persons visiting New York, can be shown a crusher in operation at 137 Elm Street.

No More Loose Bolts and Nuts.

THE CELEBRATED "CUMMING" LOCK-NUT, Patented June 16, 1868.

No More Rattling **CARRIAGES** and **WAGONS.**
No More Dropping Down of **SHAFTS.**
No More Lost Bolts from **REAPERS** and **MOWERS.**

No More Flying Teeth from **THRESHERS.**
No More Bills for Repairs Continually. SEND FOR PRICE-LIST AND CIRCULARS TO

THE LOCK-NUT AND BOLT CO. OF N. Y., No. 17 Dey Street, New York.

Licenses granted to Manufacturers of Agricultural Machines, Carriages, etc.

TWO GOLD MEDALS

For a "Stone and easy movement of horses, its rods less than 1 1/2 inches per hour. Mechanical Construction of the very best kind, thorough and conscientious workmanship and material in every place, nothing shoddy, excellent work, etc." as shown by Official Report of Judges: Threshers, Separators, Raking Mills, Wood Saws, Seed Sowers and Planters, all of the best in the United States, and the only one in the world. **MINARD HARDER, Cobden, Ill., U.S.A.**

At Great National Trial, at Auburn, N. Y.

"BEST EVER MADE"

HARDER'S Premium Railway Horse Power, and Thresher and Cleaner, awarded THE FIRST PRIZE.

AWARDED THIS MACHINE

MEDAL MACHINES.
NEW YORK STATE AGRICULTURAL WORKS.

WHEELER & MELICK CO.,
Patentees and Manufacturers of

RAILWAY, CHAIN and LEVER HORSE POWERS, THRESHERS and CLEANERS, THRESHERS and SHAKERS, CLOVER HULLERS, FEED CUTTERS, ITHACA WHEEL HORSE RAKES, HORSE PITCHFORKS, SHINGLE MACHINES, STRAW PRESERVING RYE THRESHERS, &C., &C.

Send for Circular. **ALBANY, N. Y.**

THE UNION RAILWAY
HORSE POWER.

This superior Power produces much more power than other railway powers, and with very much less elevation. Also, Improved Threshers, Farm Grist Mills, etc., etc.

Send for Descriptive Circular. Address **WM. L. BOYER & BRO.,** Philadelphia, Pa.

AGENTS WANTED for the cheapest and best hay, straw, and stalk cutters. **Not to be paid for till tried on the farm** and found satisfactory. Circulars free. **Warren Gale,** Chicopee Falls, Mass.

The Peerless Thresher and Cleaner. Price \$225 and \$245. The Peerless, Straw Preserving Rye Thresher, Overshot. Price \$160.

We make the above a specialty. Railway and Lever Powers. **E. GILL & SON,** Trenton Agricultural Works, Trenton, N. J.

SPRING STEEL TOOTH. **ITHACA HORSE RAKE.**

EXCELS ALL OTHERS. Thousands in use giving entire satisfaction. Manufactured by **WHEELER & MELICK CO.,** Albany, N. Y. **WILLIAMS BROS.,** Ithaca, N. Y. **YOUNGLOVE, MASSEY & CO.,** Cleveland, O. **GRAND RAPIDS MFG. CO.,** Grand Rapids, Mich.

FOUST'S PATENT HAY LOADER, manufactured at the **MEADVILLE AGRI. WORKS, Meadville, Pa.** Warranted to elevate a ton of hay from the winnow to the wagon in five minutes, and take it as clean as by the hand fork, and to be adapted to all ordinary meadow land. Send for Descriptive Circulars.

Sayre's Bale Tie Fastener.

For drawing iron ties and wire tight on bales of Cotton and Hay. *Simple and durable.* Made of wrought iron. Price of Machine, \$5. State and County Rights for sale. For circulars and terms, send stamp to **R. STOKES SAYRE,** Cartersville, Ga.

Reliable Turnip Seeds.

SHAMROCK SWEDE, Am. Improved Ruta-Baga, Carter's Imperial, Laing's Swede, Cow Horn, Yellow Aberdeen, Tankard, Red Top and White Top Strap Leaved—at 10c. per oz., 25c. per qr. lb., 75c. per lb.

YELLOW GLOBE and Yellow Stone—at 10c. per oz., 30c. per qr. lb., \$1 per lb., 8c. per lb. for postage if ordered by mail.

SEED CATALOGUES and circulars of Agricultural Implements, will be sent on receipt of Postage Stamp.

R. H. ALLEN & CO.,

59 Wells St., Chicago, Ill.
South Western Exposition, New Orleans, La.
811 and 813 North Second St., St. Louis, Mo.

Lovejoy's New Style GLASS CUTTER AND PUTTY KNIFE

Cuts glass better than a diamond. Everybody should have one. Any child can use it. Sent to your address on receipt of 50 cents and stamp by ALVAN L. LOVEJOY, 229 Washington St., Boston, - - - Mass. Liberal discount made to dealers.

A GENTS WANTED to sell our justly celebrated Articles for Ladies' wear. Indispensable and absolutely necessary. **10,000 SOLD MONTHLY.** They give comfort and satisfaction. No female can well do without them. Sample sent, on receipt of \$2.00, FREE. Send for Illustrated Circular. LE PERLE RUBBER CO., 90 Chambers St., New York.

LIFE AND PUBLIC SERVICES OF Charles Sumner.

By C. EDWARDS LESTER.

The second edition ready. Book canvassers can still secure territory, and make money in spite of "hard times." Send for Press notices and Terms.

UNITED STATES PUBLISHING CO., 18 University Place, New York.

20th Thousand in Press.

AGENTS WANTED for the new book, LIFE AND ADVENTURES OF Kit Carson

by his comrade and friend, D. W. C. Peters, Brevet Lt. Col. and Surgeon, U. S. A., from facts dictated by himself. The only TRUE and AUTHENTIC life of America's greatest HUNTER, TRAPPER, SCOUT and GUIDE ever published. It contains full and complete descriptions of the Indian tribes of the FAR WEST, as seen by Kit Carson, who lived among them all his life. It gives a full, reliable account of the MODOCs, and the MODOC WAR. As a work of HISTORY, it is invaluable. A grand opportunity for agents to make money. Our illustrated circulars sent free to all applicants. Write and secure territory at once. DUSTIN, GILMAN & CO., Hartford, Conn.

BOOK AGENTS WANTED to sell the NEW BOOK TELL IT ALL

By Mrs. Stenhouse, of Salt Lake City,—for 25 years the wife of a Mormon High Priest. Introduction by MRS. STOWE. It tells of the "inner life," mysteries, ceremonies, secret doings, &c., of the Mormons. "As a wide-awake Woman sees them." It is actually overflowing with spicy revelations, humor, pathos, and good things for all. Ministers say "God speed it." Eminent women endorse it. Everybody wants it; and it is selling far and wide by thousands. Over 3,000 outfits were ordered in advance of publication, and Agents are selling 15 to 25 a day! We want 5,000 more Agents 1/0W—men or women. (Ladies say this book goes like hot cakes) and we will mail Convancing Book and whole outfit FREE, to any one who will canvass. Our large descriptive pamphlets with full particulars, terms, &c., sent free to any one. Reader! send for them. Address, A. D. WORTHINGTON & CO., Hartford, Conn.

AGENTS WANTED FOR THE CENTENNIAL GAZETTEER OF THE UNITED STATES.

No book has ever been published, of such universal interest to the American people. It appeals to no particular class alone, but to all classes; to men and women of all professions, creeds, occupations, and political opinions; to Farmers, Lawyers, Business Men, Mechanics, Physicians, Politicians, Teachers, Students, Manufacturers, Salesmen, men of learning, and men who can only read, to old and young. All want it as a book of constant reference, and to preserve for their children and children's children, as the only complete and reliable work, showing the gigantic results of THE FIRST ONE HUNDRED YEARS OF THE GREATEST REPELLED THE WORLD EVER SAW. It is not a luxury, but a necessity to every well-informed American citizen. Agents make \$100 to \$300 per month. Send for a circular. ZIEGLER & MCCURDY, Philadelphia, Pa., or Springfield, Mass.

The Lord's Prayer is written with forty-nine strokes of the pen, and 140 words per minute. The unemployed should learn this art. Price, by mail, 50 Cts. Agents wanted. Address T. W. EVANS & Co., 139 S. Seventh Street, Phila., Pa.

The Menmonites.—These people are now arriving at their new Western homes. A few weeks ago, a body of three hundred and fifty arrived in New York, bringing a common fund of \$60,000, and immediately started for their destination, in Nebraska. The industrious, frugal habits of these people, with their strong religious character, will make them as sturdy, persevering, and finally as successful a body of citizens as could be wished for.

Exportation of Live Cattle.—A recent experiment in shipping live cattle from New York to England failed, not for want of profit, but because of loss of the cattle by death on the voyage. This adverse result seems to have been due to bad management, for two successful voyages from the River Platte, in South America, have been made to England, with live cattle and horses. The trips occupied twenty-four days, and nearly one hundred head were taken at each trip, arriving in London in such fine condition, that they sold immediately to farmers, for feeders, at a profit of one hundred per cent above cost.

“Loss of Cud.”—“F. P.,” Anderson Co., Texas. This is an ambiguous term. It may mean dropping of the cud from the mouth, during rumination, or a suspension of rumination. Both may occur from the same cause, viz., indigestion, or eating injurious or poisonous plants. If this is the cause, the stomach and bowels should be cleared by a strong purgative, such as twelve ounces of Epsom salts, with one ounce of ground ginger along with it. But the latter may occur from the animal having swallowed something, which has injured the paunch, such as a thorn, a nail, piece of glass, or other rough, sharp substance. The symptoms which might be looked for in this case, would be a rapid wasting and weakness, a staring coat, and a dull-colored skin, with much loose scurf upon it, irregular appetite and bowels, with discharge of gas from the throat, and accumulations of it in the paunch. Nothing can be done in this case but to trust to chances, and a natural recovery, leaving the animal at rest, to facilitate a cure of the injured parts, or the expulsion of the intruding substance, if that is possible.

Packing Butter.—“S. J. T.,” Susquehanna Co., Pa. It would hardly be safe to pack butter in glass, for shipment to a distance. It is hopeless for those distant from the city markets, to compete for the fancy butter trade, in which appearance goes for a good deal. But if the butter is extra good, and is packed in new tubs or pails, it will always sell at the top of the market, wherever it may come from, as soon as it gets known.

Twins.—“C. R. D.,” Brookline, Mass. It is only occasionally that a twin heifer or bull fails to breed, and the fact that this happens, although very seldom, should not be considered as evidence of the infertility of these animals, until it is proved. We would not, therefore, turn a promising heifer calf into veal, because she was a twin with a bull calf. The term, “free marten,” sometimes used to designate such an animal, is a meaningless term, and the idea that it is necessarily a hermaphrodite, or sexless animal, is an absurdity. A pair of twin Shorthorn heifers recently sold for \$11,000, and from a pair of twin heifers a family of excellent Short-horns has been raised in England.

Sand for a Cranberry Marsh.—“T. P.,” Huron Co., Mich. The purpose for which sand is used to cover the surface of a cranberry marsh, is to prevent the growth of weeds until the cranberry-plants can get possession of the surface. Loam would not answer this purpose, and it would be worse than useless, because it would foster weeds. Only clean sand from a river bed or a bank should be used, and should be so free from clay as not to cohere when pressed in the hand.

Forest Fires.—“W. W. S.,” Green Co., Wis. The danger from fire to fences and farms, may be greatly avoided by keeping the fence rows free from weeds and in grass. The grass should be mown every year for hay. A strip outside of the fence, of at least six feet wide, should be also kept in grass, and when fires are running, and danger is apprehended, a few furrows should be run with a plow outside of this grass strip. The too common practice of building the fence in the midst of the rubbish of the clearing, or upon the very verge of the uncleared ground, is a dangerous one, and should be avoided.

Blood Diseases in Stock.—Years ago, deadly epidemics, which carried off thousands of the inhabitants of large cities, and which frequently penetrated into rural districts, with disastrous effects, were common. These were considered as mysterious visita-

tions of Providence, and calamities which were unavoidable. But their true nature came to be understood in time, and it was found that these fearful diseases were inevitable results of a transgression of natural laws, and a want of simple sanitary precautions. Exactly the same occurs now, every season, with our stock. Cholera, amongst hogs, is a typhoid disease, originating from a poisoned condition of the blood; and while it is incurable, it is entirely preventible, by the use of common precautions; so the Texan, or Spanish fever, in cattle, black-leg in young stock, rot in sheep, and all the various so-called murrains, which devastate the herd, as well as spinal meningitis, and the epizootic amongst horses, are preventible; and if the same care is taken amongst stock, as amongst ourselves, to feed well and judiciously, to use only pure water, to ventilate and keep clean the stables, and to watch the first approach of disease, little would be heard of these destructive diseases.

Bankrupt Farmers.—It rarely happens that a farmer, who minds his business, and refrains from speculations, can become a bankrupt, and then only through some unfortunate neglect, mistakes, or accidents, that in general are avoidable. But at the present time, some of those farmers who have gone into tobacco growing, and have stored their crops for higher prices, for two or three years past, and have borrowed money to carry over their stock of leaf, are in the disgraceful position of bankrupts. Their property will now be sacrificed by their creditors. This is surely a lesson to be heeded. We have taken pains to advise our readers to observe caution, with regard to this tempting crop, both early this season and last, and our caution has been widely copied by other papers. Farmers can not be too careful about growing special crops, or holding for a rise, which may never come.

Death among Horticulturists.—By some accident, we omitted at the proper time, to notice the decease of two persons well known to the horticultural public—Robert Morris Copeland and Mark Miller. Mr. Copeland was an occasional contributor to the *Agriculturist*, and was best known by his work, entitled “Country Life,” which is a very full compendium of rural affairs. He was, by profession, a landscape gardener, in which, especially in New England, he was highly appreciated. He died at Cambridge, Mass., April 10th last. . . . Mr. Miller, whom we met at the meeting of the American Pomological Society at Boston, in September last, in a very feeble condition, never recovered from the illness by which he was then nearly prostrated. He was highly esteemed at the West, as a sterling pomologist, and was for many years engaged in promoting the interests of fruit growers. He established the “Wiscousin Farmer,” and, after removing to Iowa, the “Western Pomologist,” which journal afterwards became the “Pomologist and Gardener,” and was ultimately united with the “Horticulturist” of New York. After the consolidation of the two journals, Mr. Miller remained editorially associated with the *Horticulturist*.

Curtailling Crops.—“Subscriber.” The idea that farmers can ever restrict production so as to control the prices of their crops, may as well be abandoned at once as impracticable. Farmers can not even raise exactly what they want each year, because the ground must be cultivated, or it is worse than useless, and the necessity for raising precisely such and such crops is absolute. A farm is different from a stone-quarry or a mill, which may lie idle without injury. A farm must go on, and it is only seldom that a farmer has a choice of what he may raise. But he may very readily so provide that his crops, instead of coming upon the market in a crude state, should be fed to stock, and thus be turned into a shape in which they might increase, as by compound interest, or may be made more salable.

Cheat or Chess Once More.—“Farmer,” Stamford, Ky., writes: “We want an expression from you in reference to the production of ‘cheat,’ (1) Is it a species of grass? (2) or what causes it to spring up in wheat fields or meadows? (3) If a stalk of wheat is bitten off below the point, cheat will branch out from the root. (4) In places in wheat fields where water stands any length of time after a rain, cheat is found in abundance. (5)”—(1) In former years, we have discussed this subject in full, but are ready to renew it when assertions are accompanied by proofs. (2) Yes. (3) We have no reason to believe that cheat, or chess, is produced in any manner different from other plants—i. e., from seeds. (4) This is a statement that has been frequently made; let us have the specimens. We will willingly pay the expenses on a box containing plants, known and proven to be wheat which bear cheat or chess. (5) In wet places, wheat or its seed is killed, while the cheat survives. Our correspondent should read the report of a committee of the New York State Agricultural

Society, published several years ago, and he will see that all the various methods to cause wheat to turn to chess were thoroughly tested. Ten or more years ago, Mr Judd offered a large premium for a specimen which should be pronounced by competent botanists to be part wheat and part chess. The offer remained open for several years, but no specimens were presented.

Diarrhoea in a Colt.—A “Subscriber,” Lancaster Co., Pa. In case a sucking colt suffers from diarrhoea, we would give the mare cold rice water for drink, made by boiling four ounces of rice in a gallon of water. This should be mixed, when cold, with her usual drink. One ounce of prepared chalk and one of salt should also be given in each feed for a few days, until the diarrhoea in the colt is stopped. It is probably due to acidity of the mother’s milk, which may be caused by overwork or indigestion, or from indigestion in the colt. Some chalk should also be placed where the colt can lick it. The above remedy is also effective when young calves are similarly troubled.

“Esquire.”—“E. N. N.” is in trouble, because we and others address him as “Esquire,” and thinks it no more proper than to call him “Rev.” “Doct.,” etc., and asks our views on it. We have no views on the subject whatever, but have found that the world runs much easier if we fall in with its harmless usages, than to try to reform them. It is very absurd to say to a man, “How do you do?” when we do not care a snap how he does. Yet it is a part of the grease that keeps our social machinery in order.

Foreign Imports and Native Exports.—The Bureau of Statistics furnish the following very gratifying figures, showing the exports and imports of merchandise for seven months, ending January, 1874, as compared with those for the same period in 1873, viz:

Periods.	Imports.	Dom’c exp’ts.	Foreign Specie val. exports.
7 months ended Jan. 31, 1873.	379,190,969	329,906,257	15,970,837
7 months ended Jan. 31, 1874.	329,496,105	360,837,772	12,857,469

This shows a remarkable change in the course of trade, being a balance in our favor of over \$44,000,000 the present year, in place of a balance against us of nearly \$24,000,000 last year, or a difference altogether of over \$78,000,000.

Rape and Vetches, or Tares.—“R. D. W.,” Washington, Pa. Rape (*Brassica napus*) is a plant nearly allied to the turnip, but has not an edible root. It is grown for its stalk and leaves, which make a fine fall, or winter, pasture for sheep. The crop may be sown in July, or August, upon an oat stubble, broadcast, at the rate of a peck of seed per acre, and may be pastured from November until covered too deeply with snow. Sheep will gather a good deal of it by pawing away the snow, if not too deep, through the winter, and the green feed and the exercise are excellent for them. The refuse of the crop may be plowed under in the spring. Tares (*Vicia sativa*) are a leguminous plant, not unlike peas. They may be sown in spring, or fall, (there being two varieties, as in wheat), and cut for green fodder, or for soiling during the summer. 2½ to 3 bushels of seed per acre are generally sown. Either of these requires rich soil for successful culture. Tares are excellent green fodder for horses.

Disease of the Lungs.—“J. McD.,” Perry Co., Ohio. Amongst highly bred animals a disease known as emphysema, or the presence of air in the cellular tissue of the lungs, is more frequent than in other stock. Hereditary taint and high feeding are generally the causes. Difficult respiration and discharge, mixed with blood from the nostrils, generally accompany the disease, as do also an irregular condition of the bowels, falling off in flesh, staring coat, and poor appetite. The presence of the air in the tissue of the lungs enlarges their bulk and destroys their elasticity, and thus interferes with respiration and the circulation of the blood. There is no remedy, and the only means of palliation is to feed sparingly, but frequently, with the most nutritious food, to keep the animal still and in the most comfortable condition, to card daily with the wire card, which will assist circulation, and to give tonics, such as half a dram of sulphate of copper, with a tea-spoonful of ginger daily, in the feed.

The Value of Chandler’s Scraps.—“J. H. B.,” Westchester, Pa. The refuse of tallow or lard renderers is worth more for feed than for manure. The fat it contains is valuable when fed, but useless as a fertilizer. It is better, therefore, to feed the scraps, because then nearly all the nitrogen they contain will be found in the manure. These scraps are worth about 1½ cent a pound.

CRANDALL'S GREAT SHOW.—THE ACROBATS.

CRANDALL'S GREAT SHOW.—THE ACROBATS.

A HOME EXHIBITION.

Here is genuine FUN for you, GIRLS and BOYS, with nothing about the Show to injure your morals, but on the contrary, a great deal to develop your constructive or mechanical talents. These new ACROBATS of Mr. Crandall are the most wonderful toys we have ever seen. If you carefully examine each of the figures on these two pages, you will see that there are ONLY SEVEN different pieces. A box of these ACROBATS contains four bodies, four heads, eight arms, eight legs, one flag, and six pieces of wood, or thirty-one pieces in all, and yet from these few elements you can not only make pictures similar to those before you, but many thousands of others. The pieces are variously colored, which can not be shown in our ink engravings. They are so grooved and jointed and fitted, that they fasten strongly together in all conceivable positions. There is just one unpleasant thing about these ACROBATS, viz., everybody that has seen them wants them, and Mr. Crandall can not begin to make them as fast

as they are wanted, and it may be some time before all our boys and girls can have them. These amusing new toys are creating a furore among all the children (and old folks too) who have succeeded in getting hold of them. Every day's supply received at 245 Broadway, has "gone off like hot cakes," and correspondents are inquiring for them, their price, etc. When the market can be supplied they will be on sale by the toy dealers generally. The Orange Judd Company are selling them as fast as received at \$1 a box, delivered at 245 Broadway, New York, but if to be sent anywhere out of the city, the cost of carriage by express or otherwise must be added to the \$1 a box.

PRAIRIE, EIGHT MILES EAST FROM LINCOLN, NEB.

A representation of crops and cattle, without fences, under the Herd-law of Nebraska.

13

**IF YOU WANT A FARM OR HOME,
YOU SHOULD BUY OF THE
BURLINGTON AND MISSOURI RIVER RAILROAD CO.
IN IOWA OR NEBRASKA.**

- BECAUSE**—Their prices are low, ranging for the best land from Three to Ten Dollars per acre.
- BECAUSE**—No payments are required of the purchaser for four years, except interest at six per cent.
- BECAUSE**—After the fourth year only one seventh of the principal is payable annually till the whole is paid.
- BECAUSE**—You are not required to go into a wilderness, these being well-settled States, the population of which is rapidly increasing.
- BECAUSE**—The mildness of the climate and fertility of the soil is such that the settler can pay for his farm from the products raised upon it long before the time when the principal becomes due.

- BECAUSE**—Failure of crops from drouth is unknown.
- BECAUSE**—Large allowances are made upon fare and freight, thus giving low rates on both to purchasers of this Company's lands.

AND YOU SHOULD BUY THIS YEAR.

- BECAUSE**—Purchasers of our lands in Nebraska during 1874 who cultivate one-half their land within two years from their purchase are allowed a reduction of twenty per cent on its price.

Send for Circulars, with full information on all points, to

GEO. S. HARRIS, Land Commissioner,
At Lincoln, Nebraska, for land in Nebraska. At Burlington, Iowa for land in Iowa.

ORANGE JUDD COMPANY, 245 BROADWAY, NEW YORK.

A Practical Book, one that Architects, Builders, and Carpenters can not afford to be without, entitled

DETAIL, COTTAGE, AND CONSTRUCTIVE
ARCHITECTURE,

Containing 76 FULL PLATES, 20 plates more than before offered in a similar work for Ten Dollars.

Published under the direction of A. J. BICKNELL.

Showing a great variety of Designs for Cornices, Brackets, Windows and Window Caps, Doors, Piazzas, Porches, Bay and Dormer Windows, Observatories, Towers, Chimney Tops, Balconies, Canopies, Scrolls, Gable and Sawed Ornaments, Fences, Stairs, Newels, Archedrives, Mantels, Plaster Finish, etc., etc., including Forty-five Perspectives, Elevations and Plans of Modern Designs for Cottages with Details, and Eighteen Elevations of Summer Houses, Villas, Seaside Cottages, and Country Houses, together with Fourteen Designs for Street and Store Fronts, with Inside Finish for Stores and Banks; also, Framing for Dwellings, Barns, Exhibition Buildings, Roofs, Bridges, etc., etc., making in all a Practical Book for Architects, Builders, Carpenters, and all who contemplate Building or Remodeling Wood, Stone, or Brick Buildings. One Large Quarto Volume, sent Free by Mail or Express, on receipt of Price. \$10.00.

CARPENTERS' and BUILDERS' ASSISTANT,

And Wood Workers' Guide,

By L. D. GOULD, Architect and Practical Builder.

Containing 23 Plates, fully described; also, tables of the strength of materials; technical terms used by carpenters, etc., etc. This work is intended to combine all the knowledge the workman requires to construct any design in carpentry, by a new and easy system of lines, reducing the science of construction to an agreeable and pleasant occupation, rather than an unpleasant task. One 8vo. volume, bound in cloth. Price. \$3.00.

ARCHITECTURE.

By CUMMINGS & MILLER.

A Practical Book on Architectural Details; containing over One Thousand Designs and Illustrations, showing the manner of constructing Cornices, Doorways, Porches, Windows, Verandas, Railings, French Roofs, Observatories, Piazzas, Bay-Windows, Cast-Stone Work, various styles of Modern Finish, and Street Fronts of Houses, Stores, etc., etc. One Large Quarto Volume. Price, post-paid. \$10.00.

Loth's Practical Stair-BUILDER.

A complete Treatise on the Art of Building Stairs and Hand-Rails. Designed for Carpenters, Builders, and Stair-Builders. Illustrated with Thirty Original Plates. By C. EDWARD LOTH, Professional Stair-BUILDER. One large Quarto Volume. Bound in Cloth. Price. \$10.00.

CUMMINGS' Architectural Details.

CONTAINING

387 Designs and 967 Illustrations

Of the Various Parts Needed in the Construction of Buildings, Public and Private, both for the City and Country.

ALSO, PLANS AND ELEVATIONS OF Houses, Stores, Cottages, and Other Buildings.

BY M. F. CUMMINGS, A.M., Architect, Associate Author of "Architecture, by Cummings & Miller," and "Modern American Architecture, by Cummings & Miller."

Nearly eight years ago, the author of this work, in connection with Mr. C. C. Miller, architect, published a work on architectural details, which, as soon as it was presented to the architects, carpenters, and builders of the country, met with a rapid sale; and, judging from the number of editions through which it has passed, and the great circulation reached, it must have met the approval of those most interested in practical architectural works, and must have filled, in a measure, a want before unsupplied.

The success of that book has induced the author to publish a second one, which is now presented to the public, and in it will be found an extensive collection of designs illustrating the features which go to make up structures such as are needed to meet the wants of the American people.

What has been aimed at is this: To present a mass of architectural details, easy of construction, pleasing in form, and generally of an inexpensive character, and all so designed that a great variety of selections may be made from them, which, when combined in a building, will produce a harmonious whole; and it is believed by the author that this work will be found to be of value, and that its design is practicable, for there are hundreds of towns and villages, in all the States of the Union, in which the wants of the people continually demand the erection of buildings, largely of wood, and which in the hands of the builder and workman may be made elegant and pleasing in all their features, provided they have at hand a guide such as this book is intended to be.

Royal Quarto. Price, post-paid, \$10.

ORANGE JUDD COMPANY, 245 BROADWAY, NEW YORK.

Newly Revised and Enlarged Edition.

Practical Floriculture.

A Guide to the Successful Propagation and Cultivation of Florists' Plants.

By **PETER HENDERSON,**
Author of "Gardening for Profit."

Beautifully Illustrated. Price, Post-paid, \$1.50.

In this work, which has everywhere become so deservedly popular, not only is the whole "art and mystery" of propagation explained, but the reader is taught how to plant and grow the plants after they have been propagated. The work is not one for florists and gardeners only, but the amateur's wants are constantly kept in mind, and we have a very complete treatise on the cultivation of flowers under glass, or in the open air, suited to those who grow flowers for pleasure as well as those who make them a matter of trade. The work is characterized by the same radical common sense that marked the author's "Gardening for Profit," and it holds a high place in the estimation of lovers of floriculture. The new edition has been thoroughly revised by the author, and much enlarged by the addition of valuable matter.

The following are a few of the subjects embraced in the latest edition:

Laying out Flower Garden and Lawn; Designs for Grounds and for Greenhouses; Soils for Potting; Cold Frames; Hot-Beds; Greenhouses Attached to Dwellings; Modes of Heating; Propagation of Plants by Seeds and by Cuttings; Culture of the Rose and Tuberoses; Growing of Winter-flowering Plants; Construction of Bouquets, Baskets, etc.; Parlor and Window-Gardening; Wardian-Cases and Ferneries; Insects; What Flowers Grow in the Shade; Culture of Grape-Vines under Glass; The Profits of Floriculture; How to Become a Florist, etc., etc.

THE ILLUSTRATED Book of Poultry,

With Practical Schedules for Judging, Constructed from Actual Analysis of the Best Modern Decisions.

By **LEWIS WRIGHT,**

Author of "The Practical Poultry Keeper," "The Brahma Fowl," etc.

ILLUSTRATED WITH Fifty Colored Portraits of Prize Birds,

Painted from Life by J. W. Ludlow.

Carbonized Enamel IS AS PURE AS GLASS.

The Bridgeport Mfg Co., OF BRIDGEPORT, CONN.

(Office, No. 88 Chambers St., New York). Have the exclusive control of this valuable enamel, and are using it to cover all of their celebrated

American Submerged Force Pumps.

They also enamel pipe inside and out, which delivers the water chemically pure. The Enamel is composed of vegetable matter, baked on so hard that a blow does not break it, and it resists acids that eat gold.

Gentlemen: I have examined the sections of Carbonized Enamel Pipe submitted to me by you. It is superior to any pipe I have ever seen for resisting acids and conducting water from springs or for use in connection with pumps, etc. The Enamel adheres with astonishing tenacity, withstanding even heavy blows; and the surface of the metal where the enamel is beaten off seems to be protected against the ordinary action of water.

M. C. WELD,

Late Associate Editor Am. Agriculturist.

MUDGE & WOODS, No. 88 Chambers St., N. Y., are the exclusive selling agents of the Bridgeport Mfg Co. for the Licenses of States, counties, and towns rights for the American Submerged Suction and Force Pumps.

THE PEOPLE'S Force Pumps.

Awarded medal of American Institute over all competitors last fall. For the house and out of doors. Non-freezing, and adaptable to wells from 6 to 100 feet deep. Highly recommended for city houses on account of their great power. Parties about to supply themselves are invited to call and examine. Circulars sent on application. Numbers are particularly requested to call.

See "Notes from the Pines," on page 182, May number, of *American Agriculturist*.

AMERICAN AGRICULTURIST.

PATENT DEPT.

IMPORTANT TO INVENTORS.

American Agriculturist PATENT DEPARTMENT

In compliance with the request of numerous inventors, we have organized a

PATENT DEPARTMENT

in connection with this office for the transaction of all business connected with

Securing Patents

in the United States and foreign countries.

The character for

Reliability

which has been maintained by the AMERICAN AGRICULTURIST for more than thirty years will be carefully guarded in this as in other departments.

All Inventors

desirous of procuring patents at moderate cost are invited to forward (express prepaid) a model of their invention, with a brief description of its working. The model should not exceed one cubic foot in dimension. Upon receipt of model an opinion as to patentability will be given free of charge.

Preliminary Examination

at the Patent Office, to determine patentability, will be promptly made for a fee of \$5.

Litigation of Patents.

The services of the best counsel have been secured to prosecute or protect before the U. S. Courts and the Patent Office the claims of those intrusting their business to this agency.

Specifications, drawings, engravings, models, and all other appliances furnished at moderate prices.

In all dealings with this Department inventors may depend upon promptness, fidelity to their interests, and the best services which can be rendered by thorough experts. For full particulars, address

AMERICAN AGRICULTURIST PATENT DEPARTMENT ORANGE JUDD COMPANY, 245 Broadway, New York.

Specimens supplied by The Major & Knapp Engraving, Mfg. and Lithographing Co. 53 & 55 Park Place, N. Y.

WANTED.—The United States Life Insurance Company is now re-organizing its Agency Department, and is prepared to negotiate with gentlemen of business ability to act as Agents. Previous connection with the business is not considered necessary. Apply at the Home Office, 261 Broadway, New York. JOHN E. DEWITT, President.

BOOKS FOR FARMERS and OTHERS.

Rich Farming Lands

For Sale VERY CHEAP by the
Union Pacific Railroad Co.

MILLIONS OF ACRES

IN THE

STATE OF NEBRASKA,

AT PRICES RANGING FROM

\$2.00 to \$10.00 per Acre.

Five and Ten Years' Credit Given,
with Interest at Six per Cent.

**Convenient to Markets East
and West.**

The Lands of the Union Pacific Railroad Company are the odd numbered Sections for twenty miles on each side of the road. They are located in the valley of the Platte and its tributaries—a region widely celebrated for its beautiful scenery, rich, productive soil, and mild and healthful climate. The winters are short, and the atmosphere dry and invigorating. Epidemic diseases are unknown. The surface is undulating, covered with nutritious grasses, and watered with numerous clear running streams. All the productions of the Eastern and Middle States are grown with success. Wheat and Corn are the staples, and it is well adapted to the cultivation of Fruit. For Stock-raising, in all its branches, these lands are unsurpassed. The Union Pacific and its branch railroads furnish Market Facilities unequalled. Education is free. One-eighteenth part of the entire area forms a permanent endowment of the Public Schools. Good Society, Schools, Churches, Post-Offices, Mills, Stores, and other advantages of civilization are enjoyed.

The liberal provisions made for Education, the freedom from State debt, the rapidity with which this section is settling, the numerous towns and villages springing up, offering inducements to the merchant and mechanic, render this tract a most desirable location for the industrious man of limited means to secure a comfortable home, and acquire competence, independence, and position.

These lands are granted directly to the Railroad Company. The title given to the purchaser is absolute, in fee simple, free from incumbrances. They are sold in tracts of forty acres and upwards, giving the man of small means an equal chance with the capitalist to make a safe and profitable investment, one which can not be destroyed by fire or flood, a provision for future support, not affected by *revulsions*, or liable to the fluctuations of stocks.

Full information in reference to particular localities will be furnished, good lands selected, and sales made, free of charge, for persons not desiring to incur the expense of coming to examine the lands in person.

Beckwith Sewing Machines

\$12 and \$20.

We have offered as a Premium, and also for sale, for more than a year past, the **Beckwith Sewing Machine**, which has been fully described in previous numbers of this paper. We have already given and sold more than one thousand of these machines, and testimonials of satisfaction have come from every quarter.

We still offer the **Beckwith Sewing Machine, Improved**, price \$12. A new and very simple braiding-foot has been made, by which a child can sew on braid without the least trouble, following any desired pattern with ease; also a new arm, spiral spring and lever for raising the presser-foot, all of which are now set in a position that leaves the needle free to be threaded. The joint is much enlarged, and the machine is otherwise greatly strengthened and improved. The use of the braider-foot alone will be valued more than the cost of the machine.

Each of these machines is put in a neat, compact box, with *hemmer and guide, oil-can with oil, thread, different-sized needles, etc.*, with full Printed Directions for using. On receipt of \$12 we will send one of these machines to any address, expressage to be paid by the purchaser.

The Machine as a Premium.

We will give one of these \$12 machines to any one who will collect and forward sixteen subscribers to *American Agriculturist* for one year, at \$1.50 each, expressage on the machine to be paid by the recipient of it.

THE BECKWITH PORTABLE FAMILY SEWING MACHINE.

PRICE \$20.

Enlarged and Improved. Its Weight is 7 Pounds.

While we continue the offer of the Improved \$12 Machine as heretofore, we now offer the new

PORTABLE FAMILY MACHINE,

price \$20, which comprises all the excellencies of the former, with many valuable improvements. Its size and power are increased, and its capacity thus very much enlarged, without impairing its portability. There have been added cam and eccentric movement, a balance-wheel, and also an oscillating needle-clamp, by which the length of stitch can with the greatest ease be changed to the finest shade of variation without touching the needle.

To any one sending us \$20, we will send one of the Machines (packed in a neat, portable case, with handle to carry it easily), expressage to be paid by purchaser.

The Machine as a Premium.

We will give one of these \$20 Machines to any one who will collect and forward to us **Thirty Subscribers to American Agriculturist** for one year at \$1.50 each, or **One Hundred** at \$1 each, expressage on the Machine to be paid by the recipient of it.

Almost any lady can readily secure the small number of subscribers required to get either the \$12 or the \$20 Machine as described above; or some friend can thus obtain it for her as a present.

ORANGE JUDD COMPANY,

245 BROADWAY, NEW YORK.

AUGUST, 1874.

AMERICAN

AGRICULTURIST

FOR THE FARM, GARDEN & HOUSEHOLD

Vol. XXXIII

Number 8

PUBLISHED BY THE
ORANGE JUDD COMPANY,
245 BROADWAY,

PHASES OF THE MOON.

Table showing moon phases for Boston, N. York, Vasan, Ches'ton, and Chicago, with columns for Moon, Day, Hour, and Minute.

AMERICAN AGRICULTURIST.

NEW YORK, AUGUST, 1874.

The American Agriculturist is for the whole country. It is devoted, not to one section alone, but to East and West, South and North alike, and it aims to give such information as shall be useful and practical everywhere. In our wide country with a great diversity of climate, the ways and needs of farmers differ somewhat. The principles upon which they work, however, are the same everywhere; good cultivation, killing weeds, gathering manure, sowing good seed, making the most of the crops grown, treating the farm stock in the best manner, and practising economy, all bring about the same profitable results everywhere. We endeavor to teach principles, and to show our readers how they may adapt their practices to them. Just now is an excellent time to study a few of the first principles of good farming. There is as much leisure in this month as a farmer usually enjoys. He should use this to take a rest. Haying is over, and fall wheat is harvested. Corn is laid by, and by the middle of the month oats and spring wheat will be cut. There is plenty of work to be done, but it can lie over a few days without damage, or those who must stay at home to take care of things can attend to them. Every farmer who can, should go from home with his wife, and visit some other locality. The Western farmer should go East, and the Eastern one should go West, and both should exchange places for a few days with the Southern plauter. By doing this, much valuable knowledge will be gained, and new ideas gathered. When he comes back, he will probably think his own place the best he has seen, or will have found out how he can make it so. There will be less local jealousy, and each will learn that his brother farmers have all something to contend with. If there is the grasshopper or the chinch bug in one place, there is the Hessian fly or the army worm in another, and there is in each locality some drawback. The farmer who travels will soon learn that it is in ourselves and not in our fortune that we are thus or thus. He will come back more contented with his lot, more determined to make the most of the advantages he enjoys, and better able to do it than before.

Hints about Work.

Oats, although the season is backward, will soon be ready to harvest. They should be cut before they are dead ripe. When ripe they shell badly and many are lost. The straw is also better for feed when cut early. The use of damp rye straw for bands in binding, will save time as well as oats.

Buckwheat may be sown the first week in this month, and yet escape frost. It is a crop which costs little to put in, and pays well for the cost. If injured by an early frost it is worth all the expense for plowing under.

Corn should not be laid by while a horse can pass through the rows. A muzzle will prevent him from biting the stalks. The soil should be kept stirred, and not allowed to bake after a shower. Late weeds rob the crop as much as early ones. If they are allowed to ripen their seeds, they will do a vast amount of mischief. These should be removed by hand. No plow should be used to work corn at this late season. The roots now occupy the whole ground. Two inches of mellow soil on the surface, will keep the soil moist, and no deeper cultivation should be given. In rich prairie soils, and where fall pasture is scarce, rye may be sown in the rows at the last working. This will give valuable late pasture or early spring feed. But generally such stolen crops are better avoided. Pumpkins grown amongst corn are as bad as weeds. Better have a portion of the ground prepared for such crops.

Root crops must not be neglected. They must be kept clean, and thinned out severely. Strap-leaf turnips may be sown early this month. Use plenty of seed, two pounds per acre, sown in drills 24 to 28 inches apart, will not be too much for safety. 150 lbs. of superphosphate, fine bone flour, or Peruvian guano near the seed, will greatly help the crop. With roots the start is the great point. Thin out to 12 inches apart in the row, when the plants are well established, and keep the ground free from weeds. Home grown seed is better than imported.

Grass fields will be greatly benefitted by a top dressing of fine manure. If nothing better can be had, a few loads of rich soil from roadsides or scrapings of the barnyard may be spread. It is poor economy to pasture meadows or young clover, good care at this season will strengthen the roots, and give a heavy aftermath which may be pastured by and by.

Pastures need looking after. Bare and mossy spots should be harrowed, sowed with fresh seed, and a dressing of lime and ashes or plaster, may be given. A bushel of salt per acre is often very useful. Weeds should be cut with the mowing machine, and gathered and burned. Brush should be cut close to the ground, with a short stiff scythe or a brush hook.

Weeds should be kept down everywhere. Thistles, wild parsnips and carrots, mulleins and burdocks, in neglected corners and fence rows, should be cut up by the root, and the tops gathered and burned. Many weeds are now ripening their seeds, and if neglected will make work for many years to come.

Drainage may now be laid out for future completion. Springy places should be staked, and the course of a drain that will carry off the water, should also be staked out. Swamps are now dryer than usual, and ditches may be dug comfortably. Throw out the muck on one side of the ditch only. Put it in heaps, and not in a continuous row, which would prevent surface water flowing into the ditch by and by. The muck will be dry before winter, and so will the ground. The muck can then be easily hauled at any time to the barnyard. Read Ogden Farm papers for last month once more.

Saving Seed.—A large quantity of grass seed may be saved, by cutting the ripe bunches from clean fence rows, or patches which may have been left for this purpose in the meadows. Where any variety of grass grows unmixed with others, it should be left in this way. The grass may be cut with a grass hook, tied in bunches and thrashed or rubbed out, and the seed saved in grain bags. This is a little thing, but hundreds of such little things

may be done in a year upon a farm, and in the whole are worth looking after.

Manure, making is always in order. Everything that can add to the pile should be gathered. Coarse weeds that have no seed in them may be put into heaps, with a few bushels of lime and covered with earth. They will soon decay and make a good dressing for grass lands or pastures. Or they may be added to the barnyard manure. Early potato-tops, sods from the roadside, road dust, and all such matter should be added to the compost heap. It will ferment rapidly in the hot weather, and if turned over or wetted with liquid manure, it will be ready for use next month for the wheat or rye ground.

Thrashing should be done as soon as possible. Grain is safe from many enemies in the granary. Besides it is the same as so much cash, and is equally available. Markets should be closely watched this year. It is difficult to say how they may turn. An advance is just as likely as a decline, and with wheat in the granary it can be taken advantage of. Seed wheat should be carefully selected. The heaviest grain only should be taken, and there should be no cracked kernels in it. This should be looked to while thrashing. If the thrashing machine is hired, a farmer should do nothing but watch things. Watch the straw closely, and see that no grain is left in it. See that the hired teams do their share of the work. If a steam thrashing machine is used, see that it does not effect the insurance on the barn. For farms of less than 100 acres, a good two horse railroad power machine is probably the best. With a cleaner attached it is so much the better. The whole may be set in the barn, and grain may be thrashed any day at an hour's notice. There need be no waste of straw. As a mow is emptied of grain, the straw should be returned. This is better than stacking it out of doors. Before long there will be few places in the country, where it will pay to throw the straw away.

Plowing for Wheat upon oat-stubble should be done as soon as the oats are off. A light furrow, to cover the stubble, is sufficient. The oats left upon the ground that the pigs have not gathered, will soon sprout. When they are well started, a thorough cultivation will kill them. If a clover sod is to be plowed, it should be turned perfectly flat. If lime is to be used, it should be drawn now, and piled upon the plowed ground in small heaps. A bushel to every two rods each way will give 40 bushels to the acre. The heaps will slack in a few days, or with one shower. The lime may then be spread evenly, and the ground left until next month.

Horses should not be stinted in their feed. Work-horses should be put out to pasture at night, but they should have their usual allowance of other feed. They have some lost flesh to make up. Scrape off the eggs of the bot-fly from their fore-legs and shoulders with a sharp knife, or wash them off with warm water every evening. Three hour's rest at noon is not too much for the team while plowing. The time may be made up at morning and night. This arrangement is not a bad one for the driver as well. Give water often, and don't forget a handful of corn-meal stirred into it.

Colts may be taught to eat a little meal or bran, and to be handled freely. The gentlest possible treatment should be given to all young stock at this season, and careful attention.

Cows need extra feed, or they will fall off in milk. Corn, or other green fodder, should be given them daily in addition to their pasture. Carbolic soap-suds left to dry upon their legs, will keep flies at a distance. Three hours at noon in a cool, clean stable will be a grateful change for them from a hot, unshaded pasture.

Calves may be turned into a good clover aftermath, or a wheat-stubble, if the young clover is thrifty. Half an ounce of salt daily will prevent bloat. If they can get skimmed, or even sour milk, until six months old, they will be the better for it.

Sheep.—Lambs should now be weaned, the rams separated from the flock, and put in a field by themselves. A little extra feed may be given to the rams. The lambs should have a handful of

mixed bran and oil-cake daily. They will be more contented if put in a field out of sight of the ewes. The ewes should be looked after daily, and those with full bags should be eased of a portion of the milk. This should be done every night, until they are dried off. Ewes, which are the best nurses, may be put with the rams for early lambs in January. Look out for ticks and the fly maggot in spots accidentally bruised, or where filth gathers. Tar smeared upon the noses will keep away the gad-fly. Above all things, keep sheep out of wet, marshy pastures.

Swine.—This is a critical time for hogs where cholera is frequent. Furnish those at pasture with shade and plenty of clean water. Give them a little salt (about an ounce each) daily. Watch for the first sign of sleepiness and a desire to hide in quiet places by themselves. When this is seen, pen up the hog, and give 4 ounces of salt, and soft food with some linseed meal. Store hogs may be penned for fattening. One pound of corn now is worth two in November. Besides, every rod they run about uses up fat. Boars should be kept from the sows, unless pigs are wanted to come in Dec.

Poultry.—Vermin increase fast at this season. No fowls will thrive if kept in close, filthy quarters, where lice abound. A coat of hot lime-wash, with an ounce of carbolic acid dissolved in it, will free the roost from lice. Clear out all the droppings, and spread them evenly in the compost heap. As the old fowls get fat upon the stubbles and in the straw yard, they should be sold off or used in the kitchen. A stewed fowl is more wholesome food than fried pork at this season. To give fowls the run of the barn is a wasteful practice.

Sundry Matters.—If there is no insurance upon the barn, one should be procured without delay. The vapor from a barnful of new hay or grain is one of the best conductors of lightning. Bathe the whole body with cold water every night, and rub briskly with a dry towel. This brings refreshing sleep, and conduces to health. Give the men and boys a bucket with soap and towels, that they may do the same. They will work the better for it.

Work in the Horticultural Departments.

August brings a short breathing spell to the gardener, if he has been diligent in the killing of weeds. If there are in the garden or orchard, any corners and neglected spots, where the weeds are allowed to grow and ripen their seed, these spots will furnish a bountiful supply of weed seeds for perpetuating the crop, so that the quantity is not perceptibly diminished year by year, as it should be. These corners ought to have a thorough clearing out, and not a weed allowed to ripen its seed. This will be a great aid in keeping the place in order. If the work is well along now, a few days of rest and quiet, either in the mountains or at the seashore, will be appreciated by all hands, or even a day's picnic in a cool grove will give them a pleasant change.

Orchard and Nursery.

For trees that were planted in the spring, the present month will be a trying one, and unless they were properly mulched, many will not survive the hot, dry weather. No danger need be feared if a thick layer of hay or straw, corn-stalks, or other material, has been placed around each tree, as this will keep the ground constantly cool and moist, and also prevent the growth of weeds.

Marketing will engage the attention of most fruit growers this month, and everything ought to be in readiness for carrying it on rapidly. Baskets, crates, barrels, or whatever is used should be provided in sufficient quantity, so that no time need be lost for want of them. See that the packing is done carefully, so that the fruit will not be unnecessarily bruised in transportation. Try to gain a good name for quality, this will always sell the fruit, even during times of plenty, for most buyers will pay more for a first class article, than for a poor one.

Weeds.—There need be no trouble from weeds if they are not neglected; a horse and cultivator between the rows of the larger trees and shrubs, and a hand cultivator among the small plants and seedlings, will be found amply sufficient.

Insects will infest the fruit trees in many sections at this season of the year, and they ought not to be neglected. Much immature fruit will fall, and this on examination will be found to contain insects; this fruit should be given to the pigs, or if convenient allow the pigs the run of the orchard. Destroy the nests of the late web-worms as soon as they appear, else they will soon eat up the entire foliage; the best method is to take out the nest by hand, or if neglected so long that they spread, cut and burn the infested branches.

Budding may be performed whenever the bark will lift readily, and well-ripened buds can be had. The maturity of the buds may be hastened by pinching the ends of the shoots on which they are borne. When sticks of buds are taken, cut off the leaves, and leave the leaf-stalk attached to the twig; keep the twigs moist until used.

Fruit Garden.

The same directions as to picking and marketing fruit, apply as well here as in the orchard. All surplus fruit should be dried or canned.

Dwarf Trees.—Pick off all deformed fruit, and also thin out where too thick.

Grapes.—Use sulphur as soon as mildew appears. Tie the vines to trellises or stakes.

Blackberries.—Allow only three or four canes to grow, and pinch these off as soon as they reach a height of five or six feet, and stop the laterals when eighteen inches long. Allow the fruit to remain on until thoroughly ripe when for family use; for marketing pick before fully ripe.

Raspberries.—Cut out the old fruiting canes as soon as they have finished bearing, and apply a dressing of manure, forked in between the rows.

Strawberries.—The latter part of this month is a good time to plant new beds, if the plants can be watered and shaded. Remove the mulch from the old beds, and take out all weeds, and cut off all runners not needed for forming new plants. The best manure for newly planted beds is either wood-ashes, or ground bone raked in, if stable manure is used it should be well rotted, or else it will bring in an abundance of weeds.

Kitchen Garden.

Asparagus must not be neglected, as often happens, through the pressure of other work. If the bed is allowed to become weedy, the next year's crop will be injured. Hoe frequently to kill the weeds and keep the soil light.

Beans.—Although rather late for a crop, a few may be planted for late snaps or for salting. Keep the pole and bush sorts well hoed and weeded.

Cabbages and Cauliflowers.—Hoe frequently, and as often as possible, in the early morning when the dew is on. Apply liquid manure as often as convenient, it will help their growth wonderfully during this hot dry month.

Carrots.—Cultivate between the rows until the tops cover the ground; hand-weed the rows when the weeds appear. Thin out the late sowings.

Celery.—Prepare the land, and set out the plants the middle or last of this month, for winter use. The winter crop should be earthed up and the ground well cultivated.

Corn.—Keep the weeds down by cultivation and pull the large ones from the rows by hand. Cut off and burn all smutty ears. The stalks of earliest varieties, from which the ears have been picked, should be cut for fodder, and the ground sowed to late turnips.

Cucumbers.—Gather for pickles every day; the small ones, not over two or three inches long, make the best pickles. The over-grown ones may be made into cucumber catsup, for winter use.

Egg Plants.—The warm weather of this month is

best suited to the growth of these, and they will be benefited by a few applications of liquid manure. Place a handful of hay or straw around each plant, to keep the fruit from touching the ground.

Melons and Squashes.—Cultivate until the vines cover the ground, and pinch back the ends if disposed to run to vine.

Onions may be harvested as soon as a majority of the tops fall down. Pull and allow to dry for several days before storing; keep in a dry airy place, spreading in thin layers, so that they will not heat. Store sets in the same way.

Spinach.—Sow the last of the month, for fall use.

Sweet Potatoes ought to be growing rapidly at this season. Keep the ridges free from weeds, until the vines cover the ground; move occasionally to prevent them from taking root.

Tomatoes.—Keep tied up to trellises, or place brush or hay around them to keep the fruit from touching the ground. Kill the green worm.

Turnips may be sown in spots where potatoes, peas, and other early vegetables have been taken off.

Weeds.—The best and only rule in destroying weeds, here as well as everywhere, is to hoe or cultivate them up, just as they show their heads above ground. After a rain the cultivator should be started, as the moisture will bring up a plenty.

Flower Garden and Lawn.

The warm weather of the preceding month has started weeds into luxuriant growth, and if they are not pulled up, the beds will soon be overrun. A narrow iron rake makes the best implement to work with in a flower bed where the plants are set out at irregular distances.

Do.—Where this is used for edging, this month is the time for clipping.

Lawns should be mowed as often as necessary, just enough to keep the grass short and velvety.

Climbers.—Tie up neatly to stakes, trellises, or whatever else is used for supports.

Edgings need a good deal of care to keep them looking well. Cut the margins with a sharp turf knife, and keep the grass cut close.

Dahlia, Old'rose, and other plants requiring stakes, should have them at once, before they get so high that they are broken by the wind.

Planted Plants in tubs or pots set on the lawn for decoration, need to be watered often.

Perennials.—Prepare a bed of fine soil, where seeds can be sown as fast as they ripen; keep well watered and weeded.

Greenhouse and Window Plants.

Give hanging baskets and window boxes plenty of water and shade, the latter during the middle of the day. See that the greenhouse is kept clear of insects, the tendency being to neglect this during the heat of summer. Make all necessary repairs now, so that everything will be ready for use at a minute's notice. Provide plenty of pots, sand, moss, and potting soil, for use during the fall and winter.

Commercial Matters—Market Prices.

The following condensed, comprehensive tables, carefully prepared especially for the American Agriculturist, from our daily record during the year, show at a glance the transactions for the month ending July 11th, 1874, and for the corresponding month last year:

Table with 2 main sections: 1. TRANSACTIONS AT THE NEW YORK MARKETS. 2. Comparison with same period at this time last year. Columns include Receipts, Flour, Wheat, Corn, Rye, Barley, Oats, and Sales.

Stock of grain in store at New York. Table with columns for Wheat, Corn, Rye, Barley, Oats, and Malts. Includes sub-sections for Exports from New York and Receipts at head of tide-water at Albany.

CURRENT WHOLESALE PRICES. Table listing prices for various commodities like Flour, Wheat, Corn, Rye, Barley, Oats, Peas, Beans, etc., with columns for current prices and prices from June 12th and July 11th.

Gold has been up to 112 1/2 and down to 109 1/2—closing July 11th at 110 as against 111 on June 12th. Breadstuffs have been quite active since our last; but under the influence of very heavy receipts from the interior, and favorable crop reports, prices have been seriously depressed and unsettled.

ton has been quoted lower, on a lighter business, mostly speculative. Provisions have been in brisk request, especially hog products, which have been purchased freely on speculative account. Wool has been in much better demand, and generally firm as to values, with unexpectedly high prices ruling in the interior, partly through speculative operations. Hay, Hops and Seeds have been quiet, and somewhat irregular in price. Tobacco has been more sought after at rather higher quotations. Kentucky having been especially brisk, in view of the less favorable crop reports. Eggs have advanced materially, influenced by the lighter offerings, and the more active demand.

New York Live-Stock Markets.

Table showing Receipts and Week Ending for various live stock categories: Beef Cattle, Sheep, Swine, etc.

Beef Cattle.—The course of the market for the past month has been downwards. A large increased supply, chiefly of poor lots, weakened the market early in the month, and the light demand consequent upon the hot weather for two weeks finally broke down prices July 1 cent a pound. Large offerings have been the rule up to last Monday, when a reduction of 2,300 head from the previous week stiffened prices, and made an active market. Prices of ordinary stock advanced most, and a gain of a cent per pound was made. Extra stock advanced 1/4 to 1/2 cent per pound. At the close, common to prime native steers and oxen were sold at 10 1/2 to 12 1/2 c. to dress 56 to 58 lbs. to the gross cwt; extra and fancy do. at 12 1/2 to 13 c. to dress 58 lbs.; and poor through Texans to good Northern corn-fed do., from 7 1/2 c. to dress 54 lbs., up to 10 1/2 c., to dress 57 lbs.

Table showing prices for the past four weeks for various live stock categories: Beef Cattle, Sheep, Swine, etc.

The managers of the three main railroad lines that supply this market with live stock, viz: the New York Central, Erie, and Pennsylvania Central, have arranged to advance and pool live stock freights from the West, and the new schedule is as follows:

Table showing rates for various live stock categories: Beef Cattle, Sheep, Swine, etc., with columns for From Chicago to New York, From Chicago to Philadelphia, etc.

It is understood and agreed that the rates shall be uniform and equal to all parties over either and all of the roads; that there shall be no rebates or drawbacks, and no free passes for shippers or agents.

Milk Cows have been in light demand, and in moderate supply. All that were offered found buyers at \$40 to \$70 per head. Calves.—The market for calves has ruled steady throughout the month, and closes fair with prices a fraction lower than last week. Grass calves are now coming in, and bring 40 to 50 c. per lb. Ordinary to good veals are selling freely at 7c. to 9c. per lb. Sheep and Lambs.—There has been a quick sale for sheep at good prices, and 4 1/2 c. to 6 1/4 c. per lb. is readily paid for fair to good. Choice lots sold at the close at 6 1/2 c. to 6 3/4 c. per lb. The large number of Kentucky and Canada lambs offered, weakened the market for this stock, and sales were slow at the close at 6 1/2 c. to 9 1/4 c. per lb., with 10c. for a few extra lots. Swine.—There have been no live hogs offered the past four weeks. All arrivals have been consigned direct to slaughterers. Dressed hogs have been advancing, and were firm at the close of the market at 8 1/2 c. to 8 3/4 c. per lb.

Sheep Raising in Nebraska.—M. Meyers, Gage Co. Neb., sends us the following report of his business last year, the fourth in which he has been shepherding in that State. He had 1000 sheep worth \$3,500 at the commencement of the year. His expenses were \$300 for 100 tons of hay; \$100 for 500 bushels of oats in the shed; wages \$250; washing and shearing sheep \$200; salt \$35; cost of shed \$50; 20 sheep lost \$70; total \$1,035. Produce 4,500 lbs. of wool \$1,800; 400 lambs worth \$1,000; total \$2,800. He considers it safe to look for a profit of 50 per cent in sheep raising in Nebraska.

SPECIAL PREMIUMS STILL OFFERED.

MULNUM IN PARVO KNIFE, OPEN—WEIGHT 2 OZ.

The General Premium List closed July 1st. The following Special Premiums are continued until further notice:

The Mulnum in Parvo Knife for 8 subscribers to *American Agriculturist* at \$1.50 each a year. (Knife sent post-paid.)

The Beckwith Improved \$12 Sewing-Machine for 10 subscribers to *American Agriculturist* at \$1.50 each a year.

The Beckwith Portable Family Sewing-Machine, price \$20, for 30 subscribers to *American Agriculturist* at \$1.50 each a year.

BECKWITH PORTABLE \$20 SEWING-MACHINE.

To secure the Chromo, mounted and prepaid, 25 cents must be remitted with each subscription for *American Agriculturist*.

N. B.—Two half-year subscribers in all the above cases may count for one full year in a Premium Club List.

Please tell your Friends
THAT THEY CAN SECURE THE
AMERICAN AGRICULTURIST
Six Months for only 75 Cts.

In order to enable many persons to become acquainted with this valuable Journal, who have not hitherto taken it, the Publishers will receive subscriptions for it for the

months commencing with July and ending with December, 1874, at seventy-five cents each. Will not each of our present subscribers speak "a good word" to friend or neighbor?—Please note: We will send the *American Agriculturist* for six months, beginning with July, 1874, for seventy-five cents. This offer, of course, does not include the beautiful chromo "Up for Repairs," which is offered to all yearly subscribers free, when taken at 245 Broadway, or twenty-five cents extra when sent prepaid. Give the paper a six month's trial trip, or better still, try it a year.

... P. S. ...

Better Still!
BEAUTIFUL \$5 CHROMO,
AND
Half a Year's Subscription,
ALL
For a Single Dollar.

Considering the hardness of the times, and in order to meet the wishes of a great number who desire to have our beautiful chromo, "**UP FOR REPAIRS**," but who did not feel able to pay the \$1.75 required to get it, the Publishers have decided to send the *American Agriculturist*, from July 1st to the end of the year, and to deliver, free of postage, a mounted copy of this beautiful **Chromo**, which has given so much pleasure, all for \$1, if promptly called for.

Please make this known to all your friends and neighbors.

containing a great variety of Items, including many good Hints and Suggestions which we throw into smaller type and condensed form, for want of space elsewhere.

Remitting Money: — Checks on New York City Banks or Bankers are best for large sums; make payable to the order of **Orange Judd Company. Post-Office Money Orders** for \$50 or less, are cheap and safe also. When these are not obtainable, register letters, affixing stamps for postage and registry; put in the money and seal the letter in the presence of the postmaster, and take his receipt for it. Money sent in the above three methods is safe against loss.

N. B.—The New Postage Law.—On account of the new postal law, which requires pre-payment of postage by the publishers, after January 1st, 1875, each subscriber, whose subscription runs over into the next year, must remit, in addition to the regular rates, one cent for each month over which his subscription extends in 1875, or ten cents for the whole year 1875. Every subscriber, whether coming singly, or in clubs at club rates, will be particular to send to this office postage as above, that is, at the rate of ten cents for the year, additional to the regular subscription. Subscribers in British America will continue to send postage as heretofore, for pre-payment here.

Bound Copies of Volume Thirty-two are now ready. Price, \$2, at our office; or \$2.50 each, if sent by mail. Any of the last seventeen volumes (16 to 32) will also be forwarded at same price. Sets of numbers sent to our office will be neatly bound in our regular style, at 75 cents per vol. (50 cents extra, if returned by mail.) Missi. numbers supplied at 12 cents each.

Our Western Office.—Our friends in the West are reminded that we have an office at Lakeside Building, Chicago, Ill., in charge of Mr. W. H.

Busbey. Subscriptions to *American Agriculturist* are taken there, and sample copies of the paper and chromo are delivered, and orders received for advertising on the same terms as in New York. All our books are on sale at the Western Office. Please call and examine, buy, subscribe, and advertise.

Catalogues and Reports.—Several of these must wait until another month, as our crowded columns will not allow us to do justice to them.

"The Acrobats."—Look at the figures of Crandall's Acrobats, on pages 316 and 317, the most amusing toys ever invented for children. A good laugh now and then, never hurts fathers and mothers any more than it hurts boys and girls.

About Manuscripts.—It has been decided in law that an editor or publisher is not responsible for a manuscript sent to him without solicitation. The English papers, and some of the New York dailies, give notice that no manuscripts will be returned. This rule is no doubt necessary in a daily, but as far as we are concerned, we endeavor to return unaccepted articles when stamps are sent for that purpose, but it is a little too much to expect us to pay 20 or 30 cts., for reading an article that we do not want—still some are so inconsiderate as to require this.

Nameless People.—We have said in almost every issue that anonymous letters would not be answered, and that matters of interest to the writer only, could not take up space in the paper. If "A Farmer's Boy that is fond of work and pleasure," had taken half the space required for that signature, to write his own, we should have sent him a catalogue of the machine he wants. As it is, his letter goes to the waste basket. The "boy" should learn while young that it is impolite to write any one an anonymous letter upon any subject whatever.... "Subscriber" in Suffolk Co., N. Y., can get our Onion pamphlet for 20c., but under our rules we can not answer his other matters. AGAIN we repeat, "sign your name." It will not be published if another signature is used with it, or a line is drawn across it.

Grasshoppers in Minnesota.—A serious calamity has befallen several of the newer counties of Minnesota; they have been visited by grasshoppers, in such quantities as to completely lay bare large districts, and by eating up every green thing, have brought much suffering, and even ruin in their train. Those who have never seen a district that has been devastated by this scourge, can form no idea of the completeness of the destruction. So sudden, severe, and wide spread has been this affliction that the Governor of the State has called for aid, both from the residents of Minnesota and from others. It is expected that the Patrons of Husbandry will extend some relief through their organization, but there will be plenty of opportunity for the exercise of benevolence by others. Food, or the money to purchase it, is the pressing want. Though the severity of the calamity will have been relieved, by the time this reaches our readers, there will still be a great need of food and seed for next season. Contributions may be sent to Gov. C. K. Davis, or Gen. H. H. Sibley, St. Paul.

Other Basket Items on page 315.

SUNDRY HUMBUGS.—The honesty of farmers as a class is proverbial, and being simple-hearted and honest themselves, they are slow to suspect others of dishonesty or wrong intent. Hence it is that humbugs and swindlers of all kinds find their most numerous dupes among agricultural communities, and a list of the names of the well-to-do farmers in every thriving section of the country is something that these sharpers are willing to pay well for. And circulars of all kinds, from those of counterfeit money vendors to the latest quack-medicine maker, find their way to the post-offices in every rural district. Besides these general humbugs, there is a class relating particularly to matters connected with farming, which we may class as

AGRICULTURAL HUMBUGS.

We have exposed from time to time the tricks of the rascally vendors, who sell farm-machinery, and take notes which are so ingeniously worded, that the buyer finds his name affixed to a very different document from that he supposed he had signed. One of the minor annoyances, not only to farmers, but to every one who lives in the country, are

THE LIGHTNING-ROD MEN.

These glib-tongued fellows delight to find only women at the house, for they think they can soon so work upon their fears, as to make them feel that their safety not only depends upon having a lightning-rod, but the par-

icular style offered by that vender. It is often difficult for a man to get rid of one of these fellows, and it is seldom that a woman is sufficiently resolute to clear him out. A lightning-rod, properly put up, is no doubt a protection, and the simpler this, the better. All these twisted and fanciful styles, insulations, and complicated points are useless, if not worse. Platinum points can be obtained in any large city, and if one chooses he can put up a rod himself, without the aid of others. Some of these lightning-rod fellows are not only nuisances, but swindlers, and make the job cost much more than the estimate. We have received numerous complaints of this kind. The following comes from Baltimore Co., Md.:

"I enclose a card representing a lightning-rod company; they have been operating in this county in the following manner: A salesman precedes the wagon, stating that they are selling on a different plan from other companies, that is, so much a set, (\$17.50 per set of 40 feet); the next day an agent with the wagon and a workman comes along, and after putting up about 100 feet of rods and two points, they modestly present their bill in the following form: 100 feet, @ 42¢ per foot, two points, @ \$3 a piece, two supports, @ \$1 a piece. One thing is certain, if they stay much longer about here, they will be 'rodded' themselves."

In all such cases agree upon the amount of work to be done, and the price beforehand, and don't be bullied into paying any more. . . . Every farmer and breeder of animals would be very glad if he were able to produce male or female progeny at will. A chap in Brooklyn has advertised that this could be done, and offered to send the secret for the moderate sum of \$1. One of our friends sent the dollar, and received, written on half a sheet of note paper, the following: "It has been discovered in Germany, that if you give the male at the first signs of heat, you will produce females, and if at the end of heat, males. This plan was tried by Prof. Thoy, and has always succeeded. Yours, J. L. Clark."—Now this was "discovered" we can not tell how long ago, but quite long enough for its fallacy to be proved, and as it was published in all the agricultural papers of the day, we consider the selling of this, which is no secret at all, as a first-class agricultural humbug. . . . While we are always ready to denounce any fraudulent attempts by persons pretending to have patented articles, that have been long in use, or otherwise not patentable, we do not see how we can help our correspondent in Buchanan Co., Iowa. If the claimant has a patent for the clevis, the law is on his side, and from what we at present know of the case, we should advise those who have infringed, to compromise the matter. . . . Letters continue to come in relation to the

CHEAP SEWING MACHINES.

We have in several previous numbers said all that is necessary about these. We need only add that we continue to receive complaints of a concern in Canal st., and advise extreme caution. Here is now the "Hope Manufacturing Co.," advertising a \$5 machine in the Western papers; the publishers send their little bills, and get no money for advertising. As the "Hope Manufacturing Co.," give neither street nor number, we think it a very good concern to be shy of. People engaged in a straight forward business, like to have their whereabouts known, and the withholding of it is sufficient ground for suspicion. . . . The non-explosive-anti-chimney-breaking-powder man, has been to Seneca Falls, N. Y., he tried his little game in a family where the *Agriculturist* is read, and all that he made was the privilege of paying for a broken chimney.

A DANGEROUS HOTEL.

We advise strangers not to go to the Arcade Hotel, even if they can find such a place. Another death has taken place there. This time it was one Michaux; Callinwater, landlord, wrote to surviving friends in N. C., and the whole story as given in these columns in June last, was repeated. Is it possible that so transparent a trick as this can catch anyone?

THE DEALERS IN "QUEER,"

Those who are called who offer counterfeit money, have presented so little novelty that we have not given them much attention of late. Their business must have diminished greatly, since they are by law deprived of the use of the mails; besides this, other papers have at last taken the matter up, and exposure has been so thorough, that only the foolishly wicked can be caught in the trap. We have at last two new circulars instead of the old form that became so monotonous. B. M. O'Neill, who is one of the hundred or more engravers, who were in the employ of the U. S. Government for ten years, and "superintended the engraving of all the plates for the United States money," prints from plates he has engraved since, but he is quite beaten by J. D. Falkman & Co., who offer "greenbacks struck off from the original plates, which were supposed to have been destroyed" . . . A good honest soul in one of the Southern States received one of these "confidential circulars," and being horrified at the iniquity of the thing, devised a plan by which he proposed that we could, with the aid of a detective, catch the man who sent the circular. In the innocence of his

heart he supposed that the sending of such a circular would be sufficient to lead to punishment if it could be proven. But nothing short of the possession of counterfeit money would lead to conviction, and that these chaps take good care not to have. As we have said before, in all this offering there is probably not a counterfeit bill at the bottom of it. The fellows offer to send the *queer* by express; they may send a box of old paper, saw dust, or some such stuff in return for the money, but no counterfeit bills. They are too shrewd to have anything to do with such dangerous stuff. They know that the fool who has sent \$25 in good money in the hope of getting \$200 of counterfeit, will not dare to "sneak," as he will then show that he was ready to become a partner in a felony. They must now and then come across a weak minded, or really dishonest, avaricious chap, who will bite at their bait, or the thing would not be kept up even at its present slow rate. We should judge that there are not five of these circulars sent out now, where there were a hundred before the passage of the law, excluding them from the mails.

MEDICAL MEDLEY.

A subscriber in Conn., seems surprised to see quack medicine advertised in a religious paper! We regret to say that religious papers as a class, are the most active agents in the spread of quackery, and we frequently see advertisements in them that even the city dailies, which are not at all careful in such matters, would hesitate to publish. These dealers in quack medicines are well aware that not one reader in a thousand, knows how little the editors of these papers have to do with their management. As a rule the publishers of these papers pay less regard to the character of their advertisements than any others, but the editors are not responsible for this. It is an unfortunate state of things, and the only remedy we can suggest, is for the readers of these papers to inform the publishers, that unless they reform their ways the paper will lose patronage. If the publishers can be shown that it is to their pecuniary interest to leave out this vile quackery, they will do it, but no appeal other than to their pockets, is likely to have any effect. . . . "Uncasville." It is very kind that "Preacher of the Gospel" to offer to send the prescription which cured his son of consumption. It is one of the oldest of tricks, and has been frequently exposed. The prescription will be found to contain ingredients, which can not be obtained in "a proper degree of purity" if at all, at the drug stores, and the advertiser, taking pity on suffering humanity, has at great trouble and expense procured the right stuff, which he will furnish "at cost," which is usually anywhere from \$2 to \$5. This is very old and stale, but must bring in some dollars or these "retired physicians" and "returned missionaries" would not keep at it. . . . The makers of "eye-cups" are industriously advertising them, and we are surprised to see that the horticultural magazines, which have usually kept very free from all doubtful advertisements, publish eye-cups, lotteries, and dubious sewing machines. These eye-cups are appliances, which pretend to change the convexity of the eye. Now admitting that they could do this, but very few troubles of the eye depend upon any mechanical defect, and the use of these cups may prove highly injurious. We repeat our caution, do not tamper with your eyes either by using these, or in any other manner. . . . In looking over the stock of humbug-literature that accumulates every month, we now and then come across an old customer, that has been disposed of years ago; we were quite amused to find this month an inquiry about E. P. Huyler and his "Wine of Apocynum." Our friend H. T. H. will find the question "What of him?" sufficiently answered in these columns in December last. He is the same as "Old Mother Noble," and is the "Electric Health Restorer" man, also the Dr. Clark of "Indian Blood Syrup" notoriety, and we know not what besides. . . . By the way, we notice that "C. Johnson, M.D." is sending out threatening letters by his lawyers. But then the man at the bottom of this Indian Blood business is E. P. H. . . . With all these things of greater or less antiquity, it is refreshing to have now and then a

"MEDICAL" NOVELTY.

Once in a while we can get a laugh, as out of Dr. Churchill's "Restorative Remedies," for which a Cincinnati house, calling themselves chemists, send out prescriptions, and say how they are prepared, but as "unprincipled druggists" "never prepare according to our method of preparing," all the patient can do is to send to the Cincinnati house, and get the genuine thing. As one of the directions is to "heat on a slow fire in a covered vessel to 100 degrees specific gravity," it is no wonder that "unprincipled druggists" fail. Yet these chaps call themselves "Pharmaceutical Chemists." . . . But the richest thing of late is the pamphlet, setting forth the virtue of Dr. J. R. B. McClintock's "Dandelion Anti-Bilious Pills and Bitters." We thought the narrative of our beloved Ned Eastman was some, but that is as much behind Mc's pamphlet, as a Comanche Indian is inferior

to a Philadelphia quack-doctor. This Dandelion stuff is nothing short of the very thing with which "the emperor, his family, and his poorest subjects" are physiced. Why was Alexis, when he visited us, so attractive to American ladies? Why was the Emperor's daughter so lovely that the Duke of Edinburgh chose her to be his duchess?—This pamphlet does not say so, but we haven't the least doubt, that it was all due to Dandelion. It happened in this way, Doctor Mac "had heard of the great reputation acquired by Dr. Micheleleski, the chief physician of the Emperor Nicholas, from his wonderful cures by the use of a preparation of Dandelion, the composition of which was only known to himself." Now while there is the best College of Pharmacy in the country, and one of the oldest and best medical schools in Philadelphia, there was no one there who could get the "virtues" out of a Dandelion root, so McClintock J. R. B. sent all the way to Russia, to find how to do it. The account of his friend, Dr. G.'s visit to Russia, and his interview with old Micheleleski, is just touching. The Dandelion cures people who have been knotted, and the accounts of the whipping of women, and "pictures to match," are justly styled thrilling. Indeed, the account of this medicine is one of the choicest specimens in its class of literature, and while the engravings of licking and hand-cuffing half-naked women do great credit to the Philadelphia artist who designed them, we think that the picture of Dr. Micheleleski, drinking "the health of Dr. McClintock in Dandelion Bitters," is a masterpiece. The whole thing is very funny, and as to the virtues of the stuff, if there is any disease that this won't cure, if we believe the pamphlet, it must be a something we shouldn't like to have. Take this pamphlet, and the lithographed appeal to agents together, and they form gems in our collection of humbug literature, with which we would not willingly part. And yet, sad to say, there are even in this day of free schools and general intelligence, persons who will believe this balderdash, and what is worse, spend their money for stuff thus ridiculously set forth. J. R. B. McClintock may go to the head.

The Practical Farmer, published in Philadelphia, by Paschal Morris & Son, is now the only agricultural paper in Pennsylvania, it having absorbed the *Journal of the Farm*, published by Daniel Baugh.

The Death of Mr. Olm.—M. Olm, of the senior of the firm of Olm Bros., florists, Newark, N. J., met with a very sad and sudden death on Sunday, June 28th, as he was about to take his family to church. His brother, who was at a distance, saw him upon the ground holding the reins and trying to check the horse, which had taken fright from some cause; by the time his brother could reach him, Mr. Olm was senseless, the foot of the horse having struck him a blow upon the head, which caused his death in a few minutes. The children, who were in the wagon, were injured, but not seriously. Mr. Olm was about 45 years old at the time of his death. He was born at Luxembourg, and came to this country about 1860, having abroad acquired a high reputation for the tasteful arrangement and management of grounds. For a few years after his arrival he was gardener for Mr. Judd; he was also with Messrs. Parsons & Co., of Flushing. He afterwards established himself with his brother at Springfield, Mass., and when land became too valuable for gardening purposes, they sold out and removed to Newark. His sudden death occurred just as the new establishment was fairly in working condition.

Wool Waste for Manure.—Our correspondent, "G. P. D.," Philadelphia, who kindly furnished the information as to the value of wool waste as manure, again writes that the waste was used upon about 18 acres of land, and that the present season the crops growing upon the 18 acres, including the grass, are looking "tip top," and that he is satisfied that wool waste is an excellent manure. (Being rich in potash and nitrogen, it is a fertilizer of too great a value to go to waste.)

The Wisconsin Rail-Road Decision.—The recent decision that the Legislatures which charter rail-roads, have the right to make laws to govern their charges for transportation, has occasioned much comment. While some look to it as a step toward abolishing exorbitant charges for the transportation of produce, others regard it as a death-blow to further rail-road development in the State, and that the people of Wisconsin must content themselves with the facilities they already have, as capitalists will not invest in rail-roads, while the present laws are in force. The case goes to a higher court for affirmation or otherwise, and the decision is not regarded as final. In the meantime if the managers of the roads, and those who make use of them, can be made to see that their interests are identical, and that the matter had better be settled at once, as it will ultimately be, with a regard to the rights of all parties.

The Patrons of Husbandry in Ohio have availed themselves of the general corporation laws of the State, and stand on the records as a regularly incorporated body, "The Ohio State Grange of the Patrons of Husbandry, for the promotion of agriculture and the mutual benefit of those engaged in the purchase and sale of stock, commodities and articles pertaining thereto, including household luxuries." This places the State Order on the business footing of other corporate bodies.

The Swiss Colony, which located in the Tennessee mountain region six years ago, has made a fair record as an agricultural community. There are in the colony 325 inhabitants, living in 78 houses. They have 7,600 fruit trees, 4,700 grape vines, and till about 1,000 acres of land. They have two schools, and have established an Agricultural Society. The growth is not like that of communities on Prairie railroads, but it is growth, nevertheless.

A Colorado Sheep Farm.—Mr. John Sheldon, of late a large sheep farmer of New York State, has commenced sheep farming in Larimer Co., Colorado. He has 500 acres of land, upon which he has made an artificial lake of 40 acres, which he has surrounded with planted shade-trees. He has already brought three carloads of pure Merino sheep to the farm. The celebrated ram "Dictator," which has yielded 26 lbs. of wool at a shearing, is at the head of his flock. Mr. Sheldon proposes to put 10,000 Mexican ewes upon the range.

Crop Prospects.—Advices from the great corn-growing States of the West represent that, although there were many interruptions to corn-planting in May, the seed went into the ground in good time, and under circumstances ordinarily favorable. Letters received as late as May 29th, report favorably as to winter and spring wheat prospects, and enthusiastically as to fruit prospects.

St. Joseph and Denver City R.R. Bonds.—Those of our readers, who hold any of the above bonds, are informed that the U. S. Court, held at Leavenworth, Kansas, has appointed a "special master" to report the amount of interest due and unpaid. In order that this may be done, the bonds and unpaid coupons should be deposited at once with The Farmers' Trust and Loan Co., the trustees under the mortgage, at 26 Exchange Place, New York. As soon as the deposit has been made, measures will be taken to purchase the property for the bond holders.

A Mule with a Colt.—A Pepper, Franklin Co., Ind., writes that a mare mule owned by a neighbor has recently had a horse colt, which it suckles and cares for the same as any other mare would. (Such an occurrence is rare, but happens, occasionally.)

Connecticut State Board of Agriculture.—We have received through Secretary T. S. Gold, the reports of the Connecticut Board of Agriculture for 1873. These reports increase in interest and value year by year. Undiluted by the useless tables of figures usual in such reports, this volume is filled with practical matter; papers and discussions upon matters of every day interest to the farmer, by men who gain their living in the field as well as by those who are eminent for their scientific attainments. It is one of the best of the few agricultural reports which it will pay to procure, to study and to keep for future reference.

The Butter Convention.—The National Convention of Buttermakers and Dealers, met at Indianapolis on the 17th of June. The principal address was made by Mr. D. W. Dake, of Beloit, Wis. We are unable to find space for this valuable address, but it will doubtless be published in full in the final report of the proceedings. It is worthy of careful study. A large number of essays were offered in competition for the premium of \$1,000 liberally offered by Mr. Dake.

How to Use Bones.—"P. A. D.," Lexington, Va. Powdered or crushed bones are useful for any crop. They add to the soil phosphate of lime chiefly, and this is a component part of nearly every vegetable valuable for food. They are of special value for turnips, potatoes and grass.

Tan-bark for Stables.—"P. A. D." Leached tan-bark makes a very clean and cool bedding for horses, but it should be dried before it is used. If used while wet it ferments and heats, and will cause the hair to fall from animals that are bedded with it. At least such has been our experience with it. Sawdust is the cleanest bedding for horses that we know of.

Artificial Ponds.—"F. L. T.," Winnebago Co., Wis. Gold-fish will live in an artificial pond,

if there is plenty of water kept in it, although there may not be a stream running through it. But trout will not. To make such a pond, it is only necessary to dig out the earth and raise a dam to preserve the supply of water. In digging the pond, it is well to make some deep holes in the bottom, and not to have it all the same depth.

Mapes' Superphosphate.—"H. M.," Bergen, N. J. One superphosphate, honestly made, is as good as another. The process is such, that the amount of soluble phosphoric acid is, or should be, about the same in all superphosphates. As regards the above-mentioned fertilizer, we can say that the manufacturer of it, Chas. V. Mapes, has an excellent reputation, and is trustworthy, and that is the main point to be considered in purchasing a fertilizer.

Railway Horse-Powers.—"V. W. K.," Shirland, Ill. There is not much choice as to railway horse-powers when made by reputable makers. The principle involved in their construction is nearly the same in all of them, and the chief point in selecting is strength and excellence of construction. There are several described in the advertising columns, either of which would be desirable machines.

Flatulence in a Horse.—"D. P. M.," Newark, N. J. Flatulence, or the discharge of wind, is a symptom of indigestion. It should be remedied by feeding easily digested food, such as hoiled oats, or scalded cut-feed, with ground oats and bran, and a pound or two of linseed meal. An ounce of salt should be given with each feed. A few carrots, or hoiled potatoes, would also make a useful addition to the feed.

City Street Manure.—"S. F. K.," The sweepings of the streets of towns and cities are mixed with so much earth and rubbish, that their value is much less than good stable manure. But they have the advantage of being free of weeds. The urine, which is so valuable a part of stable manure, is not contained in the street sweepings. At \$11 per cord for stable manure, as usually estimated, street sweepings should not be worth more than \$3. Peter Henderson, an excellent authority, and who has used them extensively, speaks very highly of them for garden purposes.

Hail and Horticulture.—Some of our friends, who live in the northern part of Bergeen Co., N. J., suffered severe loss from the hail-storm of July 4th. The hail-stones were so large as to break not only glass, but sash, and do other damage. Greenhouses were demolished, and fruit-trees not only stripped of their fruit, but their leaves. Unless one has witnessed the effects of such a storm, he can have little idea of the destruction it carries in its path. Several years ago we were at Rochester, just after the nurseries of Ellwanger & Barry had been crossed by one of these hail tornadoes. It was a sad sight. . . . Since making note of the above, we learn that the great Rose Show, announced for July 3rd, at Lyons, France, is postponed until September, on account of a great hail-storm, which injured not only roses, but other vegetation, and destroyed the grape and other crops of a wide region.

Packing Eggs for Hatching.—"L. M. A.," Toledo, Ohio. The best material for packing eggs is oats, and wheat chaff is nearly as good. Finely chopped straw is also a good material, but hay and sawdust are very poor material. The common idea that eggs are injured for hatching by transportation, we do not believe. We have raised a large number of fowls from eggs taken from barrels, in which they were packed with oats for market, and which had traveled over 1,000 miles with rough usage on the way. The losses were inconsiderable.

Death of a Duchess.—The two-year-old heifer, 7th Duchess of Oneida, which was purchased by Mr. A. J. Alexander, of Kentucky, for \$19,000, at the New York Mills sale, last fall, has recently died of pneumonia. This death, with that of the cow 8th Duchess of Oneida, which sold for \$40,000, shows what great risks breeders of this class of stock are willing to run, and that these great prices do not represent all profit.

The Lock Nut and Bolt Co.—"W. W." The address of the manufacturers of the lock nuts and bolts, described in the *Agriculturist* some time ago, is 17 Dey-st., New York. It was formerly 61 Broadway.

Is Flax an Exhaustive Crop?—"N. T. S.," Lincoln, Neb. Flax is considered as an exhausting crop, and justly so, when we know that the seed contains twice as much potash and phosphoric acid, and twice as much nitrogen as wheat, while the straw is still more exhaustive of these valuable constituents of the soil, than wheat straw. A soil that would produce six

successive crops of wheat, will bear only three of flax, even when the straw may be returned to the soil.

Blight—Tiles.—"J. Q. A. M." The blight in fruit trees is still an obscure matter, the sudden death of a tree, or a part of it, being usually the first intimation that there is any trouble. The evidence thus far obtained points to a fungus of some kind as the cause, but as yet very little light has been thrown upon its prevention. . . . Clay that makes good brick, will also serve for making tile.

Value of Sawdust.—"G. R. W.," Boonville, Ind. Fresh oak or green sawdust is worth nothing as manure, in fact, it is not manure at all. It is of the most value when made to absorb the liquids from stables, it then rots very readily, and not only makes a convenient vehicle for the liquid manure, but is of some service itself. If we had a large quantity, which cost nothing, and could be cheaply hauled, we would pile it in large heaps and burn it, and use the ashes. In this way it would be of immediate and considerable value for any crop, but especially for grass.

Pea Bug.—"W. G.," Ottaway, Ill. The beetle deposits its eggs on the very young pod, and the minute grub eats into the pea, feeds, grows, and changes into a beetle; the entrance is so small that the growth of the pod obliterates all marks. Unless all in a neighborhood will agree to plant no buggy seed, we do not know how you can be clear of them.

Indefinite.—"J. R.," Schley Co., Ga. Your question is too indefinite, and had you signed your name, as every one should in writing to any one, especially to editors, you would have had a letter asking explanations, and saved us the trouble of printing this. Will not our friends be kind enough to remember that no merchant, banker, or other person in business does his correspondence by initials, and that business with editors should be done in a business-like manner.

Preserving Eggs.—"J. O. B.," Newark, N. J. The most successful known method of preserving eggs is to smear them evenly with boiled linseed oil and pack them with the small end downwards in plaster of Paris or salt. It is doubtful if they can be kept fresh in large quantities for so long a period as 7 months, although they have been kept 6 months in small quantities.

Preserving Posts.—"R. F. S.," Yellowstone, Wis. It is sufficient if fence posts are soaked in lime water for twenty-four hours, if they have been well seasoned previously. If they are green, forty-eight hours soaking should be given. A convenient way is to have a large hogshhead half full of lime water and fill it with posts standing on their butt ends, and change the posts every day or two days until the whole are soaked.

Poultry or Stock Dealers.—"W. O.," St. Paul, Minn. We can not give the names of dealers in poultry, eggs, or stock for very obvious reasons. The names of parties dealing in these things are to be found in our columns appropriated to such matter, and no person's name is admitted there if we know or have any reason to suspect that he is not trustworthy. Persons who desire to purchase, perhaps could not do better than select those dealers who are most conveniently situated for the purpose.

Yield of Root Crops.—"J. C. P.," New Orleans. A fair crop of mangels would be 600 to 800 bushels, of ruta-bagas about 600 bushels, and of sugar beets 400 to 500 bushels. Much larger crops are frequently raised, and double the quantities mentioned sometimes, but only in rare instances. It is safe to discount reports of unusually large crops of anything.

Hollyhock Disease.—The Hollyhock fanciers in Europe are in trouble. A mould or fungus, *Puccinia malvacearum*, proves exceedingly destructive to the plants. It was first noticed in Bordeaux in April, 1873, since which time it has spread rapidly through France and Germany, and has already appeared in England. The only proposed remedy is to destroy all the plants of the mallow family, hollyhocks included, and give it nothing to feed upon.

Grain Weevils.—"J. C. B.," Allentown, Pa. Barns are not readily freed from weevils on account of the difficulty of reaching all their hiding-places. But granaries are more easily rid of them. The walls and floors should be washed with hoiling water or potash lye, and every crack thoroughly explored with a stiff broom dipped in it. Then the walls should be whitewashed with a thick coat put on while hot. The windows should be covered with fine wire gauze to keep out all insects.

A Lame Colt.—"M. T.," Parma, Mich. A sprain of the shoulder nearly always results in a contraction of the muscles. The depression thus caused, is called by some people "sweeny." It is, however, simply the result of the sprain. If it has been severe, and inflammation of the deeper muscles has occurred, the injury should be attended to at once, by a competent veterinary surgeon. If only superficial, a brisk application of some exciting liniment, with rest, and food of a cooling character, such as bran mash or carrots, might remove the lameness.

Vitality of Eggs.—"T. P. L.," Essex Co., N. J. The vitality of eggs is effected by evaporation, more than by moderate cold or heat. If kept in a dry, warm place, the moisture rapidly escapes through the porous shell, and the egg is spoiled. They may be kept for hatching for a month without injury in a cool cellar, if they are occasionally turned. It is always safer, however, to set only fresh eggs.

Learning to Farm.—"J. W. P.," Pittsburg, Pa. One cannot learn much about farming in less time than a year. The routine of the work on a farm is not complete in less than a year's time. Whether one year or more would be necessary, depends on the aptitude and industry of the student. It would be best for those who want an opportunity of learning the business, to seek a good farmer and pay him for his trouble. It is not of much use to study books until you know what you want to learn. A little experience on a farm will teach that, and then it is an easy matter to get the books which may be needed.

Emigration to Virginia.—"W. A. M.," Windsor, Nova Scotia. There are many favorable points in the Piedmont region of Virginia, for profitable farming. The neighborhood of Charlottesville, has the advantage of good soil and climate, and markets, and the vicinity of a University. It would be well to visit the country before making a determination to move.

Stable Floors.—"A Subscriber since 1845." A stable floor made of cobble stones, cement, and tar, is described in the *Agriculturist* of November, 1873. The size of the stones is immaterial, small ones will make as good a floor as large ones, if the foundation is solid, and they are well rammed down. The ditch behind the cows should not be so deep as 8 or 9 inches; 4 inches is enough and 6 should be the extreme depth. If no cement is used, and only coal tar, the spaces between the stones should be filled with sand, and as much hot tar poured in as the sand will absorb. Then sand should be thrown upon the floor, and rammed down or beaten until it is no longer soft or sticky.

Ground Bones.—"L. E. B.," Toledo, O. Ground bones retail in England, at \$30 to \$45 a ton in gold. The price in New York and other centers of the trade, is about the same in currency.

A Cribbing Horse.—"J. W. G.," South Middleboro, Mass. The only satisfactory method of preventing a horse from cribbing, is to make him wear a muzzle, or remove every thing from the stable that he can lay hold of with his teeth. A muzzle for a cribber was described in the *Agriculturist* for October, 1872, and a movable manger which turns outside of the stall, in November, 1872.

The best Breed of Sheep.—"A. N. T.," Norwalk, Ct. For a good, stony pasture in New England, the Cotswolds would probably be the best sheep for wool and mutton. The grades of this breed grow to a good size, make large early lambs, yield a good carcass of mutton, and have a heavy fleece of a fair quality of combing wool. We consider the grades more profitable to keep than the pure-bred sheep.

Books on Sheep and Horses.—"A. N. T.," Norwalk, Ct. The best book on sheep for general use, is "Morrell's American Shepherd," price \$1.75, although it is old and somewhat out of date. The best horse-book is probably "Stonehenge on the Horse," price \$2.50, (or \$3.50, English edition). Both may be had of the Orange Judd Company.

Value of a Merino Ram.—"J. T. F.," Lincoln, Neb. Whether or not it will pay you to expend \$25 for a pure Merino ram, depends on the quality of the ram and how it is used. If the ram is a good specimen of the breed and over two years old, and is well fed, he will be able to serve at least 50 ewes annually for 5 years. If the produce is such that the fleece is improved in value 10 cents a pound, and in weight but one pound by the first cross, which is probable, the cost of the ram

will be more than repaid by one year's service. The second cross will add more still to the value of the fleece. The value of any pure-bred animal should be calculated in a similar way, and it will be generally found that there is a large margin of profit in the first year's use, without counting the future returns.

A Furnace for Wood.—"W. W.," Clinton Co., Pa. For warming houses in country places, where wood is the only available fuel, the Gothic wood furnace, made by A. M. Lesley, 224 West st., New York, will probably be found the most convenient. It takes wood four feet long, and is of the simplest construction. It may be fixed in the cellar, and obviates the necessity of having stoves throughout the house.

Lands in Eastern Virginia.—"C. F. S.," Guernsey Co., Ohio. By writing to General Imboden, the State Commissioner of Immigration, Richmond, Va., you can get information as to lands for sale, or for colonizing purposes. Considering the large quantities of land for sale, and the number of persons always wanting to purchase, it would be well that those seeking purchasers should do so through our columns.

Devon Herd-Book.—Another volume of the Devon Herd-Book is in course of preparation. Pedigrees for inscription are now being received by the editor, H. M. Sessions, of Wilbraham, Mass.

Gypsum in Virginia.—"G. C.," Swoope's Depot, Va. It would not pay to procure gypsum from New York so well as from your own State. There are large beds of the purest varieties at Wytheville in Southern Virginia, owned and worked by a Mr. Matthews, of that place, from whom a supply could probably be procured at very low rates.

Stone Drains.—"G. W. W.," Bedford Co., Pa. In the *Ogden Farm Papers* for July the subject of stone drains is clearly treated. If stones are plentiful and handy, and tiles can not be procured, there are cases which may be exceptions to the general rule, laid down in the article referred to. A stone drain may be laid so as to be permanently useful, but it very rarely is.

Parrots.—A correspondent in Indiana wishes to know something about the treatment of parrots. If any one knows what to do with "Polly," except to give the often repeated "cracker," which she is supposed continually to "want," let him speak.

The R. I. Society for the Encouragement of Domestic Industry sends us its Transactions for the year 1873. We would especially call attention to a feature, which other societies may profitably adopt—its obituary notices of deceased members. These are remarkably full and accurate, and will in time be of historical value. The Society this year unites with the New England Agricultural Society in a Fair, which will be held at Narragansett Park, near Providence, on the 2d to 4th of Sept. next. This is one of the best fair grounds in the country, and the two societies should present an exhibition, which will draw as many visitors as the abundant means of communication with Providence can carry. The Rhode Island Society is a very old association, but the infusion of young blood has awakened it to renewed usefulness, and it has only to take pity on those who have occasion to write or print its title, and adopt a name that bears some relation to the size of the State to insure its prosperity. "The Rhode Island Industrial Society" would express everything that the present name does, and not exhaust the resources of the printing-office every time it was set up.

The Carpenter's and Builder's Guide, by Peter W. Plummer, is a hand-book for workmen, but is equally useful to any person who, desiring to build, would first sit down and count the cost. It contains forms of builders' contracts, a variety of tables of timber measure and other useful matter. Supplied by the Orange Judd Company, for \$1.00.

Irish Farming.—"An Introduction to Irish Farming," by Thomas Baldwin, Superintendent of the Agricultural Department of National Education in Ireland, has recently been published by Maemilian & Co., New York. It is a useful little hand-book of agriculture, which, although intended to relate more particularly to farming in the moist climate of Ireland, is yet full of information as to the management of soils, manures, crops, and stock, which may be useful to a young farmer anywhere. It is sold for 75 cts., and is worth more money.

Fruits and Vegetables.—"D. R. S. S.," Ohio, revives the question, "are tomatoes fruits or vegetables?" We have said our say on this in previous

years. Botanically speaking, they are fruit. In the seedsman and gardener's view they are vegetables. There is no satisfactory definition of the terms fruit and vegetable as popularly used.

How Books Sow Seeds.—We have frequent evidence of the wide-spread influence of good books on agricultural subjects. Often a single volume, going into a remote neighborhood, carries with it an idea that becomes of more value than would suffice to pay author, printer, and binder, for a whole edition. An instance of this has just come to our notice. A correspondent in Point Pleasant, Mason Co., West Virginia, says: "We have a tile-factory here, on this side of the river, owned by Mr. I. W. Smith, and as it may interest you, I will tell you that he got from you a copy of Waring's 'Draining for Profit and Draining for Health,' and tried a field that was very swampy and wet, to see what tile-draining would do for it. He followed the advice given in the book for laying out the drains, etc. It was such a great success, that he went into the business of making tiles for himself and for his neighbors. He has now more orders than he can fill."—Who shall estimate the benefit done to that neighborhood by this single book, costing a dollar and a half? It has increased the value of that region for all coming time.

Effect of Clover.—"G. R. W.," There is nothing in clover pasture that could prevent a mare from becoming in foal. If she fails to breed, there is some other reason than the nature of the pasture.

Onion Grub.—"O. C. H.," Conn. The small white grub you find at the 2d or 3d weeding is the larva of the onion fly—a serious pest when it is abundant, and one for which no satisfactory remedy has been found. The use of the manure you mention has probably nothing to do with the occurrence of the grub, as it results from an egg deposited by a fly, about half the size of the common house-fly, upon the stem of the plant above, though near the surface of the soil.

A Doubtful Case.—"Enquirer," Marlboro, Mass. We should hesitate to advise a man with a young family, and possessing but \$800, to buy a farm in the East, which is most likely badly run down, for \$3,000, in the expectation of making a living and paying for the farm out of the crops. There are some men who might succeed, but these are very few, and the probabilities are very much against a success. We should also hesitate very much to advise such a person to go West, if he can make a living where he is at a mechanical trade. Although a soldier's homestead can be procured for nothing, yet the care of a young family would be a serious burden in a new unsettled country to a man with such scanty capital. The far West is for enterprising young men without families, or older men with plenty of help, or for persons with money sufficient to carry them over the unproductive period. A worn-out farm in the East requires money and skill to restore it, and skill is a greater necessity and a rarer possession than money.

Sebastopol Geese.—"R. M. C.," Greenville, Tenn. We do not know the address of a breeder of Sebastopol geese. Probably inquiries addressed to some of the poultry breeders, whose names are found in our advertising columns, would elicit the information.

Rye for Winter Pasture.—An instance of the value of rye for early spring pasture comes to us from Kansas. Mr. W. B. Akers, of Douglass Co., needing some early feed for his large stock of mares and colts, sowed 120 acres of rye last fall. In the spring, feed was very scarce, and hay was worth the extreme price for Kansas of \$16 a ton, and corn 75 cents a bushel. The pasture thus fortunately provided saved an otherwise necessary outlay of \$2,500.

Farm Students.—"M. B. W.," Chautauqua Co., N. Y. A farmer who is competent to instruct pupils thoroughly in the art of farming, is not likely to take a young man who desires to learn the business, and pay him good wages. A farmer of our acquaintance, who has always one or two students, and who refuses many applications for more, receives \$300 a year, and the services of his pupils. The pupils are bound also to obey all his orders, and do any farm work, when and where he may require it, just the same as a hired man. This is absolutely necessary, for a farmer, before he can know how to command men, must know how to work himself. In return for the above payment, and their constant and industrious labor, the students receive their board and instruction. It is in fact an apprenticeship for whatever term may be desired, not less than a year.

See Page 313 for other Basket Items.

Improvement in Handling Cotton.

—By a new process, which has been sufficiently tested to show its practicability and value, the seed-cotton may be taken from the field and, without the use of the gin, brought directly to the card. Here a machine known as the Clement attachment, which occupies the position of the usual "licker-in," takes the cotton and cleans it from the seed, dust, trash, and notes, and delivers it in an tangled condition to the card, from which it emerges through the "doffer" in a continuous roll called a "sliver." This improvement in the manufacture of cotton will be of great benefit to the Southern planters, as it makes the use of the gin and the press unnecessary, so soon and so far as the manufacture of yarns direct from the seed-cotton can be established. Then the natural connection between the planter and the spinner will be effected, and instead of the raw material being exported, a partly finished product, the yarn, will be. Mr. F. E. Whitfield, sr., has several of these machines already in successful operation at Corinth, Miss.

State Fair Notes.—As the Ohio State Fair is to be held at Columbus for a number of years, the Board has taken possession of the County Fair Grounds east of the city, has extended them, and is making many permanent improvements. This subject of a place for the Fair has been a matter for heated discussion for ten years, and was settled in favor of location at the State Capitol, at the last winter meeting of the State Agricultural Society. The fair will be held the second week in September—Sept. 7th to 11th, and a special effort will be made by the dominant party, to have the fair all that the legitimate Agricultural Exhibition can be. The Northern Ohio Fair at Cleveland, will be held a week later, partaking more of the character of an Industrial Exposition. An effort is being made to organize a Southern Ohio Fair Association to hold a fair at Dayton.... The Indiana State Fair and Exposition, will open at Indianapolis Sept. 7th, and hold thirty days.... The Illinois State Fair will be held at Peoria, Sept. 14 to 19; Iowa at Keokuk, Sept. 21 to 26; Kansas at Leavenworth, Sept. 7 to 11; Wisconsin at Milwaukee, Sept. 7 to 12; Wisconsin Industrial Association at Mineral Point, Sept. 1 to 4; Minnesota at St. Paul, Sept. 8 to 12; Nebraska at Omaha, Sept. 29 to Oct. 2; Colorado at Denver, Sept. 22 to 26; California at Sacramento, Sept. 21 to 26; Michigan at East Saginaw, Sept. 14 to 19. The Industrial Exposition at Chicago, will open Sept. 9, and continue one month. This was a great success last year, and every effort will be made to have the exhibition excel, this year, in every department. Our Fair List will appear next month as usual, and we ask those Secretaries of State, County and other Societies, who have not sent us their official announcements, to do so as early as possible. It is a very difficult matter to make up an accurate list of fairs, as the papers published in the same county and town, often disagree as to dates. We ask the secretaries to help us make our list as correct as possible.

Ammonia in Peat.—"Lime" Passaic, N. J. The advice of your neighbors as to the best way to use swamp-muck is correct, and that of your city friend is incorrect. Peat contains nitrogen, but does not contain ammonia, either free or in combination with an acid, and it is only such ammonia that is drawn off by lime or potash. Peat-muck applied to a field as driven from the swamp, is of no immediate use, and we have had no visible benefit from a copious dressing of it. But if decomposed by lime, the nitrogen in the peat, which is inert of itself, is slowly changed into ammonia, which remains in the peat, in combination with acids, until absorbed by the soil or used up by the plants to which it is applied. Thus fresh blood, flesh, leather, and other animal substances are rich in nitrogen, but may be mixed with lime without any ammonia, or any smell being given off. But as soon as the nitrogen is changed into ammonia by decomposition, a strong smell is perceived on the admixture of lime or potash. Ammonia consists of one atom of nitrogen, with three of hydrogen, and this combination takes place during the decomposition of substances which contain nitrogen, and are therefore called nitrogenous substances. Peat decomposes slowly, and several months rest in the heap mixed in alternate layers of one load, with one bushel of lime, is necessary to render it fit for use. After that time it becomes fine and spreads easily. Peat thus treated contains ammonia in varying proportions of one per cent or less, up to three per cent.

The Cattle Business in New York.

—A change of great importance to feeders of cattle has gradually taken place in the method of conducting the trade in live stock in New York. The slaughtering business is now in the hands of a few men, and hardly more than a dozen of city retailers kill any beefs, sheep, or calves. The meat they sell is purchased at the large slaughter-houses, or the wholesale meat-market, by the

side, quarter or carcass. The few retail butchers who still purchase their live cattle are gradually changing their methods, and by and by doubtless they will fall into the regular channels of the business. The effect of this is to narrow the competition and prevent sudden fluctuations in prices. A few men can now make the market, and as it is to their interest to keep prices steady, it is to the interest of the country dealers and graziers that this state of things should continue. The prices quoted in the market reports now more nearly represent the actual value of the stock than at any former time, and shippers from the West may be more certain of realizing a fair market price than they could previously do. The concentration of business in a few hands cheapens the cost of handling the stock and the meat, and this saving in cost, of course, comes ultimately either to the producer, or the consumer, or partly to both of them. Fat cattle from the West are subjected, on their arrival here, to a shrinkage of 60 lbs. to the 1,000 lbs. of live weight. They are then sold on an estimate of 57 to 58 lbs. to the gross hundred weight. Beefes, which weigh 1,200 lbs. in Chicago, will thus weigh on their arrival here 1,128 lbs., and will be sold on an estimate of 640 lbs. nett weight.

As to Tile-Drains.—"Subscriber," Waterbury, Conn. The water enters the tiles in drains between the joints. In laying tiles, care should be taken to have the joints as close together as possible, and to cover them with compact soil. The largest portion of the water enters from beneath tiles and at the sides, scarcely any entering from immediately above them. As the flow is a gentle percolation through the joints, there is only a trifling amount of sediment carried in, and to get rid of this, "silt basins" are made in the drains. "Waring's Draining for Profit" explains all this very fully, and should be studied before any thing is done in the way of draining.

"Horse Books."—"M. E.," Walla Walla, W. T. The best book upon horses for general use is probably Stonehenge's "Horse in the Stable and in the Field." Its cost is \$3.50. It may be procured at the office of the Orange Judd Company, 245 Broadway, New York. If a mare does not become in foal after repeated visits to the horse, it is common to bleed her, and reduce her condition by physic and exercise. A run at pasture along with a horse for a few weeks, will frequently lead to the desired result. In such a case the shoes should be removed, to avoid injury.

The Potato-Rot.—"G. W. S.," Mifflin, O. The origin of the potato-rot is a somewhat disputed point, but we know in a great measure how it may be avoided. The crop should be grown only upon well drained, warm land, a light loam with some gravel in it, is the best soil; only well rotted barn-yard manure should be used, or some good superphosphate applied in the hill. Wet clay soils, fresh unfermented animal manures, and a wet season, are productive of rot, and if the first two are avoided, the crop often escapes the effect of the last.

What Part of the West?—"B. B. B.," Greene Co., Ohio. What part of the West is the best for farming or stock raising, depends upon many circumstances. If the emigrant has but little money and much patience and perseverance, he may choose the neighborhood of one of the great railroads, where homesteads are still vacant. Through the Arkansas Valley, along the Aitchison, Topeka, and Santa Fe railroad, the winters are somewhat shorter than in the Platte Valley, upon the Union Pacific and the Burlington and Missouri roads, and there are homesteads far out upon each of these roads. If he has more money, he would do better to purchase lands near towns from any of these roads, but before selecting his home, we would advise him to go and look for himself. The present month would be a favorable time to examine the Western country.

How Drains Act.—"Milo," Telmacana, Texas. The water which runs into drains dug in tough clay soil, enters from the sides and the bottom, and not from immediately above the drains. The toughest clay is sufficiently permeable to water to allow it to pass through readily, and after the drains have been in operation some time, regular and permanent water channels become established in the soil leading from above to the bottoms of the drains. In digging drains in tough, compact clay, numerous small veins of water are cut, which show very clearly how readily the water will pass through such soil as soon as outlets are provided. The advantage of the deeper drains is thus explained, and it is readily seen that their influence extends further in proportion to their depth.

See Page 313—Basket Page 313.

"Walks and Talks" Correspondence.

So many persons write to the author of "Walks and Talks," asking questions upon the topics therein treated, that to answer them in the articles would either extend them unduly, or crowd out other matter. To obviate these difficulties, we give Mr. Harris a place in the Basket columns, where his answers to correspondents will hereafter be found under the above heading.—Ed.

Pigs and Acorns.—"C. P.," of N. Y. city, writes: "I bought a farm of 320 acres in Virginia. Shall move on to it this fall. I am going into the milk dairy business, and want to raise pigs. Being near a city where I find a ready sale for fresh milk at 30c. per gallon wholesale, there will be little chance for skimmed milk, or butter-milk. The buildings are surrounded by a grove of 7 acres of large oak, with a few hickory trees. Adjoining this grove is a wood-lot of 27 acres, mostly oaks. Both are fenced in. Many bushels of acorns cover the ground in the fall and winter. But I want to save all the manure from the pigs for my fields, and what I want you to tell me is how to utilize the acorns and save the manure."

There is no way of saving all the manure, except by gathering the acorns, and this, of course, will not pay. The best plan I can think of would be to keep the pigs out of the grove and wood-lot until the acorns had commenced to fall freely, and there was a full feed for the herd on the ground. Then turn in the pigs for an hour at a time twice a day, and keep them in the yard or pens at night. After they have got a good meal of acorns, the pigs may be brought back to the yard, or turned into a field of stubble or grass that you wish to enrich by their droppings. By doing this regularly at a given time, and by giving them a few ears of corn in the yard or field, the pigs could soon be taught to come when they are called. If you can get 30c. per gallon for milk at wholesale, sell every quart of it. At such figures you can afford to buy guano and artificial manures to raise grass, corn-fodder, and mangles, to feed your cows. Do not go too largely into the pig business, until you have had more experience.

Hurdles for Pigs.—"C. P.," further says: "Having no fences in the fields, I intend hurdling my pigs on clover lots." All of us, at some period of our lives, intend to do a great many things that we never accomplish. I think in C. P.'s case hurdling pigs on clover will be one of them.

Value of Acorns.—"What is the comparative value of acorns as food for pigs?" asks "C. P." According to the tables given by Prof. S. W. Johnson in "How Crops Grow," 100 lbs. of corn contain five times as much nitrogen, and about twice as much available carbonaceous matter, as 100 lbs. of acorns. I should think 100 lbs. of corn worth at least as much as 300 lbs. of fresh acorns. The manure from pigs feeding on acorns would be worth comparatively little.

Varieties of Wheat.—"R. P. E.," Cumberland Co., N. J., asks if I think the Diehl wheat will do well in that section. I can not tell. Like all good varieties of white wheat, it requires better soil and better treatment than the hardier and coarser varieties of red wheat, such as the Mediterranean. Mr. E. says they have not raised any white wheat for a considerable time, but can grow 25 to 30 bushels per acre of red wheat. Soil, a sandy loam, with a red clay subsoil. The Fultz wheat, he says, is being tried to some extent, and promises well.

All I can say is that the Diehl wheat is the best variety of white wheat I have yet tried. The millers do not like it as well—or at least they say they don't—as the Boughton or Sonles. The latter has almost entirely disappeared in this section, and the Boughton was never raised here to any considerable extent, as it proved too tender for our winters. Last year the Diehl was badly winter-killed, and many of our farmers gave it up and went back to the Mediterranean. This year the Diehl gives a good crop on good land. It should be sown on no other. If land will not produce a good crop of red wheat, it is useless to sow the white varieties. But if your land will produce a large crop of Mediterranean—so large that it is frequently lodged—try the Diehl. If it does well, you will get a larger yield of grain, and it will command a better price. It has remarkably stiff straw, and yields much more grain in proportion to straw than any variety I am acquainted with. Some of our farmers object to it on the ground that the straw of the Diehl is so hard and stiff, that it is not as valuable for fodder as the softer straw of the Mediterranean wheat.

Rape for Sheep.—"R. P. E." also writes: "My experiment with rape for winter pasture for sheep I consider eminently successful. I sowed early in August, after early potatoes, and by November had a heavy, dense growth, almost equal to a heavy crop of clover. Winter was open, with little snow, and the sheep fed on it all winter, and with great profit in the saving of hay and condition of sheep. I sold the sheep and lambs at the same time for \$12 the pair, in April and May. I sowed some rape seed in my corn field. It did not do near so

well as the other, but well enough to warrant me in recommending the plan to those who have no other and more suitable ground. My land is in fair condition, having raised 600 bushels of ears of corn on the five acres where the rape was sown."—Several of my correspondents, who have tried rape and mustard, have not found the advantage they expected. They are comparatively new crops in this country, and we need more extended trials, before recommending for general introduction. Mr. J. S. E., of Darlington, Pa., writes me, that he sowed rape two years ago, and that "the frosts of November froze it to the ground, and he got no use from the crop."—If he had turned the sheep on to it, I am inclined to think he would have found that it was less injured by the frost than he supposed from its appearance.

Swindling by Mail.

MORE BIG CREEK BAGLEYISM.

Our attention has been called to the article in the *Agriculturist* for July, entitled "Swindling by Mail," as being specially interesting to seedsmen in general, and soft-hearted ones in particular; we perused it, as it seemed to carry the conviction that we too had been victimized. Examining our books we find that in April last year, the Big Creek fraud had free seeds for the season. Upon further investigation we find that last February we were favored with four pages of poverty from the pen of a female Bagley, a Mrs. M. C. Bagley, of Big Creek. A letter containing an order for seeds amounting to \$10.95, and enclosing cash for same had been lost, so the story opens. We took the course usually taken by other seedsmen, offering to fill the order upon receipt of half the amount said to be lost. This offer was followed by many thanks, and an enquiry on departed finances, with the proposition that it would be more satisfactory to share the loss by sending half the seeds without further remittance. We failed to appreciate that logic, but filled the order out of charity, little suspecting that such a combination of "soft sawder" and rural simplicity, was but a veneer for rustic rascality. We are of opinion that Bagleyism blooms luxuriantly in Western, as well as Southern sections of the country, for there are other names familiar to us of persons who periodically suffer the loss of money which was never sent.

WASHBURN & Co., Boston, Mass.

Something about Patents and our Patent Department.

More than one correspondent has written to express his surprise that we should frequently find fault with the Patent Laws, and at the same time have a department for the securing of patents, and a brief explanation will satisfy a number of readers. In the first place we unmercifully pitch into those who, under pretence of having a patent upon some article long in use, attempt to swindle farmers and others out of their money. These are treated just as any other humbugs. Our patent laws are on the whole for the general good, and for the most part they are wisely administered. Still, the laws have defects, and patent examiners being human, make mistakes. We shall continue to expose the laws where they seem to us to be wrong—and in this we know we have the sympathy of the officers of the Department, and if the office grants patents in cases in which we think they should be refused, we shall express our opinion, now that we have a patent department connected with our office, just as freely as we did when we had none. Hundreds of our readers have written that they had made some invention, and asked us how they could get it patented, and wished to know if we could recommend them to an agent of whose fair dealing they could feel assured. Some months ago it came in our way to make an arrangement with a gentleman, who not only stands well with his clients, but is on a most excellent footing with the officers of the Department at Washington, to undertake the many cases which came to us. We were very glad to be able to say to our friends that their applications could be attended to in our own office, and that they could rely upon being faithfully served, not only as to the character of the advice given, but at the most moderate charges for such service. That this arrangement has met a want on the part of the public is testified by numerous letters; long-time friends of the *Agriculturist* express their great satisfaction at the establishment of a patent department, and show their sincerity by giving it their business. The following extract from a letter, dated Kent Co., Md., will serve as an example of numerous others: "Your department I think highly useful and important, to the inventor, not only in assisting him in procuring patents, but in guarding him against patenting things of no value."—Another writes from Fairfield, Iowa: "Thanking you for the fidelity and promptness with which you have transacted my business,

I remain, etc."—A reputation for "fidelity and promptness" is what we shall endeavor to maintain, and we hope that our readers will make this department known to such of their mechanical friends as do not take the paper. While we shall do our best to give all who apply to us the benefit of the laws as they now exist, this will not prevent us from suggesting improvements in these laws, and in this as in other matters our editorial department will treat these topics as it considers best for the public good.

The Potato-Bug in the West.

The following is from a correspondent in Illinois: Eastern farmers, who have had this season their first experience with the Colorado potato-bug, may be interested in a few notes on the actual warfare against the bugs, as it has been carried on among those who are now veterans in the fight. In many localities the bugs gain a foothold the first year of their appearance, because there are comparatively few of them. Insignificant numbers do not provoke general offensive movements, and the bugs, increasing during the summer, begin work the second year in overwhelming numbers. When the bugs first appeared in Ohio, people held many theories in regard to their poisonous qualities, and in regard to the best methods to destroy them. There was a mystery about these potato enemies, and people disliked to come down to close quarters. The papers described how certain individuals had been poisoned by bite or sting, and timid people found in this an excuse for letting the bugs alone. Some one announced through the papers that his ducks ate the bugs, and another man that his turkeys ate them. Every one who had ducks and turkeys waited for them to do their duty as bug-destroyers, which they rarely did. Many tried to frighten or stun the bugs by firing shot-guns in such a way as to rattle the rows. This plan was popular with the boys. It was discovered that the soldier-bug, lady-bug, etc., warred upon the potato-bug, and forthwith boys and men suspended labor, as if to give the gallant soldier-bugs a fair chance. Paris green, mixed with flour and plaster, was used. But then this was poisonous, and the dust from it entered the nose and eyes. This objection was met by mixing Paris green with water—a large table-spoonful to ten quarts of water—and this sprinkled freely over the vines. But many who mixed the Paris green and water, neglected the important feature of stirring, and failed to accomplish what they expected. And then the application of this killed soldier-bugs and lady-bugs, as well as potato-bugs. This was an objection. Many men, who understood what the soldier-bug was doing against the common enemy, refused to use Paris green. These men picked the potato-bugs off by hand, and burned them, or brushed them off, and plowed them under, or brushed them off at noon-day, and saw them roast on the hot, sandy soil. Others invented wooden tongs, with a movement like the old-fashioned sheep-shears, and killed the bugs with these. In many localities the tongs were popular; in other localities people laughed at them. In one neighborhood it was firmly believed that mustard, growing among potatoes, was a defence against the bug, while in a neighboring township this was pronounced a humbug. People held tenaciously to certain methods. A, B, and C would work hard, and clear their grounds of the pest. D would let them go, and from his grounds A, B, and C received new instalments. This would never do. The farmers in the township organized, and all cleared their fields of the potato-bugs, and then they had potatoes. In this way only was effective work accomplished. Farmers must work together, and work in earnest. Where there were farmers' clubs, this kind of work was easily inaugurated, and carried to a successful issue.

The result of experience is: When there are comparatively few bugs, pick them off as soon as they appear, and destroy them. If the eggs have been deposited, destroy these. When the bugs are numerous, use Paris green with water. This is safer, and more economical, than when used dry with flour or plaster. When the bugs appear the first season, do not flatter yourself that you are to be more fortunate than your Western neighbors, because they are few. The advance guard once in position, you are at a disadvantage. Destroy the advance guard, and he ready the next season to continue the work of destruction.

Bee Notes for August.

BY M. QUINBY.

Bees in Kentucky.—O. Brumfield, Boyle Co., Ky., writes: "How can I best shade my bees in the absence of shade-trees? I am living at a newly built place, and have not a tree, except small ones just planted. How would a long arbor covered with grape or hop vines do? I have about 50 stands. How close should they be

placed? When bees are in a cool place, and will persist in hanging outside the hive instead of in boxes, what had better be done with them? Last year I had about eighty hives; lost thirty in winter. I suppose five-sixths of the bees in this section (Central Ky.) died. Mine died mostly in spring."—Bees protected from cold north wind and exposed to the sun during the early part of the season, are better off than if shaded. Many stocks were lost, even in the Southern States, last April, apparently on account of chilly winds and cool weather. If it could be arranged that they receive the sun's rays until some time in June, and then be shaded, it would be nearly right. Probably hop vines would do it best. A movable roof of some sort should protect each hive from the rain; if its dimensions are ample, and it is raised just a little above the hive, it will do very well in the absence of a leafy shade. It can be removed in fair days during spring. The distance apart for stands should be six feet, and as much more as space will allow, if it is fifty feet. If there is room enough in the hive, or boxes, bees will not hang outside the shaded hive idle, except perhaps occasionally an hour or two towards night.

Kinds of Honey.—In New York State, different localities, only a few miles apart, produce distinct qualities of honey. In different States and latitudes the quality of honey varies. Nearly all sections yield some from fruit blossoms and dandelions. It is not often that we obtain much surplus honey until clover yields it, and this is considered superior to most kinds. When bees can reach bass-wood, larger quantities are obtained in less time than from clover. The distance they will go for it, greatly depends on the serenity of the weather. The appearance of bass-wood honey is equal, if not superior to that from clover. It has an aroma greatly prized by many. It yields from July 1st to 20th usually in this locality. Buckwheat, in some sections, supplies the greatest yield. It is dark colored, and the flavor not so pleasant to most palates. When it is desired to keep the white honey separate, all the surplus should be removed now. In sections where buckwheat is grown plentifully, bees will often obtain enough, and often much more than is sufficient for their winter stores. In some places, as the prairies of the Western States, the asters, golden rods, and other late flowers furnish honey of medium quality; the bees will winter on this. If honey that is stored in boxes, or even that in the body of the hive, is taken with the extractor the beginning of this month, the bees will usually accumulate enough for winter. If they fail to do it,—which may be known by weighing—feed syrup of sugar, which is just as good as honey, until their stores are ample.

Cleaning Stubble Land.

The farmer who has a field which has grown wheat, or barley, or oats this year, and is not seeded down, and which is not to be sown with any other crop until next spring, has an opportunity of cleaning his land, that should on no account be neglected. The English farmers seldom seed down their land with wheat. After the wheat is harvested, they harrow the land, or tear it to pieces with a three or four-horse cultivator or "grubber." This pulls out the roots of quack-grass, and starts the seeds of other weeds. The field is afterward plowed, when, of course, all the young weed-plants are destroyed. The grubber is kept at work as often as necessary to clean and mellow the land. The next spring this land is sown to turnips or mangels, or, on heavy land, to beans or barley. It is said that this autumn cleaning of stubble land by the free use of the grubber, especially when operated by the all-powerful steam engine, is one of the greatest agricultural improvements of the age.

What is true of English farming, might be still more emphatically true of American agriculture. Our autumns are longer, and drier, and hotter than they are in England, and we have a better opportunity to clean our land, while there is certainly a greater necessity. Our fields are fearfully foul with all kinds of weeds, and in many instances they are annually gaining a stronger foothold. We must fight, if we would win. It will not do to go on in the old way. With our drying winds and hot sun we ought to have the cleanest farms in the world

—and sooner or later such will be the case. We must kill weeds by wholesale. It will not do to depend on the hoe and the fingers. Nature is never at rest. It will not do to let land lie idle. When it is not occupied with growing crops, we should be occupied in stirring the soil and killing weeds. It is the great secret of success in farming.

The Osprey, or Fish-Hawk.

Upon the first page is given an engraving of the American Fish-hawk, or Osprey (*Pandion Carolinensis*), and its nest. This bird is found in all the temperate parts of the United States, and is well known to those who live near the sea, or large bodies of water, for its skill and industry in fishing. Its length is about 25 inches, its wing 21 inches; the head and underparts are white; the top of the head, upper parts of body, wings, and tail, of a deep brown, and there is also a stripe of the same color through the eye. This bird arrives in the Northern States late in April, or early in May, and builds its nests in the vicinity of the sea, a lake, or large river, a number of pairs often locating within a short distance of one another. The nest is usually in the top of a large tree, and frequently a decayed one is selected; it is about four feet across, usually as high as broad, is composed of sticks and coarse grasses, and lined with sea-weeds and the finer grasses; the same nest, with annual repairs, lasts the same couple for several years. Three eggs are laid, and when the young are hatched, the parent birds are assiduous in supplying them with fish. The Osprey sails in mid-air until it spies a fish, and then, by a sudden dart downward, seizes it in its talons, often in its plunge going quite beneath the water, and as it rises, seldom fails to bring its prey, which it carries to its nest, provided it is not robbed by some Bald Eagle, which has been watching the movements of the more industrious bird. For a bird of prey, the Osprey is remarkably peaceable, living not only on good terms with its own species, but with other birds. Indeed, it allows various smaller birds to build among the outer sticks of its own nest, a peculiarity which the artist has recognized in the engraving.

How to Kill Wild Mustard.

A correspondent of the *American Agriculturist* has a farm well stocked with Wild Mustard, or Charlock, and he wants to know how to get rid of it. His rotation is corn on sod, barley, followed by winter wheat, and seeded with timothy in the fall, and clover in the spring. His barley crop is badly infested with wild mustard. He has pulled it out of the barley, but it is a good deal of work, and he thinks his labor is thrown away, as there are more "yellow-heads" now than formerly.

We would suggest the following plan. Plant corn as now. Cultivate thoroughly, and as late in the season as possible—say up to the first week in August. As soon as the corn is cut, and while the stooks are still in the field, cultivate between the stooks with a two or three-horse cultivator. After the corn is husked, and the stalks drawn in, cultivate the field again, and afterward plow it, and leave it for the winter. The next spring cultivate it as soon as the land is in good condition to work, and harrow, and roll. In a week or ten days, plow, cultivate, harrow, and roll, till the land

is as fine and mellow as a garden. Then instead of sowing barley, plant it again to corn, or potatoes, or root crops, or beans. The latter are perhaps best, as they need not be sown till the middle of June, and wheat may be sown after them in the fall, and thus you can seed down the land, at the same time as you would, had you sown barley.

The thorough cultivation, and the repeated plowings, will make the land so fine and mellow, that the mustard seed will start freely in the spring. If you plant corn, or potatoes, or roots, the mustard will be killed by the cultivator or hoc. If you plant beans, there will be time to give an extra plowing in June, and this will kill all the mustard plants, and if more plants spring up afterwards, they will be killed when you are cultivating and hocking the beans.

If you plant early potatoes instead of barley, they may be dug in time to allow of sowing winter wheat. But if you plant corn, or sow root crops, and wish to follow them with barley the next spring, we would drill in the barley early in the spring, put in two or two and a half bushels of seed per acre, and put it in deep, and roll immediately after the drill. Then when the barley is fairly out of the ground, and when the young mustard plants are just starting, go over the field with a fine-tooth harrow; lap enough to completely scratch over all the surface of the soil, and thus tear up and kill the young and delicate mustard seedlings. Do this work thoroughly at once, and then follow immediately with a roller. This will kill thousands of weeds, and will not injure the barley. If you wish to seed down the land, sow the clover and grass seed, after the harrowing and before the rolling. There is no better crop to seed with than barley.

Ogden Farm Papers.—No. 54.

What a country it is; and what a people! I have a letter from a farmer in this State, asking my advice concerning the recommendation of an "Agricultural Chemist," who comes to him with the endorsement of certain wealthy men of Providence. This chemist has found a short cut to agricultural wealth. "He can analyze the soil by putting it in his mouth, so that he can tell exactly what that soil wants to make it perfectly productive, and to continue to improve without manure, except some chemical preparation of ammonia or alkali, which he will give directions for making from soda-ash and other things, the application of which, at an expense of one, two, or three dollars an acre, will set in motion the latent powers of the soil, and produce fine crops, year after year, without other manure. He goes through each field, and tells what to apply to each one, and how to make it. His charge, he says, is quite moderate: says he was brought up a soap manufacturer, etc., etc. Now, we are all anxious to make some money at farming, and setting aside the heavy expense of manure, we can do it. My farm has been heavily manured for years with fish, and he says I am walking over thousands of dollars every day that are latent in my soil, and that he can set in motion at such a trifling expense, and so little trouble. Is he a humbug? The loss of one crop through him would be to me a serious matter; therefore I ask your advice."

Of course he is a humbug. He has gone from the substantial industry of making soap to the more promising one of making "soft-soap," with which he will smear light-headed farmers,

until he makes them believe that they can get something out of nothing, and I have no doubt, as the fools are said to be not all dead yet, that he will make a good thing of it. The temptation to travel on a royal road, and to win success by a short cut, is strong with us all, and a glib-tongued traveling-agent generally finds us good plucking. Certainly there is much latent fertility in the soil, and there is no doubt that it may be more rationally developed by the use of ammonia and other stimulants, but unless this is done with judgement, and unless the product is so used, as to return manure to the soil, all excessive production will result in greater ultimate impoverishment. It will be the wisest plan to develop the "latent fertility" by growing good crops of clover, and by other judicious processes of good farming, and to stick closely to an intelligent application of "the good old way." It is pretty well determined, that the best laboratory analysis of the soil is of very little value as a guide in manuring, and we should hesitate to advise our readers to put more confidence in an analysis made by "putting the soil in the mouth!"

A correspondent in Wisconsin asks: "Would it do to cross a Jersey bull on a grade Ayrshire heifer? My Jersey bull is getting very fine calves from native cows. The first one of these calves that has bred, is a fine milker, with very rich milk. She calved at 17½ months, and is now giving about 12 quarts (calf three weeks old). The bull is fawn and white in color, darker about the head, fine horns, and the yellowest skin I ever saw. He is 3½ years old, and weighs about 1000 lbs.; is very quiet and orderly. Out of about 100 cows that he has had, there have been but 15 or 20 bulls. His calves from deep red or brindled cows, are of a light liver color, with the white ring around the muzzle, and the deer-like limbs of the Jersey. By the way, I notice that the milk of my native cows, which have been served by this bull two or three times, is richer in butter than ever before—so that some of the qualities of the sire must impregnate the dam."—There is no reason why a Jersey bull should not be bred to a grade Ayrshire. The better the cow, the better the calf, and there is no better cow to be found for ordinary family use, than a cross between the Jersey and the Ayrshire (pure), therefore, the Ayrshire blood in the cow in question can be only an advantage. How much the bull has to do with determining the sex of the calf, is not known. It is perhaps a question of his relative vigor, as compared with that of the cow, some breeders claiming that if the bull is the more vigorous, the calf will be a female, and vice versa. The fact that the bull is a Jersey, can have nothing to do with the question; the fact that he is a choice animal, and is kept in unusually good condition, may have very much to do with it. The increasing richness of the milk of the native cows, which have been served by this bull, would be sufficiently accounted for by the fact of their increasing age. It is hardly necessary to go so far as to ascribe it to the effect of their having been served by a bull of a richer milk, which would be very far indeed.

Dr. McClure, veterinary surgeon, of Philadelphia, writes to say, that the tonic-recipe, communicated to me by Mr. Sam. J. Sharpless, and given in the May number of this series, was given by him to Mr. S., and that it is published in his work on the "Stable, Field,

and Farm-Yard." He claims that this tonic has been found quite as effective in staying abortion in the afflicted dairy-regions in New York State, as in the instances I cite. I cheerfully give him due credit.

I am always glad to have another herd than my own to use as an illustration of the value of Jersey blood in the butter dairies, and I have before me a statement of one year's product of the little herd of Mr. T. J. Hand, of Sing Sing, N. Y., who is now president of the American Jersey Cattle Club. The herd consisted of eight cows, viz.: one 7-yr. old, two 5-yr. olds, three 3-yr. olds, and two 2-yr. olds. There were two Ayrshires in the herd, one for four months, and one for three months. The time covered by experiment was one year. Four of the elder Jerseys were in the herd the whole year; one 5-year old only for the last three months of her milking period; one 3-year old for the last eight months; one 2-year old for the first four-and-a-half months; and another 2-year old for the first five months. Three of the older cows calved twice within the year. The milk of one cow was furnished to a neighbor for June, July, and August. Deducting these three months, the herd foots up 7 $\frac{1}{2}$ months, including the dry period of three cows. Deducting (as is usual) one-half of the time of the two 2-year olds, or 4 $\frac{1}{2}$ months, we have 68 months in all, which is equal to *five and two-thirds* cows for one year. The calves were fed with fresh milk until one month old. The milk and cream used in the family were estimated to equal a product of more than 350 lbs. of butter, but as this is only an estimate, though I do not doubt its correctness, I propose to reduce it to one-half the amount, and call it 175 lbs.

There were actually churned 1,617 lbs. of butter. Adding the 175 lbs. above, we have 1,792, which, divided by 5 $\frac{1}{2}$, gives over 316 lbs. per cow per year, besides the feeding of the calves. 1,404 lbs. of butter were sold for \$965. If what was consumed by the family had been sold for the same price (69c. average), the whole product would have brought \$1,206, or \$21. per cow. Sold at a low average price for butter shipped to the general market in New York, say 30c. net, the product would have been \$537.00, or \$95 per cow, which is fully \$45 per cow more than the average of good dairies in New York State, where "native" cows are kept. This \$45 represents the value which would directly accrue to a dairy farmer of the better class, if he used Jersey cows instead of native cows. Indirectly he would have the further advantage of a better quality of product, which would add at least 5c. per lb. to its value, and \$15 per cow to the net income.

Practically, any farmer, in order to realize the same result, would have to follow Mr. Hand's better method of feeding, or he would fall short of his large result, but the result is due quite as much to the breed as to the feed, and the whole example (except in the matter of price) is a perfectly easy one for any farmer to follow. Now, who can supply himself with Jersey cows. Of course the large majority of farmers can not do this, but \$100 will buy a first-rate Jersey bull calf, of the best butter strains, and one such in a dairy neighborhood will, in a few generations, give such an infusion of improved blood, as will add thousands of dollars to the permanent wealth of the community.

One of our experiences, which have been before referred to in these papers, it may be worth while to report upon again.—That is the

manner in which we are supplied with water. About 1,000 feet from the milk-house, and 800 feet from the barn, there is a well in which the water usually stands at a level 48 feet below the top of the tank in the barn, and about 35 feet below the point at which the pipe enters the milk-house. The communication for the whole distance is by means of a wooden pipe (4 inches square, with a 1 $\frac{1}{2}$ inch bore). Under the barn a branch rises to the tank, and by turning a stop-cock, the water is stopped from its flow to the dairy, rising to the tank. When this is filled, the cock is opened, and the water passes on to the dairy, where it always flows when the pump is at work, which is whenever the wind blows (fully three-quarters of the time), keeping the water always fresh and cool in the vat in which the milk-cans are immersed. Occasionally, in very dry weather, the well furnishes a scant supply, and we then have to use ice, but practically we are rarely without an abundant supply of water.

For some years we found the wooden pipe troublesome, as it will occasionally spring a leak. When this happened, it cost nearly ten dollars to insert a section of lead and iron pipe. We finally hit upon a plan, which removed this objection: As the leak in a wooden pipe is always a split, it is only necessary to squeeze the pipe firmly together, and this is cheaply and quickly done with an iron clamp put around the pipe and screwed tight. This removes the only practical objection to this tubing, and enables us to use, at a cheap rate, a conduit of large bore. This is a great advantage, for the resistance by friction is considerable in a small pipe. In a larger one, as a given amount of water is delivered by a slower current, the friction is less, in proportion to the squares of the diameters, being four times less in a two-inch pipe than in a one-inch pipe. Consequently, the saving of power in a large pipe is very considerable.

The motive power of the pump is a self-regulating windmill, and in the use of these we have had a varied experience. The first mill put up (six years ago) was an old-style Empire Mill. This worked very well for two years, then it became worn and shaky in many of its parts, and had frequently to be repaired during the following year, and was finally wrecked beyond the possibility of repair. This was followed by a new and improved style of the same make, but, from want of strength in some of its parts, this was partly wrecked in less than a year, and had to be repaired at considerable cost. Finally, in March last, it met with another accident, and had to be abandoned. Then I cast about for a mill of more simple construction, and concluded that the most perfect machine of the sort now offered is the United States Mill. As the former mills had obviously had more power than was worked, being 12 feet in diameter, I decided on a U. S. Mill 8 feet in diameter. This has now been running sufficiently long to prove its capacity to give us all the water we need, and more, and from my previous experience with self-regulating mills, and with machinery generally, I am satisfied that the chance for permanent usefulness is very good. This new mill cost only \$100 (the previous ones cost \$175 each), and we are fairly started on our seventh year, with an outlay of say \$500 for power. This is considerable, of course, but the benefit derived has been very great. Aside from having ample water for a large stock, winter and summer, we have fresh, cool water for the milk vat, without which we should be unable to

make the uniformly good quality of butter, on which much of our income depends.

We are having a capital season for grass, and thus far the frequent rains have been kind enough to come at a time when they did more good to what was standing, than injury to what was cut.

In detailing the operations of the farm, it seems proper to follow the commendable example of many other breeders of thoroughbred stock, and give an account of our sales of Jerseys. During the first half of the current year we have sold as follows—partly from the home herd, and partly from the branch in Southern Illinois (where, if we get only one-third of our Eastern price for butter, we pay less than one-third the Eastern price for hay and pasture). Bull calves sold (less than 1 year old):

M. D. Ralph, Rodman, N. Y., Belnor, No. 1,018.
Edgar Doolittle, Onaquaga, N. Y., Callidan, No. 1,039.
Andrew Thompson, Brushland, N. Y., Rhode Island, No. 1,333.
Andrew Thompson, Brushland, N. Y., Jesse Burnett, No. 1,370.
Chas. J. Reed, Fairfield, Iowa, Sapper, No. 1,026.
Jos. Y. Heckler, Harleysville, Pa., Julius, No. 1,383.

Yearling bulls:

Dr. J. C. Gunnell, Alexandria, Va., Merry Andrew, No. 719.

J. M. Brown, Portland, Me., Tug, No. 1,126.

Heifer calves:

Dr. N. R. Boutelle, Waterville, Me., Fantibel, No. 2,679.
Campbell Brown, Spring Hill, Tenn., Roxabel, No. 2,743.
" " " " " Renebel, No. 2,772.
" " " " " Donora, No. 2,680.
" " " " " Beleva, No. 2,677.
Chas. J. Reed, Fairfield, Iowa, Kyridonna, No. 2,681.
" " " " " Beloona, No. 2,676.
Geo. W. Palmer, Saltville, Va., Belvira, No. 2,771.

Yearling and 2-year olds:

Campbell Brown, Spring Hill, Tenn., Duchie, No. 2,500.
" " " " " Anna Roxbury, No. 1,803.
G. J. Shaw, Detroit, Me., Madagascar Queen, No. 1,806.
J. M. Cobb, Beloit, Wisconsin, Moonah, No. 2,688.

(The numbers refer to the entries in the Herd Register of the Am. Jersey Cattle Club.)

The 20 animals sold for \$2,740, being an average of \$137. 8 males sold for an average of \$83.12. and 12 females for an average of \$172.92.

Just as I am finishing this I have a second letter from my correspondent, whom I had advised to spend no money on the testing "chemist." He says: "A neighbor of mine paid him \$35 to go over his farm. If he had offered to go through any kind of regular analysis, I should have invested in him too, but the mouth analysis made me hesitate. He says he came down this way for sea air, that his system is full of 'pizen' from the dirt in his mouth so much. He said he could not only tell by the taste, but he could see the different constituents of the soil run different ways, separated in the saliva when he spit it out. His certificates were genuine, and from some of the best people in Providence. He has spent two days with a wealthy neighbor, and bagged \$50 or \$75 from him. What do you think will come next? A man was along to get subscribers for a book, to tell farmers how to make any quantity of manure at almost no cost at all—price \$10. He got about 50 subscribers in this town. When the book came, it advised saving the sweepings of the house, the soot from the chimneys, and all the dead things to be found round about."

The last fact stated, makes it seem worth while to recount this nonsense.

Animals for Exhibition and for Use.

It must be confessed that there is a wide gap between the breeders of our most highly valued stock, and the farmers, for whose interest, it is the fashion to say, that these costly animals are bred and exhibited. If a Shorthorn bull

or cow has any intrinsic value at all, it is only so far as it promises to affect the value of our general farm stock in the near or distant future, and in so far as at some time to come the milk pail may be filled, or the butcher's stall may be weighed down with its produce. Certainly no one supposes that a show-animal is valued for its product of milk, or the weight of beef in its carcass.

The ordinary farmer, viewing the mammoth proportions of a prize animal at one of our fairs, may possibly have some faint dream of a time when he may lead his cow to be served by such a bull at some cost within his slender means, but generally he views the animal in a state of bewilderment at the evident impossibility of that time ever coming.

Consequently there is a want of interest upon the part of the majority of visitors at State fairs, where our best stock is exhibited, while at less noted exhibitions, such as local or county fairs, this lack of interest is not so conspicuous. It has become a serious question, if the present eager disposition to run up the prices of Shorthorn stock to unprecedented figures, even at the risk of giving rise to suspicions of bolstering up prices by fictitious purchases, is not injurious to the general agricultural interest, and greatly retarding the day when we might hope to see the final fruition of the long continued labors of breeders.

Each sale and dispersion of herds only seems to remove farther than ever from the farmer of moderate means his hope of some benefit from this stock, and the possession of a "Duke" or a "Duchess" for himself. It has also become a question, if the high feeding resorted to, to get show animals into condition, is not injuring, if not destroying, the usefulness of these favored families of stock. These remarks are intended to be general, but they apply with the greatest force to a few families of Shorthorns, which are never seen in public, but in

that state of uselessness, known as show-condition. We desire to propound the question at this seasonable period, if it would not greatly extend the usefulness of the Shorthorn, as well as every other high-bred class of stock, to exhibit at least occasionally some choice breeding animals in working condition? If agricul-

St. Ruth was awarded the first prize as a breeding animal in 1873, as a two-year-old, and certainly gave promise of success the present year. But the bull King Richard II. took the honors from him this year, among twenty-nine competitors, one of which was the bull Breakspear, an animal of American birth, which was found

worthy to be taken across the Atlantic. At first sight the judgment might be considered at fault, but when these bulls are considered as animals designed, not for show, but for service as breeders, the judgment is a proper one. A comparison of the merits of the two animals decides this point. Although both portraits are somewhat distorted in the process of photographing, one can sufficiently appreciate the finer head and fore-quarters of King Richard II., and his capacity for laying on flesh, to admit

his superiority, notwithstanding that he is thin and out of condition, and is light in the hind-quarters. The better condition of the St. Ruth bull would give him a great advantage, but not enough to overpower the greater possibilities of his rival. It is just the education to be given by the exhibition of such animals as these, and the opportunity for study furnished thereby, that are needed to remove the prejudice against what is known as fancy stock, on the part of a majority of our farmers, who visit the state and county agricultural fairs.

It is a fact that occasions mournful comment upon the part of Shorthorn breeders and live stock journals, that there is no demand for bulls, wherewith to improve the common stock of the country, and that only "fancy" bulls are in demand, and that by fancy breeders; also that "good, useful bulls are now selling at lower prices, comparatively, than they were twenty-five or thirty years ago." How much of this is due to the present system of exhibiting cattle at fairs, and to the absurd and impossible engravings, called portraits of

IRISH BULL "KING RICHARD II."

tural associations are what they ought to be—educational institutions for the benefit of the agricultural class—it would seem proper that such lessons should be given as could be understood and appreciated, and from which something should be learned by the largest class of visitors, the farmers. How little is learned by the great mass of farmers from the show-ring or stalls, filled with high-fed show-animals, we know very well from mixing with the crowd upon many such occasions.

We think they manage these matters better elsewhere, and notably so in Ireland, if we may

IRISH BULL "ST. RUTH."

judge from the report of the exhibition of breeding stock of Shorthorns, recently held at Dublin. As an example of how they do these things there, we have carefully engraved the two accompanying portraits of prize animals at the Dublin shows of 1873 and 1874, which appeared recently in the Agricultural Gazette. The bull

Shorthorn stock, so widely published by agricultural journals, for the wonderment of their readers, is a question which is inviting the attention of breeders. It is now fully time that the long talked of improvement of our common stock should begin, and this can not be done with \$14,000 bulls, nor \$40,000 cows.

Walks and Talks on the Farm.—No. 128.

Last fall, a week or ten days after the wheat was up, I went over the field with a Thomas' smoothing harrow. I did this for the purpose of killing the weeds, more especially red-root. This weed is a great pest. The seed germinates in September and October. The young plants make their appearance in the wheat in October and November, looking as innocent and harmless as red clover. During the winter they send out their tap-roots, and take firm hold of the soil. After this there is no way of killing them, except by hoeing and pulling. In the spring, especially where the wheat is thin on the ground, the red-root plants grow rapidly, and throw out numerous branches, each of which produce a bunch of flowers, and in a few days, or say by the middle of June, the seed is formed, and before clover is fit to cut for hay, the seed is mature enough to grow. It has a hard husk, and contains a good deal of oil. It will lie in the soil for years without rotting, and will start into growth in the autumn, whenever the condition of the soil is favorable. The rotation of crops, adopted in this section, is admirably adapted for the spread of red-root. For instance, we sow clover with our wheat. The next year we mow the clover for hay, and afterward for seed. The next year the field is either mown again, or pastured. The next spring it is plowed up for corn, cultivated until July, and the next spring it is plowed, and sown to barley, and after the barley is harvested, the land is plowed, harrowed, cultivated, and plowed again, and made very fine and mellow, and is then sown to wheat in September, and is sowed down with clover and timothy in the spring.

Now let us see what the result will be, so far as the spread of red-root is concerned. There is red-root in the wheat. It goes to seed, and a considerable proportion of the seed falls on the ground. In September such of the red-root seeds as find a good seed-bed, start up in the clover. The plants grow during the fall and winter months, and especially if the crop is light, the red-root plants flower and produce seed, and when the clover is made into hay, the red-root, with its seeds, is carefully stowed away in the barn or stack, and during the winter is fed out to stock, and the seeds find their way to the manure. This manure is drawn out, spread on the land, and plowed under, seeds and all, for corn. The seeds lie dormant under the furrow. The next spring the corn stubble is plowed for barley, and the red-root seeds are mixed with the soil. After the barley is off, the land is plowed once or twice, and well harrowed, and cultivated, and rolled, and then sown to wheat. And then up comes your red-root. It goes to seed in the wheat, and afterward in the clover, and in a few years our wheat farms are overrun with this pest.

Now, if we could discover some cheap method of killing the young red-root plants in the wheat, it would be a great boon. I had found, by repeated trials, that harrowing in the spring will not kill the red-root plants. They have then got too firm a hold on the soil, and so I thought I would try it in the fall. Three years ago I harrowed part of a field in November. The wheat, I thought, was better when it was harrowed, but it did not kill the red-root. I did not harrow early enough. Last fall I commenced to harrow the wheat as soon as it was fairly up, going the first time lengthwise of the drills. It did not pull up the wheat,

but where the soil was very mellow, it covered some of the plants. I found, that by going over the field with a roller before harrowing, this difficulty was to a considerable extent overcome. And if any are disposed to try harrowing their wheat this fall, I would strongly advise them to roll it first. I have always been opposed to rolling wheat in the fall. But in this case it certainly was a benefit.

I found that the first harrowing killed thousands of young red-root plants and other weeds, and I was willing to kill a little wheat for the sake of killing a good deal of red-root. But I soon found a new crop of red-root springing up from more seed. And so we harrowed the wheat again, going crosswise of the drills, in hopes that the harrow would uncover the wheat plants buried by the previous harrowing. It had this effect to some extent, and it also killed the young red-root plants. After this, say the last of October, we harrowed it again for the last time.

We certainly killed millions of red-root plants on this field of 13 acres, but, I am sorry to say, there were thousands left.

"Well," says the Deacon, "you ought not to grumble. You would have had a tough job hand-picking on that field, if you had not harrowed it. But we all think that you hurt your wheat by harrowing it."

"Of course you do," I replied, "you said the same thing when I first harrowed my wheat in the spring. Now, all the young farmers, and some of the old fogies, are in favor of spring-harrowing. I shall harrow my wheat again this fall, taking care, however, to roll it thoroughly, to press down the little ridges left by the drill-tubes, and leave a smooth surface for the harrow. I think, too, I shall sow my wheat earlier. I have usually sown about the 15th of September. If the land is in good condition, this is probably the best time. But on poorer land a week or ten days earlier may lessen the chances of a failure."

Several gentlemen have written me in regard to the sheep and lambs, which the Deacon and I weighed, asking me to weigh them again and report. If we were not so busy hoeing mangels, I would do so. The Cotswold rams are out in the lot back of the Deacon's, and we have not had them up to the barn for some time. But at the next opportunity I shall weigh them. As I said before, I do not go in for heavy weights. My rams are in rather a poor pasture, and do not have any grain. I believe in feeding them all they can eat and digest, when young, but after they are ten or twelve months old, they should be fed only enough to keep them in vigorous health. This stuffing thorough-bred rams with grain, and loading them with fat, for the purpose of showing at the fairs, is almost certain to result in weak, puny lambs. I think it is time that we stopped importing sheep and swine. At any rate, we ought to know enough by this time, not to import the "prize animals."

But I was going to say, that this morning (June 17) we had the flock of ewes and lambs at the barn, and put a few of the lambs on the scales. The following are the weights of some pure-bred Cotswolds. Ram lamb, born March 16, weight at birth, 14 lbs., April 18, 33 lbs., May 22, 60 lbs., June 17, 76 lbs. This is not bad for a three months old lamb. He would dress, according to my rule, 43 lbs. This is the largest, but not the best pure-bred lamb in the flock. A pair of twins, a ewe and a ram, born March 23, weighed at birth, ewe 9½, ram 10 lbs.

April 24, ewe 20, ram 24 lbs. June 17, ewe 45 lbs., ram 52 lbs. It will be seen that the single lamb gained 19 lbs. the first month, and the pair of twins 24½ lbs. During the three months the single lamb has gained 62 lbs., and the pair of twins, together, have gained 77½ lbs. A ram lamb, born April 18, weighed 12 lbs. at birth, and 53 lbs. June 17. Another, born April 30, weighed 14 lbs. at birth, and June 17, 60 lbs. This is a gain of 46 lbs. in 48 days.

The following are the weights of some *grade* Cotswold lambs. One ewe lamb, born March 14, weighed at birth 10½ lbs., April 14, 29 lbs., June 17, 71 lbs. Mr. Lawes' "fat lamb," killed for analysis, August 16, when about six months old, weighed alive 84½ lbs., and dressed 50½ lbs. This was a well-bred Hampshire Down lamb. I think my little *grade* ewe lamb, with only two crosses of Cotswold blood in her, and descended from a common Merino ewe, that cost me \$2.40, need not be ashamed of this comparison. If I do not forget it, I will kill one of these *grade* lambs, when of the same age as Mr. Lawes' lamb, and weigh all the different parts of the animal, as he did. I think I can beat him. I never liked Cotswold mutton, and I am not going to change my opinion on this point, simply because I happen to keep a flock of pure-bred Cotswolds. They are too fat for my eating. I killed one last winter with four or five inches of pure fat on the ribs. It is capital food to steam up, with a barrel of sliced mangels and corn-meal, for pigs that you want to push ahead rapidly. If a butcher wants a fat sheep that will dress 200 lbs, to hang up in his shop for show, let him have it. Don't kill it for your own use. When you want good mutton, get a well-bred *grade* Cotswold-Merino, and call it South Down.

In saying Cotswold-Merino, I do not wish to be understood as implying that Leicester-Merino, or Shropshire Down-Merino, or Lincoln-Merino, or South Down-Merino is not just as good. All I am contending for is that, with thirty million of sheep in the United States, and with flocks of pure-bred Cotswolds, Leicesters, Lincolns, Oxford, Hampshire, Shropshire, and Sussex Downs, where good rams can be had at low figures, there is no reason, why we should not have all the good lamb, and mutton, and wool, that the country needs—and that without importing another sheep from England. But all this time Fred is waiting to weigh another *grade* ewe lamb, born March 16, weight at birth, 12 lbs., April 14, 30½ lbs., June 17, 70 lbs. A ram lamb, born March 25, weighed at birth 11½ lbs., April 24, 31 lbs, and June 17, 66 lbs. A pair of twin-lambs, born March 22, weighed at birth, ram, 10½, April 18, 27 lbs., June 17, 65 lbs.; ewe lamb, 9½ lbs. at birth, April 18, 24 lbs., June 17, 51 lbs. They are not three months old, and the pair already weigh more than their mother.

After weighing the lambs, starting the men to cultivate and hoe mangels, corn, and potatoes, and Walking and Talking a little on the Farm, as above, I went to Rochester in the afternoon, got on the express-train at 5.25 P. M., and the next morning at 7 o'clock I was in New York. At 8.15 A.M. the steamer "Virginia Seymour," which had been engaged for the trip, left the pier at 33rd-st., East River, with a company of ladies and gentlemen on a visit to Beacon Stock Farm, on Long Island. Mr. Delamater, the owner of the farm, was on board, and gave us all a hearty welcome. We steamed up the river some forty or fifty miles, and reached the farm about noon. All this

time I was congratulating myself that I had left so quietly, that the men, who were hoeing mangels in the field at home, would be expecting to see my old hat coming round the corner, while I was between four and five hundred miles away, inhaling the invigorating air of the Atlantic ocean, and having a good time generally. Great is the age of steam! The readers of the *American Agriculturist* have frequently heard of Mr. Crozier's farming. Mr. Delamater owns the farm, and his long purse has furnished the required capital without limit. The land is naturally poor, but it proves amenable to good cultivation and manure. Mr. Delamater was fortunate in securing such an energetic and skillful Scotch farmer, as William Crozier, to undertake the labor of renovating this charmingly situated farm. He told him to do just what he pleased, to "go ahead and not bother me"—except with the bills! Mr. Crozier has gone ahead. Delamater and Crozier are such a team as we seldom see in this country. They pull well together, and are as strong as their favorite Clydesdales. I wish there were more such men. But I doubt if this is the style of farming that will ever become general in this country. Most of us are poor, and have to dig our money out of the land before we can spend it. We could farm much better if we had more capital—or, at any rate, we think we could. Perhaps if the Deacon and I had a couple of farms of 800 acres each, all paid for, and \$200 an acre working capital, we should not get up quite so early in the morning, or look so sharp after the men, or attend so closely to the details of the farm, or look to the state of the flocks and herds, as we are compelled to do now.

After lunch on the lawn, carriages and wagons, provided with seats, and drawn by Clydesdale horses, drove to the house. Mr. Crozier mounted his horse, Mr. Delamater drove one of the wagons, and we started to see the farm. Here is a thirty-acre field of clover and timothy, that had been cut a day or two before with three mowing machines. A two-horse tedding machine had been used to shake up the hay. It was then raked into windrows. Rain had fallen in the meantime, and now the tedding machine was going up and down the windrows at a sharp walk, and shaking up the hay, which dried so rapidly, that half a dozen men were following it, putting the hay in cocks for the night. The crop was a remarkably heavy one, I should think 2½ tons per acre, notwithstanding the fact that it was cut a week earlier than most of us here are in the habit of cutting our clover. It was capital hay. There was about two acres of the field, where the cocks stood far apart—so far, that I thought they might be rakings. I asked the Scotchman, who drove us, why this difference? "It was not manured," he replied, and this tells the whole story. Some 135 head of cattle are kept on the farm, 100 sheep, 50 to 100 pigs, and 35 horses. Sea-weed is gathered in large quantities, muck is thrown up in the winter, and when dry, is drawn to the yards to absorb the liquid and to be composted with manure. Large quantities of leaves are gathered for bedding, and I take it, though nothing was said on this point, that the bills for corn-meal, oil-cake, and bran, are not small. But all this time the procession is moving on. There is a bluff commanding a fine view of the Sound, and the distant shores of Connecticut. The field is in orchard grass and clover, ready for the machine, but we marched straight through it. The Deacon would have thought we were a set

of vandals, and he would have been greatly shocked when we came to a large field of rye, to see Mr. Crozier ride right into it, followed by the whole cavalcade, wagons with four-inch tires, carriages and all, sometimes two or three abreast, and wheeling round on the top of the hill, and marching back again. I hope Beacon Stock Farm does not often have such a set of visitors, or that the man who cuts that rye is not given to the use of strong language.

We passed a field of about 25 acres of mangel wurzel. They were as good, but no better, than my own—which was a consolation. They are sown on ridges, 2½ feet apart, and thinned out to 15 inches in the rows. The seed is drilled in with a Scotch, English, or Canadian drill (I did not ask which), four to six lbs. to the acre, the drill sowing two rows at a time. Some one remarked that the mangels were thin. "Did you ever see a thin crop of mangels," replied Mr. Crozier, "that was not a good crop?" It would not have been polite to have told him that I had. We want to have the plants come thick, and then thin them out to the desired distance—12 to 18 inches, according to the variety. Undoubtedly a great many crops are injured by leaving the plants too thick, and this was what Mr. Crozier meant.

There was also a magnificent field of sown corn for fodder. It was sown in rows, about 3 feet apart, and kept clean by the free use of the cultivator. The rows were as straight as an arrow. Mr. Crozier sets us all a good example in regard to straight furrows. I wish I could get my plowing done in this fashion. Mr. Crozier thinks we should have Scotch plows. I think it is due to Scotch or English plowmen, and not to the plows. I have got a Scotch plow on my farm, and it has lain under the shed for eight years. We like a Collins, or a Remington steel-plow much better. Still, I have no doubt that where the land is free from stumps and stones, there is an advantage in having long-handled plows. If so, our manufacturers can furnish them. There ought to be no need of sending to Scotland for plows.

The secret of Mr. Crozier's success can be told in two words: Capital and manure. It is not Scotch plows, or Scotch harrows, or even the Scotch "grubber," (which, however, struck me as the best implement on the farm, and one which I wish some of our manufacturers would introduce). It is manure. I would like to spend a week with Mr. Crozier, and study the details of his management. We know the value of manure, but few of us know how to make enough of it.

Edam Cheese.

Holland has been noted for the excellence of its dairy products for centuries. Its rich pastures, formed from lands which have been reclaimed from the bed of the sea, and which are in many cases far below its level, being preserved from overflow by broad high embankments, called dykes, support herds of the finest dairy cows. Dutch butter has a reputation second to none in the world, but it is for its cheese manufacture that Holland is most noted, and for which it enjoys an extensive demand.

Edam is a town of Holland, near the well-known Zuyder Zee, and about 12 miles north-east of Amsterdam. This town is the center of the manufacture of those nearly globular reddish colored cheeses, which are largely imported into this country, and sold in all the large cities

at from 30 to 40 cents a pound. Edam cheese, designed specially for exportation to foreign countries, is carefully made and will keep several years. It is, therefore, a favorite cheese for use upon ships making long voyages, and is almost the only cheese which is exported to India, China, and Australia. The fact that the American dairy factory system is being introduced into Holland, as well as into other European countries, and is thus made a means for more active competition with our own dairy products, would naturally make it desirable for us to learn everything possible as to their methods of manufacture, that we may, as far as may be, repay ourselves in kind for what we have bestowed, and not allow ourselves to be beaten with our own weapons in the dairy markets of the world. We have already taken the first place as makers of standard cheese, and favorably compete in the English market with English dairies. What is now necessary to enlarge our dairy business, is to succeed in the manufacture of fancy cheese, and secure the market for those kinds which cost but little more than common cheese to make, and sell for double and treble its price. There is a demand for small cheeses of high flavor, and the Edam cheese to some extent fills this demand. It is a cheese of three or four pounds weight, with a sharp, almost pungent, yet agreeable flavor, and, as we have already said, will keep for years. The process of manufacture, as described by M. Le Senechal, director of the dairy of St. Angeau, in Holland, is as follows: As the peculiar purposes for which this cheese is destined forbid the use of too rich a milk, and the presence of too much cream or butter in the curd, it is usual at the height of the season—that is from the middle of August to the middle of October—to skim from one-third to a half of the milk; at other times the whole milk is used. The milk brought to a proper condition as to richness, is placed in the vat, and raised to a temperature of about 90 to 92 degrees in summer, and 92 to 95 degrees in winter, when the rennet is added in the proportion of a quarter of a pint to 100 quarts of milk, or somewhat less, according to circumstances. The desired color, a light yellow, is produced by the admixture of a portion of annatto, the quantity depending upon the season, the richness of the milk, the quality of the pasture, and other incidental circumstances, which the skilled dairyman so well understands. The usual quantity is a tea-spoonful of a liquid preparation of annatto to a quarter of a pint of rennet. The liquid annatto used in Holland is about the same as that used in the New York factories. The rennet and coloring matter having been added to the milk, it is stirred for one minute and left to rest.

As soon as the curd is thoroughly set, it is cut into small fragments with a curd-knife, made of a number of fine wires fixed in a frame. This is done very carefully, lest the cream in the curd might escape into the whey and be lost. The curd is then gathered into a mass and freed from the whey, after which it is pressed by the hands into the molds, as shown in figure 1. In this process the workman fills each hand with curd and presses it together, reducing it to a soft cake, which he throws with force into the bottom of the mold. He repeats this process until the mold is filled, when the mass of curd is pressed together and taken out, and reversed three or four times until it is compact. The small holes seen at the bottom of the mold, in fig. 1, are kept clean to permit the whey to drain off. As soon as

the cheese is sufficiently pressed with the hands, it is taken from the mold and plunged into a bath of whey heated up to 122 degrees, for a space of two minutes. It is then again pressed into the mold, and shaped, wrapped in a fine cloth, replaced in the mold, and put in the press, the form of which is shown at figure 2. There is a great variety of presses used in Holland, the one here illustrated is that which is used at this dairy. The cheese remains in the press one or two hours in the winter, six or seven hours in spring, and about twelve hours in the summer. After coming from the press,

Fig. 1.—PRESSING INTO MOLDS.

the cheese is taken from the mold, freed from the cloth, and placed in the salting mold, seen at figure 3. This is intended to give the cheeses their final shape, which is nearly globular. The first day the upper surface of the cheese is sprinkled with salt, and the molds are placed in long, covered boxes, shown at figure 4, which are slightly inclined, so as to allow the whey, which drains from the cheese, to pass off through spaces in the bottom. These boxes are placed upon a stage. The second day the cheeses are taken from the molds, and rolled in a bowl filled with damp salt, and re-

Fig. 3.

turned to the mold, but in a reversed position. This process is continued until the salt has penetrated the cheese thoroughly; this happens in nine or ten days. The cheese, which has now become solid, is taken from the mold,

dipped once more in moist salt, wiped dry, and placed upon the drying shelves to cure. The shelves are arranged as seen in figure 5, and the cheeses are placed upon them in regular order,

Fig. 4.—BOX FOR EDAM CHEESE.

according to their age. Here they remain three months, being turned every day the first month, every second day the second month, and once a week during the third month. At the end of 24 to 30 days, they are dipped in a bath of tepid water (about 66 to 70 degrees), washed, brushed, and set to dry in an open place. When perfectly dry, they are replaced upon the shelves. Fifteen days afterwards they are again washed, dried, and greased with linseed oil, when they are returned to the shelves where they remain until sold for home consumption. When prepared for exportation, they undergo some further processes, to give them a lighter color upon the outside, and also to preserve them for a longer period. They are first scraped smoothly with a sharp knife, then, for the English and Spanish markets, they are rubbed with a mixture of linseed oil and annatto, which gives them a deep orange color. For the French market, or for shipment by sea, they are dipped in a bath of 6 parts of tincture of tournesol (*crozophora tinctoria*), one half part of Berlin rouge, and 10 parts of water. 36 lbs. of this preparation, costing \$2.50, is sufficient to color 1,000 cheeses. When the surface of the cheeses is dry, they are rubbed again with

Fig. 5.—CURING-ROOM FOR EDAM CHEESE.

the hot climates of the tropics. The chief necessities in curing these cheeses are dry air, a regular temperature of about 72 at every season, a current of pure air through the curing rooms, careful avoidance of damp air, on which account the north, north-east and east winds, which in Holland blow from the sea, are considered eminently injurious. The colstrum, or the first milk of a fresh cow, is unfit for use, and if the cows have been heated previous to milking, it is considered preferable to lose the milk than to use it for cheese. The Edam cheese manufacture is the most profitable of any in Holland, yielding about one-

fourth more than any other. 100 pounds of milk produce 10 to 11 pounds of cheese, which sells at the dairy for 16 cents a pound (160 francs the 100 kilogrames).

A Machine-made Ox-Shoe.

By reason of the excessive cost of a hand-made shoe, it is frequently the case that shoes remain on an ox, when they should be taken off and replaced, or the ox goes unshod, in either case to the discomfort or injury of the animal. Many an ox is tortured throughout the summer season, and compelled to work with tender feet upon stony roads, doing only half work in the meantime, simply because it will cost \$8 to \$12, and the loss of a day's time, to get him shod. Besides, the making of a good ox-shoe is a specialty, in which few blacksmiths are perfect, and one is often obliged, as we have been, to go ten miles from home to get an ox shod. Now we are glad to know this difficulty and cost may be avoided by the use of an improved machine-made, forged shoe, which is manufactured by the Greenfield Tool Company, of Greenfield, Mass., for the reasonable price of 15 cents per pound. The illustration shows the character of this shoe. It is an engraving of one half of the

MACHINE OX-SHOE.

Fig. 2.—PRESS FOR EDAM CHEESE.

butter mixed with rouge, and packed in boxes of eight compartments, each one of which holds a cheese. They are now ready for shipment, and in this condition may be preserved for several years without deterioration, even in

turned to the mold, but in a reversed position. This process is continued until the salt has penetrated the cheese thoroughly; this happens in nine or ten days. The cheese, which has now become solid, is taken from the mold,

turned to the mold, but in a reversed position. This process is continued until the salt has penetrated the cheese thoroughly; this happens in nine or ten days. The cheese, which has now become solid, is taken from the mold,

shoe, and is a little more than one-third the full size of the number 3-shoe, which weighs eight pounds the set of eight pair, a full set thus costing only \$1.20. These shoes are made of four sizes, six, seven, eight, and ten pounds the set, and are made wholly by machinery, the dies giving the necessary concavity to the shoe, to make it fit perfectly, and cover the ball of the foot without pressure. This is a very difficult thing to do with the hammer, and is a special feature of this shoe, the dies being patented. These shoes, fitting the foot perfectly, cling thereto much longer than a hand-made shoe, which rarely fits the foot, and besides they are so readily fitted, if the proper size is procured, that it is an easy matter for a careful hand, who can drive a nail in the place he wants to put it, to shoe an ox.

MOLD FOR OX-BOW

How to Bend an Ox-Bow.

Ox-bows may be given their permanent shape by such a mold as we here illustrate. It may be made of a piece of two-inch plank, cut to the shape desired to give to the bows, and pinned upon another piece of plank, or the end of a block, as here shown. A hole is bored on each side of the mold, into which pins are placed, to hold the bow firmly while it is receiving the set. The wood for the bow, after having been dressed to a proper shape, is soaked in water, and heated before a fire, by which it is rendered flexible; or it may be steamed in a steam-box, or soaked in a trough in boiling water. When the bow has remained in the mold until it is dry, it is removed, and the ends are tied together with a cord, to keep it in shape. It should be hung up in a dry place until used.

Sour-Fodder-making in Hungary.

The chief necessity of every dairy farm, or cheese and butter factory, is to feed a juicy

FIT OF SOUR-FODDER.

food to the cows at every season of the year; this is easily provided for in the spring, summer, and autumn, by feeding green rye, wheat, clover, a mixture of oats and peas, corn, etc., but in the winter we have no other milk-producing fod-

der than beets and corn-sour-hay. It is known to every farmer, how difficult is the preserving of roots in the winter, and that large quantities of them are injured and therefore spoil. To avoid this, we cure the beets and other roots with chaff into sour-fodder. This method of using root-fodder has been in use on large farms in Hungary for some years, and has always been successful. The method of making this so-called sour-fodder is as follows: at first we have a ditch made in a dry place; the ditch may be of the same dimensions, as was described for making sour-hay in the *Agriculturist* for October, 1873. When the beets are taken up in the usual manner, they are hauled in, washed, and cut with a machine. Then the pit may be divided into sections, for instance, for a length of ten rods into five sections, and by this division the labor is very much facilitated, because the first section can be covered with earth, while the second section is being filled. When a certain quantity of beets are cut, we place at first a layer of chaff upon the ground of the first section, upon this chaff is placed a layer of cut beets, in the proportion of one pound of chaff to ten pounds of cut beets; these two layers are then solidly mixed with a fork after having done so, a layer of chaff and beets is again laid down, and again well mixed. This is repeated until the mixture reaches the top of the ditch; then it must be built upward from six to nine feet above the level of the ground. On the top of the stack are laid a few sheaves of rye-straw, to prevent the fodder being mixed with earth; then the first section is covered with earth, commencing the covering at first on the top of the stack. When the first section is finished, the second and all following sections are managed in the same manner, as above described; when the whole ditch is filled, we take care that the stack is covered on every side with 1½ to 2 feet of earth. This sour-fodder, mixed with corn-meal or other feed, will be relished by the daintiest beast. The engraving shows the whole arrangement. The first and second section of the ditch is filled, the first one is also covered with earth.

Albrechtsfeld, Hungary. G. C.

[Although the fodder above described is called sour-fodder, yet it is not on that account objectionable; the fermentation, which the feed undergoes, produces some ammonia, so that really the mixture is to some extent alkaline, and this corrects any ill effects which might be supposed liable to arise from the acidity of the food. By the same process brewers' grains may be preserved for use during the winter, alone or with cut straw.]

A Convenient Barn for Sheep.

Unless sheep are carefully provided for, there is sure to be trouble and loss in the flock. It is probably for the reason that a single sheep is not worth much, and that they are ignorantly supposed to exist without water, or any fodder, but the waste of the feeding yard, and to thrive the better the more they are exposed to the weather, and to pine away the faster the more they are coddled, that so many of them are lost every year, and that so few farmers

succeed with them. But if we figure up how much money may be made, by good care, yearly out of \$100 invested in sheep, as compared with the profit from \$100 invested in cows, or a mare, the balance will be greatly in favor of the sheep. As an illustration of what may easily be done by any farmer, who will take the trouble, we give an account of the cost of,

Fig. 1.—FRONT ELEVATION OF SHEEP-BARN.

and receipts from, a flock of 55 common ewes, picked out of a drove, which was passing the writer's farm on its way to market, in the summer of 1868. The sheep were purchased at \$3 per head, and until winter were pastured in a rough field at the rear of the farm, where they more than earned their keep and care, by the service they performed. The account for one year, opened and kept expressly for this flock, is as follows:

Dr.	
Cost of 55 sheep	\$165.00
Value of hay, straw, stalks, turnips, bran, meal, and oil-cake, fed	205.84
Freight and charges on 24 lambs	7.92
Balance of profit and loss	145.64
\$524.40	
CR.	
24 early lambs sold at from \$7 @ \$10 each	\$192.00
8 lambs, @ \$4.50	36.00
12 lambs, @ \$3.50	42.00
8 lambs kept, @ 4.00	32.00
9 lbs. pulled wool, @ 30c	2.70
182 lbs. wool, @ 35c	63.70
52 sheep on hand (3 killed by dogs)	156.00
\$524.40	

This leaves a profit of nearly 100 per cent on the original cost of the sheep, and in addition a large pile of valuable manure, of which no account was kept; besides, some of

Fig. 2.—SIDE-SECTION OF BARN.

the ewes could have been sold in the spring at \$5 or \$6 each, to the butcher, but we had use for them for another year. The next year's account would have been more favorable still,

as all the lambs would have come in to sell early at the highest prices, but for a disastrous raid by the village dogs at an unguarded moment which all but destroyed the whole flock. But this disaster only exemplifies more clearly the point we desire to show, which is, that the greatest care (even against such a contingency as an attack by dogs), gives the greatest profit. It is during the winter season, that the most care and skill are needed, and but little success can be had without a good sheep barn. Such a barn, having many conveniences both for the flock and their owner, is here illustrated. It consists of a barn, shown at figure 1, about 20 feet wide, 16 feet high from basement to eaves, and as long as is desirable. This is intended to store the hay or fodder. The posts, sills, and plates are all 8 inches square, the girts and braces are 4 inches square, the beams 2 x 10, are placed 16 inches apart, and are cross-bridged with strips, 3 inches wide. The hay is piled inside, so that a passage-way is left over the feed-passage below, in which there are trap-doors. The hay is thrown down through these doors, and falls upon a sloping shelf, which carries it into the feed-racks below, (see fig. 2). The basement under the barn is 8 feet high, and is of stone on three sides; the front is supported by posts, 8 inches square, and 8 feet apart. Between each pair of posts a door is hung upon pins, (fig. 3,) which fits into grooves in the posts, so that the door may be raised and fastened, so as to close the upper half of the space between the posts, or held suspended half way, leaving the whole open, or be shut down and close the lower half, or be removed altogether. By this contrivance at least half the front of the basement must be

Fig. 3.—Door.

left open, whether the sheep be shut in or out. The floor of the basement should be slightly sloping from rear to front, so that it will always be dry. Fig. 4 shows the plan of the basement. The feed-passage is shown at *c*; the stairway to the root-cellar at *b*, and the root-cellar at *a*. Fig. 2 gives a section of the whole barn. The hay-loft is above, and the passage-way and the doors are seen, by which the hay is thrown down to the feed-racks below. The sloping shelf, by which the hay is carried into the feed-racks, is shown. Below the feed-rack is the feed-trough for roots or meal. A door shuts off this trough from the sheep at the front, while the feed is being prepared, and when it is ready, the door is raised, and held up by a strap or a hook to the feed-rack. The feed-rack is closely boarded behind, and this back part, which is in the feed-passage, slopes forward to the front, so as to carry the hay forward to the bottom. The front of the rack is of upright slats, smoothly dressed, two inches wide, and placed three inches apart.

Fig. 4.—PLAN OF BASEMENT TO SHEEP-BARN.

The boards of the feed-trough are smoothly dressed and sand-papered, and all the edges are rounded, so that there is nothing by which the wool may be torn or rubbed off from the sheep's necks. It will be seen by this

arrangement, that there is no dangerous thing by which a sheep or a lamb might be hurt, or place where it can get into mischief. The root-cellar is at the rear of the basement, and is reached by the stairs already mentioned. After having tried several different plans for sheep barns, we think this combines more conveniences than any other we know of. A barn, large enough to accommodate 100 sheep, may be built for \$500 to \$600, and the yearly interest on this sum would alone be paid several times over in the saving of lambs, that would be lost without such shelter and conveniences.

On Siphons and Water-Pipes.

The failures of siphons when used to carry water long distances over a rise of ground, are mainly due to two causes, viz., the admission of air into the pipe and an excessive friction,

PUMP ATTACHED TO A SIPHON.

which greatly retards the current. The readiness with which a very small imperfection in the inner surface of a pipe will retard the flow, may be estimated when we learn that a mere scratch in the discharge nozzle of a steam fire-engine pipe, so small indeed as to be overlooked by the workmen who finished it, was sufficient to reduce the throwing power of the engine from 200 to 150 feet. This surprising effect of so small a cause could hardly be believed, were it not vouched for by so accurate a man as Professor Tyndall, at a recent lecture on "Liquids" at the Royal Institution of London. We can not wonder, then, that in the passage of water through 1,500 feet of half-inch pipe, the flow should be altogether arrested by the friction, and not even a drop be discharged at the lower end, except at intervals. It is, therefore, necessary, when small sizes are used, to exercise great care in selecting pipe for the conveyance of water, and in place of the common lead-pipe to use the tin-lined pipe, the inner surface of which is very smooth. This retardation of the flow in a siphon may cause air to enter the pipe, but a considerable quantity of air is always dissolved in water, or mixed with it, and in flowing through the pipe some of this air separates from the water, and gathers at the highest part of the curve, and as soon as the quantity collected is sufficient to fill the pipe for even an inch of its length, and the continuity of the stream of water is broken,

the current is disturbed, a constant gurgling of the air in the pipe is heard, and very soon the stream stops running. This is the chief difficulty complained of by several correspondents, who have asked for a remedy for the trouble. The remedies are, first, in procuring pipe for a siphon, that kind should be chosen which has the smoothest surface inside. Second, in laying the pipe it should be carefully straightened, and no sudden curves be made in it; nor should any parts of it, that may have been accidentally damaged or squeezed out of shape, be allowed

to remain, but they should either be brought to their proper form, or be cut out and the pipe joined again. It must be remembered that if the sides of a pipe are squeezed together, the capacity of the pipe is reduced less or more, according to the amount of flattening, and if one part an inch long is thus reduced in size, the capacity of the whole pipe is reduced. Third, in making the short bends at either end of the pipe, which may be necessary for any purpose, the greatest care should be exercised to avoid flattening the pipe. A perfect bend may be made by pouring fine sand, made dry by heating it in an oven, into the pipe, until the part to be bent is completely filled. Then a perfect bend may be made without reducing the diameter of the pipe in the least. The dry sand may be very easily run out of the pipe afterwards. Fourth, after all these preventive measures have been carefully applied, and the pipe is laid, a method of removing the air may be used as follows: a piece of the pipe should be soldered near the lower end, and a common brass-tap fitted to it. A chamber is to be made in the ground, to contain this upright piece of pipe and tap. A screw is also soldered to the end of the piece of pipe, by which a small double-valved syringe or pump, with a discharge for the water, may be attached. When the presence of air is suspected or known in the pipe, this small pump is screwed on to the end of the upright piece, the tap is opened, a plug is fitted into the end of the water-pipe, and the small pump rapidly worked. The greatly increased flow brings down with it all the air that may have collected in the upper part of the pipe, the plug is removed, the tap shut, the pump unscrewed, and all goes well again. The proceeding occupies less time that is needed to describe it. The method is here illustrated. The engraving shows the chamber, with the arrangement of the pipe, tap, etc., and also the part of pump that is needed, which may be a very cheap one.

The Outlet to a Swamp.

BY GEORGE E. WARING, JR., OF OGDEN FARM.

I have recently been employed to do the engineering of a piece of swamp draining in East-

OUTLET TO A SWAMP-DRAIN.

ern Massachusetts, and as the case presents difficulties, which are very common, it will perhaps interest others to know how the work is being done. The swamp is in a "pocket," and was originally a pond. It was drained by a stone trunk-drain, about 900 feet long, much of which was twenty feet deep. To make such a drain at the present price of labor, would cost \$1,500, as the digging was very difficult. The cost of making the huge stone-drain, which was many times larger than necessary, was so great, that distance was very important, and the straightest practicable line was followed. True to the nature of all stone-drains, this one, after twenty years use, has gone to the

bad. It has caved in, and become choked with surface rubbish, until it is nearly useless, and the swamp is returning to its condition of a stagnant pond.

The area to be drained is only about ten acres, but it lies directly in front of a fine residence, and must be made dry without regard to the agricultural value of the improvement. I find that by following a devious line, and increasing the length to about 1,100 feet, the drain can be made with very much less cutting, and through less difficult ground. The average cut will be about 8 feet, a small tunnel being made under a road where before it was necessary to cut 21 feet deep and 5 feet wide on the average.

The drain will be laid with 6-inch drain tiles, and the whole cost will not exceed \$450. This will secure an absolutely permanent drain, costing, with interest at present rates, say \$35 per annum. The \$1,500 stone-drain has become worthless in about twenty years. It has cost—interest and depreciation—about \$150 per annum.

The outlet of this drain will be protected by cheap masonry, and a grate to exclude vermin. The great point of danger is the *inlet*. Mud and floating rubbish must be kept out, or the whole drain may become worthless. This will be prevented by the arrangement shown in the illustration. At the side of the swamp toward the outlet, there will be a stout retaining wall of rough stone-work, to support the earth needed to protect the tile. Adjoining this will be a round well of brick or stone, 4 feet in diameter and 3 feet deep. The top of the wall of this well will be level with the bottom of the tile where it passes over it, so that it will be the thickness of the tile, say $\frac{1}{2}$ inch, below the surface of the water. The upper end of the drain will be furnished with a curved joint of pipe, turning down about one foot into the water. Thus the inlet will be below the reach of floating rubbish, and well above the sediment which accumulates in the well, and which can be removed from time to time.

To secure the free admission of as much water as the tile is capable of carrying, the inlet will be 10 inches in diameter, narrowing to 6 inches within a few feet.

Arrangement for Hurdles.

As the season is at hand for hurdling sheep, we give the accompanying illustration and description of a method of placing the hurdles or nets, by which the least labor or length of hurdles or nets need to be used. We suppose a square field of 10 acres is to be fed off. The distance across the field is 220 yards. This is the least length of hurdles that can be used. But if the field is divided off into strips across, the whole of the hurdles must be moved each time, and if the field is divided into eight strips, there will be seven removals of every hurdle, or the whole length of netting. In the plan here shown, only half this work is necessary, and a field may be divided into eight sections by moving half the hurdles seven times. For instance, plot 1 is fed by placing the hurdles from *a* to *b*, and from *c* to *d*. Plot number 2 is

ARRANGEMENT OF HURDLES.

fed by moving the hurdles from *b* to *e*. The next setting of the hurdles is from *e* to *f*, the next from *b* to *g*, the next from *h* to *i*, the next from *b* to *h*, the next, and last, from *l* to *m*. There will be eight settings of 110 yards each, instead of seven of 220 yards each, which would be necessary, should the field be fed off in the usual manner of strips across it.

California Tobacco.

It would seem as though tobacco planting in California is destined to have a great influence upon the profit of the crop in the East. The planting is rapidly increasing in California, year by year, and the product is enormous. There are two or three cuttings in a season, and some planters speak of 4,000 pounds per acre, or more, as the yield of their plantings. One planter in Lake County, has nearly 300,000 plants set out this season, an incorporated company have a million plants set out in Los Angeles County, and nearly as many in Santa Cruz County. Besides these there are many other large planters, and more smaller ones. In addition to the large plantings and prolific yield, a process of curing is there practiced, by which the tobacco is quickly prepared for market, and its value increased. This is known as the Culp process, and is patented. The tobacco yet green is piled up and allowed to ferment and heat. The moisture is thus rapidly expelled, and the character and texture of the leaf is improved. If the anticipations in which the California tobacco growers freely indulge, are only partly verified, it will give rise to a serious competition, which Eastern growers may find too formidable to resist. If this should be the result, however, we do not think there is any reason for regret, as we believe Eastern farmers will find, in the long run, wheat, corn, and grass, to be more profitable to themselves and their land than tobacco.

Cramming Poultry.

It is altogether a vitiated taste that creates a demand for over-fattened meat. There is no nutriment in fat, and with the large consumption of sugar, syrup, and starchy food, that is common among us, the necessities of the system for carbonaceous food are fully, if not over supplied. The use of excessively fat food then is a waste of material, and it probably induces some of the bilious disorders which are so common. With regard to poultry these remarks are especially applicable. The markets of the cities are filled with fowls that are lined with fat, a useless addition that is a loss to the consumer, and its production has been at the expense of a waste of food to the feeder. Besides, housekeepers complain of these over fat fowls, that they are deficient in delicacy of flavor, and are coarse and greasy, thus losing in quality as well as in weight. This matter is in the hands of farmers themselves to remedy. They alone decide as to what degree of fatness their fowls shall be brought, or rather, not knowing exactly how fat they are, they continue to feed them much too long for their own profit. A very thin fowl can be brought into good condition for the table by three weeks' feeding. Generally a fowl from a grain-stubble or a barn-yard at a time when waste grain is scattered about liberally, as well as at other times, when the housewife undertakes the feeding of the poultry, is sufficiently fat for the

market, without extra feed. If poultry is marketed at the age of two years, and none older than that kept, the quality of the flesh will be all that can be desired, without any cramming or extra feed, and the extra fat that is laid upon an old fowl, is no addition to its goodness, but rather adds to its bad qualities. A good judge of poultry looks to the age of a fowl, and passes by the old birds that have been crammed to fit them for market.

The Transportation Problem—Steam on Canals.

Transportation by water has ever been, and probably ever will be, the cheapest method of moving heavy freight. Natural water-ways, such as oceans, lakes, and rivers, are obviously the cheapest of all, as they cost nothing to construct, and next to these come canals, which are simply artificial rivers. It remains then only to provide the most economical mode of carrying freight upon these natural or artificial water-ways, to secure the cheapest system of transportation. But while this general proposition is simple enough, there are other considerations which affect the question and give rise to difficulties, which give to this seemingly simple business the character of a problem. For instance, there is the storage and transfer of grain and other produce in the west, the transfer of freight from lake vessels to railroad cars, and canal boats, the intermediate and temporary storage when that is necessary, the conveyance, heretofore necessarily slow, upon the canals, and the final disposition of the freight when it has reached tide water, and is awaiting shipment. All these matters involve delay and cost, and it is upon the perfect management of each, and the economical working of the whole together, that the final successful solution of the transportation problem depends. That system which will use the means we have in such a manner as shall cost the least money to the shipper of the freight, will be the best possible one. The time occupied in the transit of produce is a large element of cost, because time is money, and every hour's unnecessary delay adds to the expense. In the water-route from the lake-ports to those of the Atlantic, there has been hitherto a link, or rather a break, consisting of the Erie and other canals, which has added greatly to the cost of transporting grain, as compared with what that cost would have been could this break have been avoided. This weak link, or break, in the continuity of the routes, of comparatively insignificant length, caused the greater part of the expense of shipping a cargo of grain from the west to the east, by reason of the slow transit of freight upon it. It has, therefore, been a matter of great interest to have the canal system so improved, that it should be made equally economical with the lakes and the Hudson river. The use of steam in place of horse-power has long been viewed as the chief improvement to be made, and the State of New York, the owner of the canals, offered a premium of \$100,000 to the inventor of the steam canal-boat, which should succeed in transporting freight at the minimum of cost. In the competition for this prize last season, several boats of different construction were presented. The most successful of these, and that which made the most rapid trips at the least cost, was a boat designed and built by Mr. William Baxter, of Newark, N. J., the inventor also of one of the most compact, safe, elegant,

and economical, portable steam-engines as yet constructed, known as the Baxter steam-engine. The New York Legislature, at its last session, completed its share of an arrangement by

Fig. 1.—SIDE-VIEW OF TRAP.

which \$35,000 of the premium money is awarded to Mr. Baxter, on condition that 20 of his boats are placed upon the canal immediately. This will be done, and the present season will see steam navigation inaugurated, and the use of horses and mules dispensed with, or at least a beginning made towards this desired result.

The economy of this new system is great, and will largely reduce the total cost of grain transportation. The official report of the trials of the Baxter canal-boat credits it with a speed of 31 miles in 10 hours, or 74 miles in 24 hours, with the almost incredibly small consumption of less than 15 pounds of coal per mile, when carrying 200 tons of freight. The speed is doubled, and the cost of carriage is reduced one-half, which makes the cost of freight by these boats only about one-fourth that of the boats drawn by horses. The Commissioners who superintended the trials, estimate the saving on the business of the Erie canal alone at four millions of dollars, and on all the canals of the country at ten millions of dollars. Besides, as two tons can be carried over the canals where one was carried before, without extra expense, the value of the canals, just as soon as the new boats can be made to replace the old ones, will be doubled. It is difficult to estimate the advantage which the agricultural interest will gain from this improvement, but it is well worth while to consider, especially at the present moment, how this interest is dependent upon the ingenuity of inventors, the skillful labors of mechanics, and the beneficent uses of capital. Without either of these, or all of them combined, the agricultural interest would depend solely upon itself, and in that sole self-dependence would be reduced to insignificance and helplessness. How closely every industrial interest is bound up with the thoughtful brain of the inventor, and both

with capital, which is only another term for accumulated work or industry, is here very clearly shown. The Baxter canal-boat, as may be seen in our illustration, is not very different from an ordinary boat in its capacity or construction, except that it carries its own motive power in the hold. With the contemplated enlargement of the canals, increased efficiency will be given to steam transportation.

A Permanent Rat-Trap.

It is hardly safe to venture an estimate of the amount of grain yearly destroyed by rats, because we might be so far under the mark. We know a case in which the corn crop of a field of 13 acres was put away into a mow with the cars on, so that it might be cut up together and steamed for the stock, and three-fourths of it was destroyed by the rats, and rendered useless. This is an extreme case, but the damage to corn in eribs and unthreshed grain in barns is vastly greater than farmers generally suspect. It is true that these pests are hard to get rid of, that they are sagacious and cunning, and that their perseverance is remarkable. But a man should know more than a rat, and he has but to exercise equal perseverance with these enemies to vanquish them. Where it is possible, the best thing to do, is to remove every hiding place by elevating the buildings upon posts or pillars of brick or stone, and letting daylight beneath them.

outhouse, or a quiet part of a barn or stable. It consists of a long narrow box, three or four feet long, and six or eight inches wide and deep. This is set upon another box about 30

Fig. 2.—SECTION OF TRAP.

inches high, with sloping sides, so that the first box forms the top part of the second box; the first box is open at the top for about a foot at the rear end; all this is seen at fig. 1. This open part is partly filled with corn or corn ears. Immediately in front of this part there is a loose bottom neatly fitted upon pins, so that it will open downwards with the weight of a rat. A piece of lead is fastened to it to keep it in position, or restore it to its place after it has been disturbed. The front of the box is partly hidden with a couple of sheaves of corn stalks or rye straw which furnish a ready means of access for the rats. At the bottom of the second box there is a narrow box or tube fitted, which leads through the wall of the building into a barrel half sunk into the ground outside, as shown in fig. 2. A loose trap is also fitted at the end of the tube. The barrel is covered with a wide board with a hole in the center to admit the light. A few pails full of water are put into the barrel. At first the loose bottom is pegged fast and the rats

BAXTER'S PRIZE STEAM CANAL-BOAT.

Rats love darkness, and will not harbor or breed in places where they are exposed to view. The pig-pens, which are favorite resorts for them, should be raised well up above the ground, and the pigs will be all the better for it. The stables should have paved floors, and the sills should be placed on a brick underpinning. The barn, if there is no basement, should be raised upon pillars or short walls two feet high, so that dogs or cats can get under them. If this can be done, and every rat that is seen is hunted down perseveringly until it is caught, the pests will desert the place as being unwholesome for them. Where thorough work is not possible, they may be induced to desert their quarters by one or two effectual raids made upon them by means of the contrivance which we here illustrate. It should be set up in an

quickly finding out the way to the corn, are allowed to gather there for a week or two, and are fed liberally. When they have taken full possession, the pegs are taken away, and the pivots are greased, and the rats are caught one after the other. As they find their way to the barrel, attracted there by the light, which they can see through the tube, they are drowned and their bodies may be scooped out daily. The number caught in this way is astonishing, and for a time afterwards few, if any, rats will be seen about the place. Then the pegs may be replaced, and the rats encouraged to gather again. The contrivance is a permanent one, and will pay for the attention it requires. It is not a new thing, and has been used with great success for many years, but is probably new to most of our readers.

Succulents as Decorative Plants.

BY CHARLES H. HOVEY, CAMBRIDGEPORT, MASS.

SECOND ARTICLE.

Among the succulents, the *Sempervivums*, next to the *Echeverias*, demand our attention as being the most useful—the hardy varieties for the garden, and the tender ones for both greenhouse and garden decoration. As indicated by the name *sempervivum*—"always liv-

Fig. 1.—TREE HOUSE-LEEK.

ing"—they are extremely tenacious of life, appearing to stand equally well the hot and the cold, the wet and the dry weather, and increasing very rapidly. This genus is well known in the old House-leek, which, in Europe, was formerly grown by royal edict on the thatched roofs of houses, on account of its supposed power to avert lightning. The succulent leaves of this common species were formerly supposed to possess curative properties. There are very many species and varieties, hardy and tender; the hardy ones are all stemless, and present a great contrast in habit of growth, as well as in the color of their leaves and flowers. Many are worthy of cultivation from the effectiveness of their flowers alone.

For the edging of flower-beds, or figures, for lettering, or rock-work, and for edgings, the *Sempervivums* are in every way desirable.

The tender species differ greatly from each other in shape and style of growth, and are exceedingly ornamental for the greenhouse, as well as indispensable for the garden in making a bed of succulents, or if scattered among a group of miscellaneous plants, they give a certain novel and striking effect, which we find in no other class of plants. Most of them are

Fig. 2.—TABLE-FORMED HOUSE-LEEK.

very symmetrical in their growth, and form fine single specimens for the greenhouse; they vary in height from six inches to six feet.

Of the tender kinds the following are enumerated as a few of the most desirable: *Sempervivum arboreum*.—This (figure 1) is one of the best known; it has a regular tree-like growth, attaining the height of five or six feet. The leaves, of a light green, grow in rosettes upon the extremities of the branches.

S. arboreum rubrum is similar to the above in general appearance, except in the color of its leaves, which are deeply tinged with red.

S. arboreum variegatum.—Similar to the two preceding, the leaves being broadly margined with bright yellow, and green in the center. One of the finest variegated-leaved plants.

S. arboreum medio-luteum.—Another variegated form of *S. arboreum*, having the yellow variegation in the center of the leaf, upon each side of which is a margin of green.

S. tabulaforme.—This is the most distinct of the *Sempervivums*; it is called the Table-shaped *Sempervivum*, on account of its manner of growth. It is of dwarf habit, with its top perfectly flat, the leaves being as close together as if pressed. We have a specimen six inches high and ten inches in diameter, and as flat as a board, as in figure 2. A very desirable kind.

S. Canariense.—Somewhat similar to *S. tabulaforme* in growth, but with larger leaves than in that species, and the cluster is slightly concave.

S. Heworthii.—A dwarf, free branching species, producing small clusters of leaves at the extremities of the branches, the plant forming one large round cluster of small tufts.

S. Youngianum.—A tree-shaped variety, with very wide, flat leaves, somewhat after the style of *S. tabulaforme*. Very distinct.

S. decorum, *S. ciliare*, *S. glutinosum*, *S. rubicum*, and *S. cholochrysum*, are all very good kinds, and worthy a place in any collection.

Of the hardy *Sempervivums*, those which are

Fig. 3.—COBWEB HOUSE-LEEK.

most distinct and desirable, are the following:

S. arachnoideum.—This, called the Cobweb *Sempervivum*, is one of the most curious species; it has the peculiarity of being completely covered and interwoven from tip to tip of the leaves with filaments like a spider's web. It grows in very compact clumps, as shown in figure 3, and gives a very striking effect.

S. tomentosum, and *S. Lagerrii*, present the same peculiarity as *S. arachnoideum*, though in a less marked degree. The leaves of both are green, but in *S. tomentosum* they change to a dull red in the spring; both are desirable.

S. calcaratum, improperly known in collections as *S. Californicum*, is one of the best of all the hardy species; its leaves are bright-green, deeply tipped with red. Fine for bedding.

S. soboliferum is called the "hen and chickens," for the reason that the young plants which it produces, are as regularly placed around the old rosette as if planted by hand. *S. hirtum*, shown in figure 4, as also *S. tomentosum*, present the same peculiar growth.

S. tectorum.—This is the regular roof House-leek before alluded to. A large and remarkably robust grower and a distinct species.

S. umbilicum chrysanthum.—This is very dwarf and branching, producing a number of

small, round heads, with the leaves incurved.

Very distinct. We may here mention

S. acuminatum, *S. Braunii*, *S. globiferum*, *S.*

FREE-FLOWERING ANDROMEDA.

heterotrichum, *S. montanum*, *S. Pittoni*, *S. pilosella*, *S. Reginae Amalie*, and *S. violaceum*, as all distinct and good. There are some fifty more, all different and perfectly hardy, which present their peculiarities of growth and color more fully in the spring. The *Sempervivums*, as a whole, are very desirable. They are easily taken care of, requiring very little attention, especially the hardy ones, which, when once planted, are quite able to take care of themselves.

The Free-flowering Andromeda.

Andromeda is a beautiful name, which Linnaeus gave to a genus of charming plants. Later botanists, for reasons which seemed satisfactory to themselves, split up the genus into several new genera, and while some place the beautiful Free-flowering Andromeda, *A. floribunda*, in one of these newer genera, *Leucothoe*,

Fig. 4.—HAIRY HOUSE-LEEK.

and others in another, *Zenobia*, we are glad that our best American botanists, like Gray and Chapman, retain this as an *Andromeda*. Some of the *Andromedas* are deciduous, but this is an evergreen shrub, found from the mountains

of Virginia southward; it grows from two to ten feet high, and flowers even when only a foot high; it is very densely clothed with leaves, and on that account would be a desirable plant, did it not flower at all. The lance-oblong, acute leaves are about two inches long, with bristly teeth on their margins; the flowers are in large, dense, pyramidal clusters at the ends of the branches; the individual flowers are about the size of those of the huckleberry, contracted at the throat, five-angled, and of a pure white, which shows finely against the dark-green foliage. The racemes, or flower-clusters, are formed during the summer, and by winter appear almost ready to bloom; being so far perfected, a few warm days in spring cause them to open. Although the buds are so well advanced, the shrub is hardy in the climate of New York, and on account of its beauty of foliage and flower, would be a popular plant, could it be readily obtained. This *Andromeda* is a favorite in England, and failing to obtain it from our own nurserymen, we had to send to England for it.

Indeed, as strange as it may seem, the easiest way to get many of our native plants is to order them from abroad. Our nurserymen are not to be blamed for not keeping those things for which there is no demand; and with many buyers there is no surer way to condemn a plant, than to tell them it is a native. As to this plant, one may search a long while among the exotics before he finds a prettier early spring-blooming shrub. It can be propagated but slowly by layers, but more readily from young wood. Its slow growth may account for its not being in favor with our nurserymen, as buyers are unwilling to pay more for slow-growing things than for those that can be rapidly produced. In England this is a favorite plant for forcing; its well developed buds readily opening when the plant is brought into heat during the winter months. Much attention is given abroad to the decoration of dinner tables, and a well-shaped *Andromeda* in full bloom is a choice plant for this use. The plant seems to be about as patient of disturbance as a *Rhododendron*; of the half dozen received from England, a part had bloomed in the box on the passage. The others flowered as soon as set out, and all grew away as if nothing had happened to them. The engraving is from one of these specimens, and about half the real size.

Notes from the Pines.

Several have asked what has become of my "notes." There has been a plenty to say, but I do not think it fair to occupy the floor every month, when there are others who wish to be heard. One trouble about these notes is, that your arrangements for printing require them to be written so far in advance of their publication, that matters of present interest become quite old by the time they reach the reader. For instance, I am obliged to write the notes that will appear in August, soon after the middle of June, as you say your "inside," whatever that may be, goes to press on the first of July. Now I would like to say a word about the

AMERICAN WISTARIA, but it will be quite out of date next August. As I look from the window of my "den" this warm June afternoon, I see a perfect horticultural exhibition on the gable-end of my barn: the doors to the

carriage-house and to the tool-room are both grandly wreathed, and the vine gracefully disports itself elsewhere. The Chinese *Wistaria* is deservedly popular, on account of the earliness of the large clusters of its purple flowers. I have it, and its varieties, but were I restricted to a choice, I would take the American, *Wistaria frutescens*, and its white variety, in preference to the foreigners. The Chinese *Wistaria* flowers as the leaves are just opening, there is an abundance of flowers, with a poverty of foliage, and the bloom is not of long duration. The American, on the other hand, bides until it has made a dense mass of well-developed foliage, and over this it hangs its clusters of flowers, which are much smaller in bunch and individual flower than the other; the clusters are more compact, the flowers of a firmer texture, of the most delicate lilac color, and charmingly fragrant. In addition to all these it is American, and while I think none the less of a plant, because it is exotic, I am trying, in my quiet way, to have other plants thought none the less of, because they are native. The genus, wherever it may come from, commemorates Doct. Caspar Wistar, an eminent surgeon and anatomist, of Philadelphia. . . . Now is the time for building and repairing greenhouses. I am sure there would be a hundred greenhouses, where there is now one, if the matter of heating were simplified. In the old way of heating by a flue, one must be constantly on the lookout, and be ready, if need be, to get up in the middle of the night, and attend to the fire. Hot-water apparatus is much more easily cared for, but for small houses has been too expensive for those of moderate means—and these are usually the most enthusiastic flower growers. When I built my greenhouse (24 x 11) last fall, I put in one of the

BASE-BURNER WATER-HEATERS, made by Hitchings & Co., 163 Crosby-st., New York. Although we had but little extreme weather last winter, I am sure the apparatus would have heated a house one-half larger, if not one twice as large; indeed, the great trouble with it was to keep the heat moderate enough for the greater part of the winter. It is no more trouble than an ordinary base-burner stove; in mild weather it needs attention only night and morning, but when it was quite cold, it was looked after at noon. In this heater Hitchings & Co. have done much toward solving the problem of heating small greenhouses, and it is not easy to conceive of an apparatus that will work more satisfactorily, with a less consumption of fuel. [This heater was described and figured in September, 1873.] . . . In laying out my place, I consulted the public so far, as to put a low fence along the road, and to line that with low-growing shrubs, some of which are in flower all through the season, and present a cheerful appearance to those who pass by. I know that this gratifies many people, for they often slacken their pace, and if any one is in sight, stop to ask the names of the plants. The pleasure from this is, however, quite neutralized by a set of pedestrian vandals, who reach over the fence, and break off my shrubs in the rudest manner. What shall I do? I can prosecute these heathens, for I know who they are, and thus make enemies who will annoy me in other ways; shall I put up a board fence, and hide my shrubs, or shall I move them all to the rear, and leave a naked front? I'm in a quandary. Another quandary of mine is: shall the coming man be a horticulturist? As it stands now, the insects are a little ahead, but what

will it be fifty years from now, if matters go on as at present. The saying that

"HORTICULTURE IS A WAR WITH INSECTS" is no figure of speech. Go into the vegetable garden: would you asparagus?—beetles; would you radish?—maggots; early cabbages and cauliflowers?—green worms and lice above ground, and club-root below. Would you cucumber?—the "flea" and striped-bug have something to say on that. If you like peas, you must also like *Bruchus pisi*. If you would—as all reasonable people should—make your pumpkin-pie out of squash, your chance for the delicious Marrow, Hubbard, or Marblehead is small, if you do not pick off that solemn and odorous bug, *Corvus tristis*, so as to leave the vines in good condition for the borer, which goes near the root of the matter, and the 6 or 8 feet of vigorous vine that your care has preserved, goes in a night. Tomatoes and egg-plants you grow to feed a fat fellow, as big as your finger, and so all through the catalogue, from the time the first asparagus-shoot comes through the ground, until the last parsnip is dug. Nor is it any better in the fruit garden. You have grown your strawberries in hills for two years, and now look for a grand crop; they were white with flowers, the fruit set finely, but you find that here and there a vine has collapsed; the next day more vines give out; you dig down, and find a fat, white grub, which likes what the strawberry produces below ground quite as well as you do that which it bears above. The majority of the strawberries may fail, but there are the currants, which set so full and are already ripening. Look at your early ripened currants, and they will be found to be still small, and have only turned red, because the borer has taken the life out of the stem. Rose-bugs will eat up the grape-blossoms, curculios sting the cherries and plums, and if there are any pears and apples this year, it will be because there were not enough of the codling-moth and its allies to go round. Take the ornamental parts of the grounds. Upon about one-half of the shrubs there will be some kind of an aphid to curl up and partly kill the leaves. You are fond of roses, and precious few do you get. You fight the early green fly with tobacco water; the later slug is dosed with whale-oil or carbolic soap, and when these are in a measure vanquished, and buds of promise come, you go out one morning, and find six or eight rose-bugs at every opening rose, and those which can not get a chance at the opening ones, are discounting the matter by gnawing the buds. If you believe any thing will trouble these fellows, just try it. As I do not expect to live anything like half a century longer, I can worry along, and take the few vegetables, fruits, and flowers, these winged scourges and their larvæ leave me, but my trouble is, as this destruction increases yearly, to guess what will be the state of affairs in years to come, unless something is done to arrest this devastation. Unless united action can be had, individual effort is useless. The Apaches, who make their raids upon the borders of northern Mexico, steal judiciously, a few horses here, and a few cattle there, but never break up the settlement, as that would be, so to speak, destroying the nest-egg. Our insects seem to have some such instinct, and they do not, as the grasshoppers of the West, make a clean sweep, but leave us just enough to encourage us to go on and provide food for their progeny of next year. One person can do nothing; my neighbor on one side says: "My man tells me

that the worms are eating up his cabbages." My neighbor on the other side says: "Well, I never *did* see anything like it." But neither do the first thing to kill the pest. What good does it do for me to dust, and powder, and squirt all the remedies I can hear of—and I do kill some—while on each side of me there is ample provision for next year's insects. If a State has a right to legislate against Canada thistles, have they not the same right to make laws to prevent the increase of the squash-bug, the rose-bug, the codling moth, or any other controllable insect, that now takes the larger share of our vegetables and fruits, to say nothing of our flowers. I did not intend to make so long a "preach" about insects, but I am well persuaded that it is the duty of every State to look to this matter, as one affecting its material interests, as much as vile weeds, stray animals, or horse-thieves. Missouri has set a grand example to the older States. She has as State Entomologist, a competent man, to tell the people which insects are injurious, and how they may be fought. I hope that after a proper time for this knowledge to be disseminated, she will set a still better example, and make it a penal offence for any one to harbor and allow to multiply any preventible insect.

This spring I have had a great show of

FLOWERING SHRUBS, and am more than ever convinced that not half enough attention has been given to these. The most of my shrubs have now been out for four years, and being well established, they flower with wonderful profusion. A good selection of shrubs can be had at 25 to 50 cents each, just about the price of some bedding plants, which last only a season, while shrubs are practically for a life time. If asked to name twelve of the best, I should be puzzled, as the number is not large enough to comprise all the really desirable things. If my list were twelve, six, or even three, I know three that I could not leave out: *Weigela Deboisiana*; *Deutzia crenata*, the double; and *Hydrangea paniculata grandiflora*. Of all the Weigelas, and I think I have them all, Debois' is by far the finest; it is so floriferous that each stem is a dense mass of dark rose-purple flowers, and neither stem nor leaf to be seen. A bush which stands up well above the fence, was, when in flower, a bright landmark, that could be seen a long way off. The double Deutzia is not so showy, but is one of those charming shrubs, that one is never tired of. Its flower-buds are purple-tinted, and the contrast of the unopened buds at the top of a cluster, with the pure white of the fully opened ones below, is very pleasing. As to the Great-flowered Panicle Hydrangea, I have praised that so often, that I am afraid it will be thought that I have plants to sell. As I have but one plant, and that the largest I have seen, and never sold a plant of any kind in my life, I may be allowed to say that if restricted to just one shrub, it would be this. It only comes in August when most shrubs have got through. As I write we are in the midst of the

STRAWBERRIES.—If any one wishes to know how many worthless strawberries there are, let him set out every kind he can get. I did so for my own instruction, but while this kind of planting is very edifying, it makes a poor show on the table. I at first thought that I would keep up a collection of all, good and bad, but needing the land for other purposes, and considering that Dr. Hexamer was keeping up a standard collection—many thanks be to him—this spring a large lot of my fancy sorts went

under. I thought we should be nearly without strawberries this year, as a bed for fruit, put out in another place, could yield nothing until another year; but much to my surprise, we have had all the berries we could eat. The main reliance had been upon four rows of Chas. Downing, each 35 feet long. A row of the Black Defiance—most excellent berry—has helped, but the rest, a dozen or more sorts, count for nothing. Two rows of Kentucky are coming on, to prolong the picking, and instead of scarcity, we have had abundance. If there is any better berry, upon light soil, for family use, than Charles Downing, I am desirous of knowing what it is. It is good to know that a name so highly esteemed, is in this case properly bestowed, and the fruit is a precious legacy, left us by that excellent man, the lamented J. S. Downer, of Kentucky. Upon my soil, varieties in high favor elsewhere, are quite useless. In this class, I am sorry to be obliged to place a berry that bears so high a name as President Wilder, but we can console him by saying that Napoleon III is no better. Kissena, a prize-berry of a few years ago, is on my bed as small, sour, and worthless, as a fruit can be; and so I might go on enumerating a long list of the kinds, that are not worth growing upon my light sandy soil, no matter how well they are fertilized.

Some New Varieties of Strawberries.

New varieties of Strawberries are not so numerous as they were a few years ago, yet each season brings out some novelties. There are several enthusiastic amateurs, who are quietly at work in the hope of producing a better berry than we yet have. Prominent among these is Mr. E. W. Durand, of Irvington, N. J., to whom we are indebted for Black Defiance, and some others. Mr. D. each year raises some thousands of seedlings, and also tests several thousands of previous years, and thus performs an amount of labor that few would be willing to undertake. Mr. Durand is very careful not to send out any seedlings, until they have been tested for several years. A few weeks ago he exhibited at our office a half dozen new varieties, either of which would have made a sensation a few years ago. One of these novelties in particular will doubtless be heard of hereafter. This berry, in size and quality combined, has probably not been equalled, and Mr. Durand gives an excellent account of the plant. The variety has not yet received a name, but fruit-growers will be glad to know that Mr. Durand still continues his labors, and that there are some fine results in store for them.

THE DUCHESS.—Last year Dr. Hexamer, of New Castle, Westchester Co., N. Y., sent us specimens of the fruit of this variety, which seemed to be of excellent quality and early. Our own plants being too small to allow of a fair judgment, we requested Dr. H. to state how the Duchess had done with him. He replies:

"It has for three years ripened earlier than any other of over one hundred kinds. Its berries are larger than those of other very early varieties, hold out well in size, and are of uniform globular shape, without neck; color, light crimson; flavor, good and sprightly, without being acid like the Wilson; texture, firm. Berries sent to Virginia, arrived there in good condition, three days after being picked. Foliage hardy and vigorous, withstanding the severe drouth of last year exceedingly well.

This variety has not yet been disseminated, but will, if it succeeds in other localities as well as in the vicinity of New York, form a most valuable addition to the list of early strawberries."

As Dr. H. has a soil quite different from ours, we requested he would state how some of the newer sorts have done with him, and he adds the following notes:

MONARCH OF THE WEST.—A large, irregular globular berry, of dark crimson color, fair flavor, and moderate firmness. On our soil, a light clay, it is not productive enough to be profitable.

CHAMPION.—Reports from many localities show that this variety is not excelled in size and productiveness. Its quality is rather indifferent, and it lacks the firmness necessary to withstand long carriage, but for local markets it will, no doubt, be much sought for. [Quite worthless on our light soil.—ED.]

BLACK DEFIANCE.—Continues to gain many friends. It seems well adapted for many varying localities and soils, and its large size, excellent flavor, and great productiveness, make it one of the most valuable varieties for the family garden.

DR. WARDER did not bring to the East its good qualities, which gained for it at the West the silver cup of the Cincinnati Hort. Society.

Our experience with these two last named varieties is the same as that of Dr. Hexamer.

Preserving Flowers—Winter Bouquets.

Those flowers known as "everlasting," of which the Helichrysums and Rhodanthes are examples, have petals of a papery texture, and when these are cut early and dried properly, they form pleasing winter bouquets. So grasses, both cultivated and wild, if dried in the shade and made up in a tasteful manner, form acceptable room decorations, as do dried ferns and skeletonized leaves. Within a few years baskets, bouquets, and floral designs, have been imported in considerable quantities, and though these are largely made up of everlasting flowers, yet they contain other flowers of their natural colors. So also large bunches and bouquets of grasses, dyed of all sorts of unnatural colors, even to black, are offered by the dealers. There is no subject upon which we have had more frequent inquiries, than upon the preservation of flowers, and especially the coloring and crystallizing of grasses. While some of these winter ornaments are pretty and tasteful enough, to our notion there is nothing more unnatural than grasses colored of all the hues in the rainbow, and some that are not there, or loaded down with alum crystals—but as many do like these things, we propose to tell them how they are done. Of course those who, in this country or abroad, make a business of preparing dried flowers, grasses, and the like, for the market, are disposed to keep the processes as secret as possible, and but little has heretofore been published about it. Within the past year there have been articles in the European journals, especially in the Garden, giving useful information; we were about to experiment upon the methods given in the foreign journals, when Mr. J. Peterson, of Chicago, Ill., sent us a manuscript upon the subject, which he wished us to publish in a book-form. As we did not think there was sufficient material to warrant making a book, we purchased the manu-

script of the author, to use in the *Agriculturist*, or in such manner as we chose. What we may publish upon these matters are with Mr. Peterson's articles as a basis, to which will be added such information as can be gathered from other sources, as well as the results of our own experiments. The two leading methods of treating flowers (excepting the so called everlasting), to dry them in their natural form and colors, is by the use of sulphurous acid, and by drying in sand. As the last named method is a very old one, and is likely to be more generally known than the other, we give the sulphur process first. When sulphur is burned, the well known suffocating fumes of sulphurous acid (SO_2) are produced; the bleaching properties of this are well known, it being used for whitening straw, and other materials; it also has the property of preventing the decay of vegetable substances, and it has been found that certain flowers, after they have been thoroughly exposed to the sulphur fumes, will dry and preserve their proper forms, and though the action of the sulphur destroys their colors, these will be after awhile for the most part regained. The apparatus required for this operation is very simple—a tight box, with an arrangement for suspending the flowers, and a vessel to hold a few coals upon which the sulphur is burned. Any box, if sufficiently large and tight, will answer. One about three feet each way is best for large operations, but one only two feet square will answer. If not tight, the box must be made so by pasting paper over every crack and opening, as the success of the operation depends upon confining the sulphur fumes as closely as possible. The whole top of the box may open, in which case it may be necessary to place a damp cloth

between the edges of the box and the lid, and weight the lid down with stones to make a close joint. Cleats are nailed to the inside of the box, an inch or two below the edge, upon which rest the ends of light sticks, upon which to hang the flowers. The flowers are tied together in bunches of two to four, according to their size; then each two bunches are tied together in such a manner that they can be hung upon the cross-sticks. Having prepared the flowers, and placed them on the sticks, they are ready for the sulphur. Any old iron vessel will answer for a fire-pan, or a flower-pot, with its hole plugged up, and half or more filled with ashes, will answer as well as anything. Put some live charcoal in the fire-pan, set it in the box, and drop upon it some lumps of roll-sulphur. An ounce, or a little more, is suf-

ficient. As soon as the sulphur is on fire, the box must be closed. If the box is perfectly tight, the oxygen of the air will be all consumed, and combustion checked, before a sufficient quantity of sulphur-fumes have been formed; to guard against this, an inch-hole is to be bored in the box near the bottom, and another in the top; these are to have corks fitted into them, by which they can be closed at will. After the box is shut, these holes are left open eight or ten minutes, by which time the box will be well filled, and the corks may be put in place. The box, thus closed, is allowed to stand for twenty-four hours. When opened, the flowers will be found to be bleached and white; they are then taken out, and hung up in a dry, shaded, well ventilated room. The flowers thus prepared are said to keep for any

We may state here, with reference to everlasting flowers, that they should be cut before they fully expand, and tied in bunches not large enough to crowd one another out of shape, and be hung, head downward, in an airy room to dry. The methods of coloring these will be given later.

The grasses can be dried as they come into perfection during the season, as they are always dried preparatory to coloring and crystallizing. Many of our native grasses are well worth looking after.

The Manihot Hibiscus.

There is found along the banks of the Mississippi, and other Southern localities, a fine

large flowered Hibiscus, which was at one time supposed to be a native, but is now regarded as an introduced plant, the *Hibiscus Manihot*. The plant is a native of the East Indies, and has long been cultivated in Europe as a greenhouse perennial. The stems are four feet or more high; the leaves five to seven-parted with long and narrow divisions, which are sometimes nearly a foot in length. The flower is similar in structure to that of the Hollyhock and others of the Mallow Family, and is six inches or more across; the petals are of a fine canary-yellow color, each with a dark brownish purple spot at the base, which forms a fine contrast with the yellow, and makes the flower quite showy. Like many other perennials, this will, if the seeds are sown early, bloom the first year, and it may be treated like an annual, or the roots may be taken up in the fall, and kept over winter in the cellar, if not wanted to bloom in the greenhouse. Of course it is hardy in the

warmer States. We had long known this plant from herbarium specimens, and were much pleased to receive last year some seeds from Peter Henderson & Co., from which we raised plants which flowered abundantly the same season. The engraving shows the flower and leaf, much reduced in size.

THE JAPANESE PRIMROSE.—Some of our florist friends think that in our article in June, we did not give the Japanese Primrose, *Primula Japonica*, all the credit to which it is entitled, while others have called to say that they were glad to see the article, as it was entirely just. We have nothing against the Primrose, but we have a strong objection to the European custom of over praising every new plant.

THE MANIHOT HIBISCUS.—(*Hibiscus Manihot*.)

length of time, provided the air is dry; hence in damp weather the room where they are hung must be closed. When the flowers are removed from the box, they resume their proper colors, some in a few hours, and others require several days. The treatment to make up flowers preserved by the sulphur-process, will be given at another time. The following flowers have been found suited to this process: China Asters; Larkspurs, especially the dark-blue ones; Fuchsias, the well-developed buds making better specimens than the open flowers; Roses, the double, well-filled sorts, except white; Goldenrods, all the yellow ones; Spiraeas, all the red flowering ones; the white *Xeranthemum annuum*, which, though an everlasting, does not dry pure white, unless treated with sulphur. This list will, no doubt, be considerably enlarged.

THE HOUSEHOLD.

(For other Household Items, see "Basket" pages).

Comfortable Country Chairs.

How rarely does one find really comfortable chairs anywhere? People seem to buy the style of furniture in fashion at the time, and this is usually made with a greater regard to show, than to comfort. In the country, where hard working men and women need easy and restful seats, there seems to be a great lack of them. The best room may have some hair-covered or rep-covered rocking or

EASY-CHAIR.

lounging chairs, but these are too good for daily use, by tired people in their working clothes, and as for taking the best furniture out of doors, that is not to be thought of. We Americans, especially those of us who live in the country, make but very little use of our spacious summer parlor—"all out doors"—A wide spreading tree, a vine covered arbor, a broad veranda or porch, an awning like a huge umbrella, or a tent with no sides or even an open shed is a much more com-

ROCKING-CHAIR.

fortable place for sewing, reading, and resting, than any place in-doors, and often comes handy for ironing and other work. For the enjoyment of the open air in any case, seats and chairs that are not too good for rough usage or too rough for ease are needed. The good old-fashioned framed chairs, with split-wood or flaggged seats, have long been

discarded for the glued work of the modern cabinet maker, but we are glad to see them coming into use again; they were formerly the regular furniture of the farm house; now they are offered as luxuries at the fashionable furnishing stores, and are purchased by those city persons who go into the country for the summer, and wish to take some strong comfortable chairs with them, as they are quite sure to find no such thing at a country hotel or farm boarding house. We give drawings of two of these, which will, no doubt, be new to young housekeepers, but there are, we are sure, many old ones who can remember when such chairs as these were good enough for the best. Within the half century there has been wonderful improvement in household conveniences, but it does not lie in the direction of furniture for daily use.

Some of the "rustic" furniture on sale is very pretty to look at, but one would find it anything but pleasant to sit in for long at a time.

pudding—Sponge Cake—Catsup.

The housekeepers of our circle are certainly very ready to assist one another; we do not know that we have asked for aid in any case, that the replies were not abundant and prompt. In June last, we published a request evidently from a young housekeeper, whose statement that she had tried "and failed to suit George" seemed to be so wifely, that her note was given just as she wrote it. The appeal has brought out so many replies, that we despair of ever publishing all. The one now given is from Mrs. "M. A. D." St. Paul, Minn., and we may print others; she says:

First, the lady wishes a nice, light, boiled pudding, that will please "George." My husband, who is not very fond of puddings in general, likes both of the following:

POOR MAN'S PUDDING.—One cup of syrup; and if desired, one or two spoonfuls of sugar; half cup of butter; one cup of sweet milk; one cup of raisins; one pt. of flour; one or two eggs; one tea-spoonful of cream-of-tartar; half tea-spoon of soda; a little salt. Put in a pudding dish and bake or steam. To be eaten with liquid sauce.

STET PUDDING.—One cup of suet; one cup of molasses; one cup of raisins; one cup of milk; three cups of flour, or one and a half cup of cornmeal, and one cup of flour; one tea-spoonful of soda. Stir molasses and milk together, put in soda, then suet, then flour slowly, then raisins. Steam three hours in pudding dish. Eat with sauce.

SPONGE CAKE.—The following recipe for sponge cake, I know to be excellent. Ten eggs; the same weight of sugar, and one half the weight of flour. The grated rind and juice of one lemon. Beat yolks and sugar to a cream; then stir in gradually and very gently the flour, and the whites of the eggs well beaten; add lemon. Watch while baking.

TOMATO CATSUP.—To one peck of ripe tomatoes, add one tea-cup of salt; three table-spoonfuls of black pepper; two do. cloves; two do. allspice; one large red pepper, fresh from the garden; four large onions, chopped fine; one tea-cup of brown sugar; one quart of good vinegar. Pour boiling water on the tomatoes to remove the skins, then cut up in pieces or mash in your fingers, add the above ingredients, and boil two hours in a large porcelain kettle. Add a tea-cup of celery seed, if liked, and then mash it through a common colander. Put on the fire again, and let it come to a boil, then bottle while hot, and seal the bottles, although it will keep a long while only corked, without being sealed. Dry all that will not pass through the colander for soup in the winter; but mash all through that will go, as it makes the catsup richer and thicker. The above catsup I know will keep a year, and I have no doubt, would keep two or three years, as mine is just as good now as it was when I put it up last summer, and many of the bottles were merely corked. I boiled it longer than two hours, making it very dark, and when put through the colander, so thick and almost jelly-like that it has to be shaken out of the bottles.

Home Topics.

BY FAITH ROCHESTER.

BERRYING.—Have you noticed the difference in children, with respect to their berry-picking ability? Some never have any "luck," you know; while other children, who go in the same party, bring home a fine lot of berries. I could not understand it when I was a child, but I am now able to explain the case to my little berry-pickers, and their "luck" is better than mine used to be.

Children should be taught to regard berry-picking as a business, while they are engaged in it, and nothing should divert them from it till the business is done. If they go into the woods and fields, a thousand beautiful and wonderful things may attract their attention, and I can not say that these wonderful things are of less importance to them than berries. One thing at a time, however.

Teach them that it is not best to wait until they find the berries "thick," before they begin to gather them. They should pick every good berry they find in their way, though there may not be more than a dozen on a bush, or even less. While the "lucky" berry-pickers are slowly, but surely filling up their baskets, the luckless ones go sauntering on, looking for some place where they can find the berries "as thick as spatters," stopping to gather winter-greens, or mosses, to put in their pails, because they begin to fancy that they can not find any berries, and they think they may as well carry home something. In the meantime, perhaps, they eat the straggling berries on the bushes they pass, thinking there are not enough to pay for putting them in the pail, and hoping to make it all up when they find the loaded bushes. A lesson here is very important, as it will apply to all the business of life.

If they have set out to pick berries, with a knowledge that the folks at home desire and need the fruit, their honor should hold them to the berry-gathering till the duty is done. In all these matters the conscience should be cultivated.

They ought to be taught, too, that it is *wrong* to eat between meals, that even a few berries taken when the stomach has the last meal only partially disposed of, or if taken when the stomach needs its regular rest, interferes with the health. If children begin to feed themselves when in the berry-field, it usually interferes seriously with the filling of their berry-baskets, and the best fruit is what they eat. They should set out with the determination not to eat a single berry till the regular eating time comes. I know that this can be done, for I have seen it. It is a good exercise in self-control, and all children could more easily accomplish it, if grown people were not so ignorant and so careless of all these laws of health in their own habits and consequent examples. Not long ago I saw one of the best of fathers, who had lately been sincerely rejoicing that his little children had learned not to eat between meals, come into their presence and eat an apple in the middle of the forenoon. It had not been easy for the mother to change her children's habits for the better, and they were evidently perplexed by their father's example, after all that had been said to them. This is one way of causing the "little ones to offend." This father had not learned to regard fruit as food.

What shall be done with the berries brought home? Could any but a heathen mother say to the children, who had conscientiously gathered the berries, "No, no! I want all of these berries for pies and for canning?" It is fair to give the children a generous share, and to give them while they are fresh. They will never be so delicious or so wholesome again. Ah! if the children could each have all they want of sweet new milk, with good bread and plenty of ripe berries in it! That is far better than sauce-dishes of heavily sugared berries.

Can all the berries you like, *after* you have supplied your family with fresh berries. It is not necessary to wait until the berry season is about over before canning, only do not rob the table of fresh berries in the berry season, in order to treat company with canned or preserved berries in the win-

ter. Fresh berries are very wholesome food, if eaten simply dressed, with nice sugar, or cream, or in milk, at the regular meals.

THAT FRYING-PAN.—And now the doctors are after us—us farmers' wives. The doctors of Massachusetts say, by way of the State Board of Health Report for 1874, that one of the most crying sins against hygiene in farmers' families is *too much frying of food*. Food which would be good and wholesome boiled or baked, is often made as indigestible by its contact and admixture with melted fat, or butter, as to be almost ruined for all purposes of nutrition. Those who take a good deal of out-door exercise, can stand this abuse of their stomachs much longer than others can, whose work is in the house, or who work chiefly with their brains. "The most indigestible of all kinds of food are fatty and oily substances, if heated. It is on this account that pie-crust and articles boiled or fried in fat, or butter, are deemed not as healthful as other food."

Really, I can not think of a single article of food that must be fried. I know of nothing which can not be made quite as palatable, or more so, when cooked by some other method. All kinds of meats are better broiled, or boiled, or baked, or roasted. It is so with every kind of fish that I know of. Vegetables of all kinds may be boiled, or baked, or steamed; and, certainly, the poorest way to deal with fruit is to fry it. [It may be new to some of our readers that apples, fried in pork fat, are quite a favorite dish with many.—Ed.] No kind of grain can be made up so nicely, or healthfully, by means of the frying-pan, as by use of the oven, or steamer.

To warm over cold potatoes, make them into potato balls, seasoned with cream, and brown them on a baking tin in the oven; or wash them with a fork or potato-masher with cream or milk and salt, in a spider, and warm them on the top of the stove.

If you have cold mush on hand, the easiest thing is to eat it cold, with milk or with cream. Or you can heat it thoroughly in the oven. Or you can make it into nice mush-balls—oat-meal, corn-meal, graham, rye—by mixing the mush stiff with white flour, and baking in balls. It is not necessary to fry cold food in order to warm it over; but if it seems most convenient or desirable, it may be heated upon a griddle, or even in a flat-bottomed frying-pan, with only enough butter to keep the food from sticking when it is laid cold upon the hot iron. This can hardly be called frying, and does not fill the room with the odor of scorched grease.

Aside from the unhealthfulness of fried food, we should banish the frying-pan, if possible, on account of the contamination from this source of the air of our rooms. [Of course we allow Mrs. Rochester to express her views on this matter, and we agree with her that it is better to abolish the frying-pan altogether, than to have so much good food spoiled. But there is proper and improper frying, and when certain things are properly fried, they are quite free from grease. Smelts, properly fried, may be served on a napkin without soiling it; the celebrated Saratoga fried potatoes are put up like bonbons without a hint of greasing the paper, and a veal cutlet, or lamb chop, properly covered with eggs and crumbs, may be fried in an unobjectionable manner. The trouble is that many sizzle things in fat, and think they are fried.—Ed.]

SMALL WAISTS.—We are all finding out, gradually, that deformity and beauty never coincide. As we learn more about nature and her laws, our childish self-conceit in respect to our superior taste, gives way before a growing admiration of the beauty of use and fitness in all that God has made. Who that knows how wonderfully the heart and lungs perform their work—yes, and the stomach and liver too!—when these organs have the necessary room and building materials, can even look upon a wasp-shaped female figure without horror. I can not possibly admire such evidence of a slow murder taking place before my eyes. I can not help thinking of the cramped organs, and of the blood which can not speed upon its life-giving errands through a body so pinched and pressed, blood which has

little life to give, so badly is it fed by food which never is well digested in a stomach cramped for room, and so poorly is it supplied with oxygen in the oppressed, poorly-working lungs.

Do study physiology, my silly friend, and pray to the Lord to convert you to some religion, which will make you mindful of His laws written upon His works, and reverent in your treatment of the "living temple" for His spirit, which is the human form.

You think I do not mean you? I do mean you! I mean, at least, nine women out of every ten. For, though tight-lacing is said to be out of fashion, I am convinced that very few women wear their clothing loose enough about the waist. Sometimes it is only the belt that is drawn too tight, but that can never be done with impunity.

"But my girls have naturally small waists," says a fond mamma, whose ignorance leads her to admire the round, tapering waists of her daughters. I have heard often of "naturally small" waists, even from girls who were in torture while they spoke. Nature never makes such waists. The pinching may have begun so early—even in babyhood—that no one has ever seen any particular change. The bands were pinned so tight that the floating ribs have never had a fair chance to spread as the body grew, and the young girl, liking the smooth fit of her dresses as she grew older, has always worn her garments snugly fitting, though she may not have worn corsets at all. These are your "naturally small waists"; and these are your girls who die early of consumption, or live lives of debility and dependence upon a doctor's care.

It is so very uncommon to find a woman who will confess that her corset is drawn too tight, that many believe no such person exists. There are girls, however, who acknowledge that their clothing is tight; but they "like to feel it snug." They can't bear to feel as though they are "all dropping to pieces," as they say. They have learned to depend upon the support given by the bones and springs of the corset, and their own muscles have little strength and elasticity. It sometimes happens that a woman who asserts that her corsets are not worn tight, has to go without that part of her clothing for a little time, while mending or cleaning the corset. Then, if she undertakes any very active exercise with her arms, you are almost sure to see her dress-waist bursting at the seams or hooks, or button-holes—proof positive that the corset was tight.

BREAD CRACKERS.—I have asked "grandma" to tell me just how she makes the nice little bread crackers, which my children and their mother like so much. She says she has no particular recipe for them, but as near as she can tell they are made as follows: Take about a quart of the light bread dough, when you make it into loaves (it having been previously kneaded and allowed to rise again), work into this a piece of butter about the size of a butternut, or a small hen's egg, in the same way that you would work butter into bread dough to make biscuit. Roll the dough to the thickness of about three-quarters of an inch, or less than an inch in thickness. Cut it into shapes with a small biscuit cutter (or empty spec-box!). Let these biscuits rise till very light, but never until they begin to sour, and then put them in your hot oven, and bake them. When they have partially cooled, break them apart (or separate them from each other), stand them upon their edges in a baking tin, and set them back in the warm oven, or in a tin warming-closet, to dry thoroughly.

These are better for the children than bread and butter, though not suitable alone for a whole meal. They are nice to eat with juicy fruits, or with soups, and are good in milk. They are more wholesome than the sale crackers, which have more or less lard in their composition, whatever be their name or shape.

APPLE PIES FOR LUNCHES.—Try this. I have tried it with success, and I have found no hungry person who did not praise the little pies. You can see for yourself when you read the recipe, that they can not come under the censure which intelligent people bestow upon ordinary pie. They seem

ridiculously simple, but if well mixed and thoroughly baked, they are delicious. Take good juicy dried apple-sauce—but first about the cooking of that sauce. Either soak the dried apples over night, and then cook them slowly in the same water next morning, or let them heat up slowly upon the back of the stove, with plenty of water to soak them out fully, and keep them from burning while cooking, and add the necessary sugar while the fruit is still boiling. Let the sauce be thoroughly soft, or well done. Then stir into a pint, or any quantity of it, enough graham flour to make a rather stiff batter. Dip a spoonful of this into dry graham flour, and, taking it into your floury hands, mold it into a round flattish biscuit. Fill your baking tins with these, and put them into a hot oven. Bake them thoroughly—upon the clean oven grate, if you prefer it to the tins. The process of molding the pies suggests the proper stiffness of the dough, but do not get it too stiff—that would make the pies (or apple-cakes?) too hard.

Any other sauce can be used in the same way—fresh apples stewed, stewed peaches, stewed prunes, huckleberries,—anything that is simple and juicy. Let the baking be done in a hot oven, and thoroughly done without burning. Let the children have these to carry to school for the noon lunch. The graham flour gives the proper nourishment for their bodies, and the apple makes it more palatable, and is in the most convenient shape for their use, unless they can have raw apples and graham crackers.

A Mother on Bathing

BY MRS. J. C. B.

It seems strange and unaccountable that so many of the really intelligent class act as if in ignorance of the necessity and benefit of bathing. It seems almost incredible, but there are many ladies most particular as to dress and fashion, who almost wholly neglect this matter. Some mothers think when their children get beyond two or three years of age, the frequent entire bath can be dispensed with. If some of the main facts of physiology were well known and understood, every one would perceive that cleanliness of the skin, is one of the conditions of good health.

We learn that the skin has innumerable minute perspiration tubes, opening upon the cuticle, and these openings are called pores. These tubes are hollow, like a pipe-stem, lined with wonderfully minute capillaries, which are constantly exhaling the noxious and decayed particles of the body, just as the lungs pour them out through the mouth and nose. It seems clear that injury, more or less, must ensue if this drainage from the body becomes obstructed. It happens when bathing is disregarded, that the lungs, kidneys or bowels, have more than their own apportionment of work. If these are strong and healthy, they may bear the tax with little apparent injury, but in most cases a lowering of the vitality and tone of the system ensues.

Large bath-tubs are pleasant and convenient, but not indispensable to the proper cleansing of the skin. A speedy sponging of the body in pure water, followed by friction in pure air is all that is necessary. When disinclined to use water, I find a thorough application of the flesh-brush to the whole person, an admirable substitute; especially on retiring, it relieves nervousness, equalizes the circulation, and induces quiet sleep. Mothers, above all, should see that their children are well bathed. If their skins are kept active and healthy, there will not be half the danger, from fever, colds, and eruptive diseases. If your little one is cross or troublesome, and finds no occupation that pleases him, try the effect of a bath, sometimes it is magical, and if tired, he will go to sleep and awaken bright, cheerful, and happy.

Do not though, as I have seen some parents do, plunge a child into cold water when he screams and shrinks from it, thinking you are doing a good deed. Nature must be the guide, if your child has a nervous constitution, a shock of this kind is only exhausting and injurious.

BOYS & GIRLS' COLUMNS.

A Pigeon-House for Boys.

Boys who wish to keep pigeons where there is no barn or other building in the loft of which they can make a pigeon-house, often put up boxes and coops in the yard and along the fences. These are generally unsightly, and are moreover exposed to the attacks of cats, which are fond of fat squabs. A friend who had to put up an independent pigeon-house sends us drawings of it. This house stands upon a very firm post, which should be high enough to place it out of the reach of meddlers. The manner in which it is arranged will be understood from the drawings and his description, which is as follows:

A pigeon house that may be made safe from the depredations of cats, or owls, and all other enemies, is shown in figure 1. It is elevated upon a post set firmly in the ground, and not less than 10 feet high. Cross-bars are fastened to the post, as shown at fig. 2, for the frame of the house. The frame is made of light half-inch clap-boards. The bottom is boarded in, and the nest-boxes are placed upon it. In the figure the alighting-board is seen at *a*, the nests at *b*, and that portion of the bottom,

Fig. 1.—ELEVATED PIGEON-HOUSE.

at *c*, is fastened with hinges, or strips of leather, so that the separate pieces will fall down, when not held in place by buttons. Above the nests a sloping roof is made, and above that, on a level with the upper row of holes, the upper cross-bars of the frame, of which three form the roosts. The droppings fall upon the sloping roof of the nests, and slide into the central part, and gather upon the bottom boards, *c, c*. These are cleared by turning the button which holds them, when they drop down and discharge themselves of the manure. This is very valuable, and should be preserved for use. The size of the house may be 6 feet wide and 4½ feet high, from the floor to the eaves. Each of the three cross-bars is thus 6 feet long, and each face of the house is three feet wide. There are three nests in each face, or eighteen in all, but this number may be

Fig. 2. SECTION OF HOUSE.

doubled by making two tiers of nests. The alighting-boards are raised up by cords, which pass over pulleys at the eaves, and may thus be closed at night to keep out owls. The post should be planted firmly enough to permit a ladder to be rested against the house, to enable the nests to be cleaned out occasionally.

A Child's Pun.—Do you know what a pun is? It is rather difficult to describe, but perhaps the shortest way is to say that it is a play upon words, in which a word with the same sound is used in place of another of a different meaning. Thus, when the young lady said to Douglas Jerrold, "I am very sad, you see,"

and he replied, "No, you are very fair, I see," he not only made a pun himself on *Pharisee*, but turned her remark into one on *Sadducee*. This is a very complete pun. We heard the other day of nearly as good a pun from a little girl. She said to her mother, "I wish my doll was realized." "What do you mean, my child?" asked the astonished mother. "She's got glass eyes now, and I wish her to have real eyes." That little thing made a better pun than some do who try to be funny.

Aunt Sue's Chats.

Mrs. S. G. M. thanks me for furnishing the children with so much amusement, but she has to "help them" with the puzzles, etc., etc., and adds, "they are restless children, and sometimes when I am busy sewing, I don't know how to keep them quiet."

Under such circumstances I have amused children for a long time with the rhyming game. I will illustrate it, although, I dare say, it is familiar to many of you.

I.—Jimmy, I have a bright thought, and it rhymes with "lip."

Jim.—Is it what you do from a cup?

I.—'Tis not to "sip."

Mary.—Is it what you do on the ice?

I.—'Tis not to "slip."

Jim.—Is it what you do with the scissors?

I.—'Tis not to "rip."

Jim.—Oh! Aunt Sue missed it; I didn't mean "rip."

I.—'Tis not to "snip."

Mary.—Is it what little lambs do?

I.—It is to "skip." Now it's Mary's turn, as she guessed it.

Then Mary has a "bright thought," which rhymes with "sky." After trying fly, shy, ery, my, pie, sly, rye, etc., Jimmy says, "Is it what a pig lives in?" "Yes, it's a sty."

This, you see, sets both parties guessing, and is a pretty good amusement for a rainy day. Try it, Mrs. M., and let me know how it works.

NELLIE A. W. says, she has read lately that there never was such a person as William Tell, and the story about shooting the apple from his son's head is all a fable. Nellie feels sorry to have to give up her hero. Well Nellie, *don't* give him up: his story is often told in very old German songs, and two chapels were erected centuries ago in memory of his exploits. If they believed in him, I don't know what right any one in the nineteenth century has to doubt his existence. I always liked Tell, but I consider the lad the "hero."

MINNIE F. G.—Yes indeed, Barnum's Hippodrome is well "worth seeing;" another month I may "tell" you "all about it."

CHARLEY EAMES.—Gold-fish were originally natives of China; silver-fish, though somewhat different in color, are the same species. They were introduced into France in the time of Madame Pompadour, some of them being sent to her for a present. In Portugal they are so abundant, that they are fried and eaten quite commonly. I don't know who imported them to Brooklyn, but the boys catch them here in the ponds. Do not fill your globe more than three-fourths full of water; do not place it in the sun, nor near the fire. Change the water every day. Some never give the fish any food, thinking that they get enough nutriment from the animalculæ contained in the water, while others feed them occasionally with little pellets of bread. A niece of mine had half a dozen gold-fish in a globe, which she tended very assiduously, occasionally dropping a bread-crumm into the globe, or a fly, and—it may be as a consequence—the fish died one by one, until only one little fish was left. Then said Lottie to me: "Auntie, this fish looks lonesome, shan't I take it over to Mrs. Prince's, and put it into her aquarium?" "Yes, dear, suppose you do." She did; and when she returned, I asked her, if the other fish gave him a hospitable reception. "Oh! very," she replied, they took him in, and did for him; one big fellow opened his mouth, and swallowed my little fish whole." "Why, Lottie!" "He did, Auntie! I was sorry for my poor little fellow, but I couldn't help laughing to see him so thoroughly taken in."

Moral.—Better be lonely than swallowed.

M. L. E.—I don't know much about the stings of bees, but if I should be stung by one out in the field or garden, I should immediately pull out the sting, if the insect had left it in my keeping, and apply a little poultice of mud. A few days ago I placed my hand on a wooden railing, but thinking I had set my finger on a red-hot needle, I took it up a great deal quicker than I had put it down, and, lo! there was a hornet walking sulkily away. Then I knew I had been stung, and went down stairs to bewail my fate among my friends, (it is so disagreeable to not have plenty of people about to witness one's sufferings!) One good Samaritan immediately went for some cooking soda, put a little of it on a strip of rag, moistened it, and applied it to my injured digit; it relieved the pain immediately. Alkalies, such as Soda or Ammonia (Hart-

shorn), if quickly applied, appear to have the power to neutralize the poison of these stings.

Now I must express my thanks for puzzles, letters, etc., to Giles F., P. A. McI., Tot, Mary J., H. Beuson, Miles S. W., and Jerry.

What Six Pecks of Potatoes Did.

It is not every farmer who reads an agricultural paper at all, fewer still read more than one, and it is very rare, indeed, that one of our farmers wishes to know what his brethren in other countries are doing. Some time ago a farmer in Pennsylvania wrote us to know about the best paper in England, as he thought he could learn something useful from it; at the same time he gave a brief story of his life, which he did not intend for publication, but thinking it would be of interest to farmers' boys, we asked permission to publish it. He replied: "You are at perfect liberty to use my letter as you see fit; if it encourages but one boy, it will be so much good accomplished." So we let him tell his own story:

"When I was a boy of about fourteen, the hogs broke into our garden when the ground was wet, and rooted up one corner to such an extent, that the soil, being naturally clayey, baked as hard as a brick-bat. The next spring, when my father came to spade the garden, he found this clay corner so hard and full of clods, that he abandoned it, and told me I might take it and do with it as I pleased. As I had often longed for a plot of ground of my own, I jumped at the chance. I set to work at once with a grubbing hoe (for it was too hard to spade), and brought it to as fine a condition as I could. Then I applied some manure and ashes, and planted it with potatoes. The plot was a small one, not more than about 6x12 feet, but I raised a bushel and a half of potatoes, which I sold for fifty cents per bushel, making 75 cents. This sum, with five cents obtained in some other way, was paid to a neighbor, who was raising a club for the *American Agriculturist*; the subscription was \$1 a year, and 80 cents in clubs of ten at that time, when the paper was much smaller than at present. I had a great thirst for agricultural knowledge, and have yet. I have taken the paper ever since, subscribing last New Year's for the eleventh time. The money for the paper was obtained the first three years from the plot of ground above alluded to, which, by the teachings of the paper, I brought to a very high state of cultivation. I afterwards got to farming my father's farm on shares, and this I followed up, until in my twenty-fourth year I married, and afterwards bought the farm. I think the paper has been getting better every year since. I commenced to take it so young, and have taken it so long, that I have learned to love it and its editors. I am putting its teachings into practice as fast as my means will admit. They enabled us last summer to get forty cents per pound for all the butter we made, while the general market price was, through June and July, but fifteen cents, but ours was good butter, and no mistake."

As the rest of the letter is about his plan for improving his stock, it will hardly interest boys. Now let every boy, who thinks there is no chance for him to ever be anything on the farm, but he must go off to the cities, which he mistakenly thinks are full of opportunities, just read this story of Miles Wall and take courage. He began with six pecks of potatoes, and a determination not only to be a farmer, but a good farmer. He found out how good farmers managed by reading the papers, and now by using his brains as well as his hands, he is in a position to talk about improved cattle and other improvements. We thank him on behalf of the boys for telling them this lesson.

SQUARE WORDS.

- 1.—1. A house. 2. Place of contest. 3. At no time.
- 4. Active. 5. Soon.

- 2.—1. Smallest. 2. Older. 3. Farewell. 4. Appears.
- 5. Confidence.

THE LITTLE FOLKS.

TRANSPOSITIONS.

1. Transpose a heavenly messenger, and leave a place where two points meet; again, to collect things thinly scattered.

2. Transpose a descendent of the fallen angels, and leave the support of an arch; again, meaning fully mature.

3. Transpose a fiery heavenly body, and leave far off.

THE NEW COMERS IN THE POULTRY-YARD. — Drawn and Engraved for the American Agriculturist.

- 4. A country in Palestine, and leave a cupola; again, the prevailing fashion.
- 5. Transpose to gaze earnestly, into weeds; again, to prices paid; again, to drops of moisture.
- 6. Transpose a luminous heavenly body into animals; again, into sailors; again, into the plural of cunning dexterity.

M. P.

CHANGED HEADS.

Should we the whole world travel o'er,
From China's wall to England's shore,
Among them all no place we'd find,
To equal this that's in my mind.

Cut off my head, and in its place,
Another plainly shows its face;
Raising me high on stately walls,
Within whose sides lie sacred halls.

Another change—cut off my head
Again, and in its stead
A caput strange securely hold:
A foreign city I unfold.

HENRY.

CROSS-WORD.

My first is in rafter but not in beam,
My next is in slumber but not in dream,
My third is in flower but not in pink,
My fourth is in paper but not in ink,
My fifth is in wisdom but not in sense,
My sixth is in dollar but not in pence,
My seventh is in dahlia but not in rose,
My whole is a place where the orange-tree grows.

ANAGRAMS.

- 1. O buru dim.
- 2. Hurt a leg.

The New Comers.

When new scholars enter a school, the first day is a very awkward one for them, as the old scholars often behave in a very rude manner. The new comers feel ill enough at ease, from being in a strange place, and it hardly makes them feel more comfortable, to have all the old scholars stare at them and exchange looks, if not whispers, that evidently concern them. In the picture the new comers evidently feel in a quite different mood from the new scholars, and they show no signs whatever of being bashful, or of being annoyed at the staring. The strangers are some newly imported French fowls, which are distinguished by a very curious comb, this, instead of being like that of common fowls, is in two parts, which stand up, one upon each side of the head, like two horns, and presents such an odd appearance, that we do not wonder that the rest of the inhabitants in the barn-yard stare at the strangers. The old gobbler evidently does not mean to be astonished by any new fashions, but spreads his tail, swells up his wattles, and gets very red in the face; the other birds are not to be behind, and one and all put on their best looks: nor are the new comers afraid to be looked at, they stand out in full view, and look back again with a hearty good stare. We suppose this is the way these birds have of making an acquaintance, they do not have any one to formally introduce them, but they stare at one another until all hands are tired. It may be that the old rooster, who has been at the head of the barn-yard for a long time, will not be satisfied until he has a tussel with the new comer, to see who shall be master, but after a few days they will all get along without any trouble, and peck away at their corn in the quietest manner

Life Insurance.

It is good policy to have a good policy. To assure oneself that the assurance effected is effective, and will eventually be a pillar of strength and comfort to those in whose favor it is originated, is very nearly, if not quite, all the modern duty of men. And yet many a man jogs along through life vainly dreaming that it will last forever—forever being an indefinite idea of robust health. His glass shall discover to him the approaching wrinkle, and the inevitable thread of silver among the well-oiled curls. But with the vanity of self-appreciation, he flies to the cosmological mysteries to hide the advances of time; the inexorable apathy will overcome him, and he shall neither have policy nor prudence. "By-and-by," says he, "I will insure." By-and-by comes, and the sum which would otherwise have secured his family a competency, has been spent in the adornment of his favorite moustache, and the quiet little suppers after the theatres. In the course of the year, this will come to a total, double and treble his premium, and the physicians shall absorb the rest. "By-and-by" has made him uninsurable. "To-morrow," and "to-morrow" arrives, until there is no to-morrow, and the greatest inconvenience of all arrives, the inconvenience which settles all claims, policies and premiums, proving there are people who think less of their lives than other men do of their property.

We can pull down barns and build greater; the household gods can be replaced again and again; nothing that is of the earth or the waters under the earth but what can be fished up if lost. But life we can neither build nor make; we can pull it down, annihilate it, or gradually dissipate it; but to replace it is beyond the power of man. The sting of non-existence, while existing, is robbed of half its misery; the mind relieved of a dull, heavy weight, a man lives longer and easier, when his life is assured. This is the best policy of assurance to assure.

The United States Life Insurance Company of this city secures its policies by an exceptional integrity and carefulness of management; by its quarter-of-a-century record without blemish; by its vast accumulations; its moderate expenditures and its wholesome growth. Insure in it.

The Agricultural College of Cornell University.

This Institution is now fully organized with the following Professors and Instructors:

- J. P. Roberts, Practical and Experimental Agriculture.**
- John Stanton Gould, Lecturer on Mechanics applied to Agriculture.**
- A. N. Prentiss, Botany and Horticulture.**
- James Law, Veterinary Science and Practice.**
- G. C. Caldwell, Agricultural Chemistry.**
- J. H. Comstock, Agricultural Entomology.**
- C. Fred. Hart, General and Agricultural Geology.**
- E. H. Fuertes, Surveying.**
- C. Babcock, Architecture.**
- J. L. Morris, Mechanical Engineering.**
- J. E. Sweet, Practical Mechanic and Superintendent of Machine Shops.**
- E. C. Cleaves, Free-Hand Drawing and Mechanical Draughting.**

Besides these, other University Professors give full instruction in this Department in Mathematics, Modern Languages, Natural Philosophy, Human Physiology, History, and Political Economy.

The University Farm is now in condition to give useful illustration both as to processes and experiments. The University Library and Laboratories, and extensive illustrative collections of machinery, implements, models, apparatus, drawings, and specimens, are freely opened to students.

By a recent resolution of the Board of Trustees, all students in the Department of Agriculture are to be caucated **Free of any Charge for Tuition.**

And ample opportunity will be afforded to such students to pay for their room-rent in the University building by labor on the Farm, if they desire to do so.

The next entrance examinations will begin Sept. 8th. For Catalogue, giving full particulars, apply to **Prof. G. C. CALDWELL, Secretary of the Faculty.**

(CIRCULAR.)

Consumers' Importing Tea Co.,
No. 8 Church Street,
P. O. Box 5,509. New York City.

This is a combination of capitalists to supply the consumers of Teas throughout the United States on the mutual principle.

We have experienced agents in all the best districts of China and Japan to select Teas especially for our trade.

We expect every consumer of Teas to render us all the assistance they can in carrying out our enterprise, as we make a specialty of **SUPPLYING CONSUMERS ONLY** (and allow no middlemen to make any profit on our importations), which will enable us to supply them with Teas at prices lower than have ever been known, and of those fine qualities that seldom reach the interior, being sold only in the large cities and among the very wealthy.

Hoping the consumer will take an interest in our enterprise, and send at once for a circular with full explanations of how to proceed to obtain our goods, we remain,

Most respectfully yours,

Consumers' Importing Tea Co.,
No. 8 Church Street,
P. O. Box 5,509. New York City.

Entered, according to Act of Congress, in January, 1874, by the Consumers' Importing Tea Co., in the Office of the Librarian of Congress, Washington, D. C.

New York College of Veterinary Surgeons,
INCORPORATED 1857.

Lectures for 1874 will commence about the middle of October and continue until the last of February, 1875.
Fees: Matriculation, \$5; Faculty, \$120; Graduation, \$25; Dissecting, \$5; Address for Circulars,
A. F. LAUTARD, V.S., M.D., Sec'y.
205 Lexington Ave., New York.

Tongue-Lolling Bits.

We make Bits to prevent the above bad habit. \$2, \$3, or \$4, for cash with order, or C. O. D. Hand-forged Bits made in any style to order. Patentees of the **BALDWIN BIT**, for slide pullers and hard mouths. \$2, \$3, and \$4. Also agents for the **MARTIN BIT**. See adv. in "Trnf, Field, and Farm," and "Wilkes' Spirit of the Times."

P.S.—Being about to abandon the vegetable seed-growing department, and devote our entire attention to Flowers, we offer for sale about 400 hot-bed sashes, 3 1/2 x 7 feet, at \$2.50 each, delivered in Baltimore.

SUMMER FALLOW.

CARHART'S PATENT TWO-HORSE Pulverizing Cultivator.

As a Pulverizer, Weed, Quack, and Thistle Exterminator, it has no equal.

The extremely low Price of \$22.00 places it within the reach of all.

From the hundreds of testimonials received in its favor we submit the following:

{ Secretary's Office, Patrons of Husbandry, New York State Grange, Elmira, N. Y., June 4, 1874.

BRADLEY MFG Co., Syracuse, N. Y.

Gentlemen:—Three years ago I procured a Carhart Cultivator to use on a summer fallow, infested with Canada thistles—the soil a heavy clay. My original design was to kill the thistles by the slow process of repeated plowings, but I found the work of the cultivator so easy, rapid, and thorough, that I could dispense with the plow and secure the object in view. My success was complete, and the expense of the process was more than one-fourth of the estimated cost, if performed by the plow. Ever since that experiment I have used my cultivator in the various operations for which it is designed, and I am not less pleased with it to-day than I was by its first success. Every season it is kept busy spring and fall by my neighbors, who show thus a proper appreciation of a good implement—for I have plenty of poor ones, which they refuse to borrow. My observation of their work warrants me in saying the Carhart works just as well or porous, gravelly soil, as on my clay. Very Respectfully, W. A. ARMSTRONG, Sec'y N. Y. S. Grange. BELFAST, N. Y., May 2, 1874.

BRADLEY MFG Co.—The Carhart Patent Cultivator came all right, and after trying it I prefer it to the Wheel Cultivator I have formerly used, which cost \$10.00. I. B. FORD.

Send in your address, and we will mail you free one copy of the illustrated Agricultural Economist, giving a complete description of this popular implement, and what Farmers say about it in 1874.

BRADLEY MANUFACTURING CO., Syracuse, N. Y.

THE DRILL OF THE PERIOD.

The Superior Double Force-Feed GRAIN DRILL

Has met with unparalleled success during the past two
years, and now stands without a rival in the Grain Drill
family. It is the only Double Force-Feed Drill in
the world. Thousands of farmers who have bought and used
the "Superior," pronounce it *entirely unequalled* for per-
fection of work, ease of operating, grain saving, time sav-
ing, and money making. Don't fail to examine it and com-
pare it with other Drills before purchasing.

A Seissors Sharpener and other wares. Sample 25 cts. Cat-
alogue free. T. J. HASTINGS & CO., Worcester, Mass.

Steamed Food and Ruminations.—"T. W. C.," Melrose, Mass. If any person has hazarded the statement that cows do not chew the cud when they are fed upon steamed food, he is certainly much mistaken. There is nothing unnatural about the practice of feeding this food any more than in grinding the corn or oats instead of feeding it whole. It is simply making the food more easily eaten, more palatable, and more digestible. Each of these effects is an economy, and the only question to be considered by the farmer is the matter of convenience. The economy and propriety of cooked food is well settled.

A Question in Dairying.—"Inquirer," St. Charles Co., Mo. We should say that there is no question as to the profit of keeping cows for the dairy upon purchased feed when hay may be bought for \$5 to \$8 per ton, corn at 30 to 50 cents per bushel, and oats 20 to 25 cents, with milk at 2½ cents per quart at a creamery near by. Under such circumstances, with a run-down farm we should keep all the cows we could procure and find room for, selecting, of course, good milkers. A good milker should yield 1,800 to 2,000 quarts in the year and raise a calf. If there were only the manure pile and the calf for profit it would pay. Every possible arrangement should be made to save the manure, both liquid and solid, and if the funds are to be had it would be an economy to steam the food. Dairymen in both Eastern and Western States, where feed is worth much more than the above prices, are making money with milk at 2½ cents a quart.

A Harrowing Question.—"Inquirer," It is difficult to say when a perfect harrow will be invented, or when we shall have one that will meet every expectation. The uses of the harrow are constantly extending, and every new use to which we apply it brings to light some new improvement. We can not, therefore, expect to have any one harrow that will meet every requirement of the farmer; on the contrary the more exacting he is as to the quality of his work the greater variety of harrows he will find useful to him.

Value of Leaves.—"J. H. B.," Chester Co., Pa. There is not much difference between the value of a ton of leaves, or that of a ton of straw, as manure. The percentage of ash is slightly greater in leaves than in straw, but the valuable constituents of the ash, as lime, potash, and phosphoric acid, are about the same.

Losing the Hair.—"T. J. S.," Tippicanoe, Ohio. When cows are fed with steamed food and kept in a warm stable during the winter, the usual period of shedding the hair is anticipated and considerable irritation of the skin is frequently noticed before the hair loosens. The cows are uneasy and rub themselves continually. The use of too much corn-meal produces the same effect, it being what is called "too heating." Some wheat bran or linseed cake meal should be fed with the corn, and salt should be given sparingly. A small quantity of sulphur should be given in the feed twice a week from January until the irritation of the skin disappears. There is not a book on "cattle," and probably never will be one, which can meet every circumstance which will arise in the care of stock. Much must of necessity be left to the judgment and experience of the owner.

Protrusion of the Rectum in Fowls.—"George," Wellesly, Mass. It is not unusual for the egg passage in fowls to become relaxed and protrude in a reverted position. In this case the parts should be bathed in some gentle, cooling, astringent lotion, as cold tea, alum water, or a weak solution of copperas. It should be immediately returned, and a piece of sponge moistened with the liquid or with tincture of opium should be bound upon the part by means of a suitable bandage. A pill of bread soaked in the tincture should be given to the fowl, and it should be confined in a dark, quiet place for a day or two. If the protrusion is repeated the fowl may be considered as incurable.

Use of Corn-Cobs.—"G. E. H.," Schuylerville, N. Y. We would rather burn corn-cobs if they can be procured in large quantities and spread the ashes than use them in any other way.

Price and Value of Plaster.—"E. H. M.," Danbury, Ct. Gypsum, or plaster, is a salt of lime containing a large proportion of water. It consists of 32.5 per cent of lime, 46.5 per cent of sulphuric acid, and 21 per cent of water, when pure. There is a bed of gypsum of excellent quality at Manlius, N. Y., and it also occurs abundantly from Syracuse westward to Genesee County. All through this district it can be mined and sold profitably at \$3 per ton, as it is brought to this country from Nova Scotia and sold for \$4 a ton. Our native gypsum is equally as good as the foreign. The man-

ner in which plaster acts as a fertilizer has been the subject of much discussion; it is soluble in water and can supply both sulphur and lime to the plant; it also has the property of fixing free ammonia, and some claim that this is its principal office.

Crop for Wet Soil.—"G. W. F.," E. Brookfield, Mass. The best crop for a rather wet soil would probably be oats. If the land is plowed in narrow ridges of ten to sixteen feet with deep, open furrows between them, the crop would suffer less from the wet. But before laying down to grass such land should be drained. Potatoes should never be planted on wet soil; they succeed best upon dry, warm land.

Improving a Cold Clay Pasture.—"Old Subscriber," Taunton, Mass. The first thing to be done to improve a cold clay pasture is to drain it. It should then be well harrowed to tear up the moss and loosen the soil upon the bare spots, and dressed with fifty bushels of lime per acre. Clover and timothy seed should then be sown and the surface rolled or again harrowed. If a fair dressing of fine manure could be given in the fall so much the better.

Draining Sandy Soil.—"W. T. L.," Marshall, Texas. There may very easily be a draining mania as any other kind; and the idea that every soil needs draining, whatever may be its character, savors much of such a mania. A sandy soil with a clay subsoil does not necessarily need draining. It is more than probable that the "clay" subsoil itself contains a large proportion of sand, and is not really a clay. If it should be broken up by subsoiling it would probably be all that is needed. We would advise an experiment of this kind before expending money upon drains.

Spasmodic Colic.—"G. F. J.," Mason Co., Texas. The readiest remedy for spasmodic colic in horses is to give an injection of warm water (not hot) with plenty of soap and a handful of salt dissolved in it. The horse should be walked about to excite the bowels to action. The injection may be given by means of a bladder with a pipe of elder, or other wood, made smooth and greased before using.

Wild Onion—Bermuda Grass.—"H. B. R.," Greenville, S. C. There is no thoroughly effective means of getting rid of these weeds but by summer fallowing, with several plowings and frequent harrowing. The roots of the grass must be picked off after each plowing or harrowing.

To Stimulate the Growth of Hair.—"G. W. E.," Walden, N. Y. The growth of hair upon the mane and tail of a horse may frequently be stimulated by rubbing the skin with a mixture of common whi-key and tincture of cantharides. If the follicles of the skin from which the hair grows have been destroyed by disease or other causes, it is not probable that any application will be effective.

Value of Gas Lime.—"Old Subscriber," Philadelphia. We have not a high opinion of the value of gas lime. We would rather pay twenty cents a bushel for ordinary lime than have gas lime brought to our place and delivered free. As an absorbent in place of plaster it is worse than useless. When gas lime is fresh it contains much sulphuretted hydrogen which it has absorbed from the gas in the process of its purification. This is poisonous to vegetation, and until it has passed off on long exposure to the air the gas lime should not be used for any agricultural purpose. By the action of the air some gypsum or sulphate of lime is produced, and the rest is mainly carbonate of lime, or what is known as mild lime, and of little use for any purposes.

How to Catch Hawks.—"A. K.," Lunenburg, Mass., sends us his plan of trapping chicken hawks, as follows: "Take a wire bird-cage, put a live chicken in it, and set it on the ground near the buildings in an exposed place. Then take a steel trap, tie a small dead chick on the pan. Then place a small stick about an inch and a half long under the chick's throat, so as to bring the head in the natural position. Open the chick's eyes, and he will look as if alive. Place the trap on the ground about three feet from the live chicken in the cage and set it. Shut up all the young chickens. When the hawk comes, he will hear the live chicken calling for its mother, and will go for it. But as he can not take it, he will quickly see the chicken on the trap and clutch it in a moment. Then you have him."

Epilepsy in Pigs.—"W. E. M.," Ash-tabula Co., Ohio. Pigs are very subject to epilepsy, probably because no animals are so subject to internal parasites, to the presence of which this affection is often attri-

buted. The attack occurs without any previous symptom. The pig suddenly staggers, drops upon his haunches, foams at the mouth, becomes rigid, and falls; the eyes protrude and are turned upwards, the muscles are violently convulsed, and the animal struggles involuntarily and unconsciously. Recovery is often very speedy, and the animal regains consciousness and goes about its business again. It is supposed that worms in the stomach and intestines, or minute eggs and larvae of parasites in the blood or the muscles, are the chief causes, although sometimes defective nutrition by reason of indigestion may doubtless produce it. An ounce of turpentine given daily twice, and followed by an ounce of castor oil, or two ounces of linseed oil, or an injection of soap and water in the rectum, has been recommended as proper treatment; but these are of doubtful benefit.

Inflammation of the "Hook."—"E.," Madison, O. When the covering membrane of the eye of an ox is seriously inflamed after the loss of the eye, it may be removed without injury either with a sharp knife by a surgeon or by the application of nitrate of silver in solution. The fungoid growth which occurs under such circumstances must be removed before there can be any cure. It would be best to have some professional advice about it.

Restoring Butter.—"J. O. B.," We know of no method of restoring rancid butter to a good condition. The ill smell and flavor is caused by a chemical decomposition of some of the constituents and the formation of some peculiar acids which can not be got rid of nor effectually disguised after they are once formed.

A Sheep with a "Propensity."—"B. S. H.," Tarrytown, N. Y. Sheep have a natural propensity for eating bark, which is incurable. They should not be allowed in a young orchard, and it is not safe to keep them in an old one for many days at a time. When they have become at home there they will be on the lookout for mischief.

Wart on a Horse's Breast.—"E. D.," Labette Co., Kansas. If the wart is small it may be removed by tying a stout fine cord or a fine iron wire tightly around the base. It will in time drop off. Otherwise it may be removed by touching it daily with a strong solution of nitrate of silver (lunar caustic). Be careful in using this solution, as it is poisonous.

The Best Sheep for Ohio.—"S. C.," Pomeroy, Ohio. If we should judge by the practice and success of sheep farmers in Ohio we should say that the Merino and its grades are the most profitable sheep in that State. What is the best sheep depends greatly upon the locality. It is certain that there are comparatively few places in which the large long-wool sheep can profitably supersede the full blood and the three-quarter or half-bred Merino. Those few places are where a large carcass of mutton is desirable, and where abundant pasture and roots are attainable. It must be remembered that by far the largest demand is for fine and three-quarter clothing wools, or, in other words, Merino wools, and that the demand for combing wools is far from general. Few common country woolen factories are able to card the long wools, and such factories use up the great bulk of the wool produced here.

Dick's Success.—"J. S.," Union Grove, Ill., relates the following story about Dick. He was called the Elephant from his immense size. He weighed alive 768 pounds at the age of two years. By that time he had eaten 40 bushels of corn, three liters of young pigs, three calves, and two dozen hens and chickens, all of which charged against him amounted to \$34. Dick required the services of four men and a span of horses to dress him, when he made 614 lbs. of pork, and sold for \$24.56. The balance against him is made up of little items which are not usually charged; otherwise he would have been a profitable pig. He was a Poland-China, and an ornament to his race. In one of his frisky moments he injured his back, and was therefore killed before he was fattened. "J. S." thinks if he could only raise a lot of hogs like Dick he would do well.

Bloody Urine.—"C. A. N.," Morristown, N. J. The cause of bloody urine in a cow after calving is a congested state of the blood-vessels of the kidneys consequent upon the recent condition of the cow. It is always accompanied by some fever, and a cooling aperient draft frequently relieves it at once. We would give 12 to 16 ounces of Epsom salts with an ounce of ground ginger, and apply cold, wet cloths to the loins. No corn-meal should be given, and linseed cake-meal should be substituted. Scalded crushed oats, given cold, may be alternated with the linseed. It is also advisable to keep the cow quiet for a few days and feed lightly.

LOOKING UP THE WEST BLUE, FROM THE FORKS OF BIQ AND WEST BLUE, NEB. 13

IF YOU WANT A FARM OR HOME, YOU SHOULD BUY OF THE BURLINGTON AND MISSOURI RIVER RAILROAD CO. IN IOWA OR NEBRASKA.

BECAUSE—Their prices are low, ranging for the best land from Three to Ten Dollars per acre.
BECAUSE—No payments are required of the purchaser for four years, except interest at six per cent.
BECAUSE—After the fourth year only one seventh of the principal is payable annually till the whole is paid.
BECAUSE—You are not required to go into a wilderness, these being well-settled States, the population of which is rapidly increasing.
BECAUSE—The mildness of the climate and fertility of the soil is such that the settler can pay for his farm from the products raised upon it long before the time when the principal becomes due.
BECAUSE—Failure of crops from drouth is unknown.
BECAUSE—Large allowances are made upon fare and freight, thus giving low rates on both to purchasers of this Company's lands.
AND YOU SHOULD BUY THIS YEAR.
BECAUSE—Purchasers of our lands in Nebraska during 1874 who cultivate one-half their land within two years from their purchase are allowed a reduction of twenty per cent on its price. **LARGE DISCOUNTS** also, FOR CASH, within One, Two, or Five Years.
 Send for Circulars, with full information on all points, to

GEO. S. HARRIS, Land Commissioner,
At Lincoln, Nebraska, for land in Nebraska. At Burlington, Iowa for land in Iowa.
JAS. R. WOOD, General Agent, 59 Clark St., Chicago, Ill.

ORANGE JUDD COMPANY, 245 Broadway, N. Y.

Carbonized Enamel IS AS PURE AS GLASS. The Bridgeport Mfg Co., OF BRIDGEPORT, CONN.

(Office, No. 88 Chambers St., New York),
Have the exclusive control of this valuable enamel, and are using it to cover all of their celebrated

American Submerged Force Pumps.

They also enamel pipe inside and out, which delivers the water chemically pure. The Enamel is composed of vegetable matter, baked on so hard that a blow does not break it, and it resists acids that eat gold.

Gentlemen: I have examined the sections of Carbonized Enamel Pipe submitted to me by you. It is superior to any pipe I have ever seen for resisting acids and conducting water from springs or for use in connection with pumps, etc. The Enamel adheres with astonishing tenacity, withstanding even heavy blows; and the surface of the metal where the enamel is beaten off seems to be protected against the ordinary action of water.

M. C. WELD,
Late Associate Editor *Am. Agriculturist*.

MUDGE & WOODS, No. 88 Chambers St., N. Y., are the exclusive selling agents of the Bridgeport Mfg Co. for the Licenses of States, counties, and towns rights for the American Submerged Suction and Force Pumps.

LOVEJOY'S METALLIC WEATHER HOUSES
 Indicate the changes in the weather, and are pretty mantel ornaments. The little lady appears in fair and the man in stormy weather, and they never make mistakes. Sent prepaid to any address, safely packed, upon receipt of \$2 (Two), by **ALVAN L. LOVEJOY**, Proprietor and Manufacturer, 229 Washington St. Boston.
 Special price to dealers.

Newly Revised and Enlarged Edition.

Practical Floriculture.

A Guide to the Successful Propagation and Cultivation of Florists' Plants.

By PETER HENDERSON,

Author of "Gardening for Profit."

Beautifully Illustrated. Price, Post-paid, \$1.50.

In this work, which has everywhere become so deservedly popular, not only is the whole "art and mystery" of propagation explained, but the reader is taught how to plant and grow the plants after they have been propagated. The work is not one for florists and gardeners only, but the amateur's wants are constantly kept in mind, and we have a very complete treatise on the cultivation of flowers under glass, or in the open air, suited to those who grow flowers for pleasure as well as those who make them a matter of trade. The work is characterized by the same radical common sense that marked the author's "Gardening for Profit," and it holds a high place in the estimation of lovers of floriculture. The new edition has been thoroughly revised by the author, and much enlarged by the addition of valuable matter.

The following are a few of the subjects embraced in the latest edition:

Laying out Flower Garden and Lawn; Designs for Grounds and for Greenhouses; Soils for Potting; Cold Frames; Hot-Beds; Greenhouses Attached to Dwellings; Modes of Heating; Propagation of Plants by Seeds and by Cuttings; Culture of the Rose and Tuberoses; Growing of Winter-flowering Plants; Construction of Bouquets, Baskets, etc.; Parlor and Window-Gardening; Wardian-Cases and Ferneries; Insects; What Flowers Grow in the Shade; Culture of Grape-Vines under Glass; The Profits of Floriculture; How to Become a Florist, etc., etc.

THE ILLUSTRATED Book of Poultry,

With Practical Schedules for Judging, Constructed from Actual Analysis of the Best Modern Decisions.

By LEWIS WRIGHT,

Author of "The Practical Poultry Keeper," "The Brahma Fowl," etc.

ILLUSTRATED WITH Fifty Colored Portraits of Prize Birds,

Painted from Life by J. W. Ludlow.

CONTENTS.

CHAP. 1.—Houses and Accommodation.	CHAP. 19.—Brahmas.
2.—The Selection of Stock.	20.—Malays.
3.—Feeding and General Treatment of Fowls.	21.—Game.
4.—Eggs and Incubation.	22.—Dorkings.
5.—Artificial Hatching.	23.—Spanish.
6.—The Management of Chickens.	24.—Hamburghs.
7.—Fattening and Killing.	25.—Polish Fowls.
8.—Poultry as National Food.	26.—French Breeds of Poultry.
9.—The Utility of "Fancy Points."	27.—American Breeds of Poultry.
10.—Commencing a Strain.	28.—Unclassed Varieties of Poultry.
11.—Mating Stock for Breeding Prize Birds.	29.—Bantams (Except Game).
12.—Rearing, Care, and Exhibition of Prize Poultry.	30.—Game Bantams.
13.—Shows and Judging.	31.—Wild Breeds of Poultry, Origin of the Domestic Fowl.
14.—Buying, Selling, and Exporting.	32.—The Guinea Fowl.
15.—Enemies in the Yard.	33.—The Turkey.
16.—Diseases of Poultry.	34.—The Pea Fowl.
17.—Technical Terms.	35.—Ducks.
18.—Cochins.	36.—Geese.
	37.—Swans.
	38.—Possible Additions to the Poultry Yard.

ORANGE JUDD COMPANY, 245 BROADWAY, NEW YORK.

SUPERIOR STANDARD WORKS.

Published by ORANGE JUDD COMPANY.

THE HORSE.

FRANK FORESTER'S HORSE OF AMERICA.

By HENRY WM. HERBERT.

Revised, corrected, enlarged, and continued to 1871,

By S. D. and B. G. BRUCE.

Always an ACKNOWLEDGED STANDARD, and now the most COMPLETE and AUTHENTIC Work on the HORSE. With steel-engraved portraits of Thirty of the most famous

REPRESENTATIVE HORSES, including pedigrees, histories, and performances.

Two superb royal octavo volumes of upward of 1300 pages.

Post-Paid, Ten Dollars.

WALLACE'S

American Trotting Register.

CONTAINING ALL THAT IS KNOWN OF THE

PEDIGREES OF TROTTING HORSES,

their ancestors and descendants, with a record of

All published performances in which a mile was trotted or paced in 2.40 or less,

from the earliest dates until the close of 1868, and a full record of the performances of 1869 and 1870.

Giving complete Summaries of over 6,000 Contests.

With an INTRODUCTORY ESSAY on the true origin of the American Trotter. And a set of Rules for the government of all trials of speed. By J. H. WALLACE, compiler of Wallace's American Stud-Book. Royal octavo.

Post-paid, Ten Dollars.

WALLACE'S AMERICAN STUD-BOOK.

VOL. ONE. BEING A COMPILATION OF THE PEDIGREES OF AMERICAN AND IMPORTED BLOOD HORSES,

from the earliest records, with an APPENDIX of all named animals without extended Pedigrees prior to the year 1840. And a SUPPLEMENT, containing a history of all Horses and Mares that have trotted in public from the earliest trotting races until the close of 1866. By J. H. WALLACE. Royal octavo of over 1000 pages, elegantly bound in extra cloth, beveled boards, and splendidly illustrated.

Post-paid, Ten Dollars.

Horse Portraiture. — BREEDING,

REARING, AND TRAINING TROTTERS. Preparations for Races, Management in the Stable, on the Track, Horse Life, etc. By JOSEPH CAIRN SIMPSON. Pos. octavo. Post-paid, \$3.00.

FIELD SPORTS.

Frank Forester's Field Sports.

Embracing the Game of North America, Upland Shooting, Bay Shooting, Wild Sporting of the Wilderness, Forest, Prairie, and Mountain Sports, Bear Hunting, Turkey Shooting, etc. 13th edition, revised and illustrated. Two post octavo volumes. Post-paid, \$6.00.

Frank Forester's Fish and Fishing.

100 engravings. Embracing a full illustrated description of the Game Fish of North America; Trout and Salmon Fishing; Shoal Water and Deep Sea Fishing; Lake and River Fishing; Trolling, Fly Fishing, etc. 12th edition. One post octavo volume. Post-paid, \$3.50.

Frank Forester's Complete Manual.

For Young Sportsmen, of Fowling, Fishing, and Field Sports. With directions for handling the Gun, the Rifle, and the Rod. Art of Shooting on the Wing. The Breaking, Management, and Hunting of the Dog. The varieties and habits of Game. River, Lake, and Sea Fishing. Post octavo. Post-paid, \$3.00.

Frank Forester's American Game in its SEASONS, Fully Illustrated and Described. New edition, post-paid, \$3.00.

The Dog.

By Dinks, Mayhew & Hutchinson. Compiled and edited by Frank Forester. Containing full instructions in all that relates to the Breeding, Rearing, Breaking, Kenneling, and Conditioning of Dogs, with valuable recipes for the treatment of all diseases. Illustrated. Post octavo. Post-paid, \$3.00.

The Dead Shot:

Or, Sportsman's Complete Guide; a Treatise on the use of the Gun, with Rudimentary and Finishing Lessons in the Art of Shooting Game of all kinds. By Marksman. Post-paid, \$1.75.

The Crack Shot:

Or, Young Rifleman's Complete Guide; being a Treatise on the use of the Rifle, with Lessons, including a full description of the latest improved breech-loading weapons; rules and regulations for Target Practice, and directions for Hunting Game. By Edward C. Barber. Post-paid, \$1.75.

Gun, Rod, and Saddle.

Nearly fifty practical articles on subjects connected with Fishing, Shooting, Racing, Trotting, etc. Post-paid, \$1.

Practical Trout Culture.

By J. H. Slaek, M. D., Commissioner of Fisheries, New Jersey. Fully illustrated and describing thoroughly all that is requisite to successful Trout Culture. Post-paid, \$1.50.

AGRICULTURE.

Woodward's Graperies and Horticultural

BUILDINGS. Designs and Plans of Hot-beds, Cold Pits, Propagating Houses, Forcing Houses, Hot and Cold Graperies, Greenhouses, Conservatories, Orchard Houses, etc., with the various modes of Ventilating and Heating. Post-paid, \$1.50.

Jacques' Manual of the Garden, Farm,

AND BARN-YARD. Embracing the Cultivation of Vegetables, Fruit, Flowers, all Field Crops, Details of Farm Work and Rearing Domestic Animals. New and Revised Edition. One volume. Post-paid, \$1.75.

Young Farmer's Manual.

Vol. I. The Farm and the Workshop, with Practical Directions for laying out a Farm, Erecting Buildings, Fences, Farm Gates, Selecting good Farm and Shop Tools, and performing Farm Operations. Fully illustrated. Post-paid, \$1.75.

Young Farmer's Manual.

Vol. II. How to Make Farming Pay, with full Details of Farm Management, Character of Soils, Plowing, Management of Grass Lands, Manures, Farm Implements, Stock, Drainage, Planting, Harvesting, etc. Illustrated. Post-paid, \$1.75.

Husmann's Grapes and Wine.

The Cultivation of the Native Grape and Manufacture of American Wine. By Geo. Husmann, of Missouri. Post-paid, \$1.50.

Elliott's Lawn and Shade Trees.

For Planting Parks, Gardens, Cemeteries, Private Grounds, and Avenues. Fully illustrated and described. Post-paid, \$1.50.

Fuller's Forest Tree Culturist.

The Cultivation of Forest Trees for Shade, for Shelter, for Fuel, for Timber, and for Profit. Illustrated. Post-paid, \$1.50.

ORANGE JUDD COMPANY, 245 Broadway, N. Y.

CRANDALL'S GREAT SHOW.—THE ACROBATS.

CRANDALL'S GREAT SHOW.—THE ACROBATS.

FUN FOR THE MILLION.

Come One, Come All! Here are jolly times for you, Girls and Boys, and for your fathers and mothers too; the old folks will be as much pleased as you. Here is genuine FUN for you, with nothing about the Show to injure your morals, but on the contrary, a great deal to develop your constructive or mechanical talents. These new ACROBATS of Mr. Crandall are the most wonderful toys we have ever seen. If you carefully examine each of the figures on these two pages, you will see that there are only SEVEN different pieces. A box of these ACROBATS contains four bodies, four heads, eight arms, eight legs, one flag, and six pieces of wood, or thirty-one pieces in all, and yet from these few elements you can not only make pictures similar to those before you, but many thousands of others. The pieces are variously colored, which can not be shown in our ink engravings. They are

so grooved and jointed and fitted, that they fasten strongly together in all conceivable positions. These amusing new toys are creating a furore among all the children (and old folks too) who have succeeded in getting hold of them. Every day's supply received at 245 Broadway, has "gone off like hot cakes," and correspondents are inquiring for them, their price, etc. They will soon be on sale by the toy dealers generally. The Orange Judd Company are selling them as fast as received at \$1 a box, delivered at 245 Broadway, New York, but if to be sent anywhere out of the city, the cost of carriage by express or otherwise must be added to the \$1 a box.

DON'T FAIL TO HAVE A LIBRARY. GOOD BOOKS For Farmers' Libraries.

In response to a request made of one whose thorough and practical knowledge on all matters pertaining to the Farm, Garden, and Household is so fully conceded that his opinions could not fail to secure attention and command respect were we permitted to give his name, we have received the following as his judgment concerning some of the works on our Catalogue of Books for Farmers.

Any of these Books will be forwarded, post-paid, to any address in the United States or Territories, on receipt of the price, by Orange Judd Company, 245 Broadway, New York.

For a Farmer's Library.

How Crops Grow,

(price \$2.00), and

How Crops Feed,

(price \$2.00.)

By PROF. SAM'L W. JOHNSON.

If I could have but two books in such a library it would be these, as I consider them the most important contributions to agricultural literature of modern times. They contain all of vegetable physiology and agricultural chemistry that any except special students need, and nowhere is there so much of agriculture condensed in so small a space. As works of reference they are indispensable.

Most farming operations are accomplished by force, applied through implements and machines, and a farmer should understand mechanics, at least sufficiently to apply force most economically. In this work the fundamental principles are clearly taught, and their application illustrated.

Farm Implements and Machinery.

By JOHN J. THOMAS.

Price \$1.50.

The New American Farm Book.

By R. L. and L. F. ALLEN.

Price \$2.50.

This is the best American work upon general farm management. It treats of the leading crops, buildings, draining, etc., and includes sufficient about animals of different kinds to meet the wants of most farmers.

American Weeds and Useful Plants.

By DR. WM. DARLINGTON.

Price \$1.75.

For the farmer who wishes to know something about the weeds upon his farm, as well as useful cultivated and wild plants, this will answer better than a general treatise on botany.

Country and Suburban Homes.

By D. T. ATWOOD.

Price \$1.50.

Such a library should have some work on domestic architecture. Most works upon the subject are costly on account of the designs. This is one of the best works, at a moderate price, and contains, with other matter, the method of building with concrete.

The Fruit Garden.

By P. BARRY. Price \$2.50.

After the farm crops, fruit is of the most importance. No work covers the whole subject so completely as this.

Gardening for Profit.

By PETER HENDERSON.

Price \$1.50.

Farms near cities often make more from garden crops than from farm crops. This is the best work on market gardening, and will serve for the family garden also.

Gardening for the South.

By WM. N. WHITE.

Price \$2.00.

An excellent garden book, and in the libraries for Southern farmers might be substituted for Henderson's, but it would be well to have both.

The New Book of Flowers.

By JOSEPH BRECK.

Price \$1.75.

I do not know of any book upon out-door flower gardening that on the whole is so good as this. Its teachings are sound, and style pleasing.

Mysteries of Bee-Keeping.

By M. QUINBY. Price \$1.50.

Practical Poultry-Keeper.

By L. WRIGHT. Price \$2.00.

The Pig.

By JOSEPH HARRIS.

Price \$1.50.

Draining for Profit.

By GEO. E. WARING, JR.

Price \$1.50.

Dairy Husbandry.

By X. A. WILLARD.

Price \$3.00.

Bees, Poultry, and Pigs are often made subjects of especial care by small farmers, and separate treatises on these are more likely to be asked for in a library like this than those upon the larger animals. Each of these is the best in its line.

So in farm operations, those of Draining and Dairying, especially the factory system, are not likely to be treated sufficiently in detail in general works.

As all the other works are matters of fact, it may be well to have a little pleasantries. This conveys much sound teaching on rural economy in a quaint style, and it is sometimes policy to sugar-coat your pill.

Tim Bunker Papers.

Price \$1.50.

Books for a Larger Library.

Besides all the works in the foregoing list, I would add the following:

- American Cattle.** L. F. ALLEN. \$2.50.
- Randall's Sheep Husbandry.** \$1.50.
- Hints to Horse Keepers.** H. W. HERBERT. \$1.75.
- American Cattle Doctor.** G. H. DADD. \$1.50.
- Insects Injurious to Vegetation.** DR. HARRIS. \$4.00.
- Fruits and Fruit Trees of America.** DOWNING. \$5.00.
- Cranberry Culture.** J. J. WHITE. \$1.25.
- Grape Culturist.** A. S. FULLER. \$1.50. (For the West would substitute Husmann's Grapes and Wine. \$1.50.)
- Grasses and Forage Plants.** C. L. FLINT. \$2.50.
- Forest Trees.** ARTHUR BRYANT. \$1.50.
- Landscape Gardening.** KEMP. \$2.50.
- Hops.** 40 cts. **Flax.** 50 cts. **Tobacco.** 25 cts. **Onion.** 20 cts. Essays.
- Bousingault's Rural Economy.** \$1.60.
- Play and Profit in My Garden.** ROE. \$1.50.
- Window Gardening.** WILLIAMS. \$1.50.

Books for a Still Larger Library.

In addition to those mentioned in the other two lists, I would name the following.

- Animals and Plants under Domestication.** 2 vols. CHAS. DARWIN. \$6. (This not suggested for its doctrine, but as a useful work of reference.)
- Hussey's National Cottage Architecture.** \$6.
- Landscape Gardening.** DOWNING. \$6.50.
- The Vegetables of America.** F. BURR. \$5.
- The Book of Evergreens.** J. HOOPES. \$3.
- Trout Culture.** DR. SLACK. \$1.50.
- Farm Gardening & Seed Growing.** BRILL. \$1.
- The Dog.** DINKS, MAYHEW & HUTCHINSON. \$3.
- Young Sportsman's Manual.** FORRESTER. \$3.
- Hunter and Trapper.** H. THRASHER. \$1.
- The Market Assistant.** DEVOE. \$2.50.
- Hedges and Evergreens.** WARDER. \$1.50.
- Pear Culture.** P. T. QUINN. \$1.
- Money in the Garden.** QUINN. \$1.50.
- How Plants Grow.** GRAY. \$1.25.
- How Plants Behave.** GRAY. 75 cts.
- Illustrated Horse Doctor.** MAYHEW. \$3.
- Peach Culture.** FULTON. \$1.50.
- Barns, Out-Buildings & Fences.** HARNEY. \$6.
- Cottages and Farm Houses.** WOODWARD. \$1.50.
- Country Homes.** WOODWARD. \$1.50.

A Man of Honor.

By GEORGE CARY EGGLESTON.

Finely Illustrated.

The publishers take pleasure in commending this as one of the most charming stories that has been presented to the American people. Mr. Eggleston has given to it, with rare fidelity, the local coloring of the part of the country where its scenes are laid. It is a realistic story of life in the Old Dominion. Its people are ladies and gentlemen. Robert Pagebrook, the "Man of Honor," is every inch a man, and his sayings and doings at once attract and hold the reader's attentive interest. It is a love-story, too, and has the merit, which is not as common as it might be nowadays, of ending to the reader's entire satisfaction.

NOTICES BY THE PRESS.

A capital picture of Life in Old Virginia before the war is to be found in Mr. George Cary Eggleston's "A Man of Honor." Virginian hospitality, Virginian consenship, Virginian housekeeping, are portrayed in accurate and attractive colors. It is a life which the author has himself known and loved, and he writes of it with a warmth that comes from the heart.—*N. Y. Evening Post.*

Really readable in the most refreshing sense of the term—a story of the most amusing and attractive interest.—*St. Louis Times.*

It is written in an off-hand manner, and is bright and amusing.—*Worcester, (Mass.) Spy.*

With Virginian life as a specialty, Mr. Eggleston has drawn a simple, straightforward, truthful, and withal, artistic picture of Southern society. It is sketchy, perhaps too much so, but the sketches are all vigorous and show the hand of a practiced artist. In forming the characters of his book it is evident that Mr. Eggleston has drawn oftener on his memory than on his imagination; that he has lived among the people whom he describes, has heard them talk, and seen them under all the moods of ordinary life.—*Boston Daily Advertiser.*

CONTENTS.

- Chapter 1. Mr. Pagebrook gets up and calls an Ancient Lawgiver.—2. Mr. Pagebrook is Invited to Breakfast.—3. Mr. Pagebrook Eats his Breakfast.—4. Mr. Pagebrook Learns Something about the Customs of the Country.—5. Mr. Pagebrook Makes some Acquaintances.—6. Mr. Pagebrook Makes a Good Impression.—7. Mr. Pagebrook Learns Several Things.—8. Miss Sudic Makes an Apt Quotation.—9. Mr. Pagebrook Meets an Acquaintance.—10. Chiefly Concerning "Foggy."—11. Mr. Pagebrook Rides.—12. Mr. Pagebrook Dines with his Cousin Sarah Ann.—13. Concerning the Rivulets of Blue Blood.—14. Mr. Pagebrook Manages to be in at the Death.—15. Some very Unreasonable Conduct.—16. What Occurred Next Morning.—17. In which Mr. Pagebrook Bids his Friends Good-by.—18. Mr. Pagebrook Goes to Work.—19. A Short Chapter, not very Interesting, perhaps, but of some Importance in the Story, as the Reader will probably Discover after awhile.—20. Cousin Sarah Ann Takes Robert's Part.—21. Miss Barksdale Expresses some Opinions.—22. Mr. Sharp Does his Duty.—23. Mr. Pagebrook Takes a Lesson in the Law.—24. Mr. Pagebrook Cnts Himself Loose from the Past and Plans a Future.—25. In which Miss Sudic Acts very Unreasonably.—26. In which Miss Sudic adopts the Socratic Method.—27. Mr. Pagebrook Accepts an Invitation to Lunch and Another Invitation.—28. Major Pagebrook Asserts Himself.—29. Mr. Barksdale the Younger goes upon a Journey.—30. The Younger Mr. Barksdale Asks to be Put upon his Oath.—31. Mr. William Barksdale Explains.—32. Which is also the Last.

ILLUSTRATIONS.—By M. WOOLF.

"Now I've Got You" (Frontispiece).—Mr. Robert Pagebrook was "Blue."—"I Fall at Once into a Chronic State of Washing up Things."—"Foggy."—Cousin Sarah Ann.—The Rivulets of Blue Blood.—Miss Sudic Declares Herself "so Glad."—"Let Him Serve it at Once, Then."—"Very Well, Then."—"I'm as Proud and as Glad as a Boy with Red Morocco Tops to his Boots."

PRICE, POST-PAID \$1.25

ORANGE JUDD COMPANY,
245 BROADWAY, NEW YORK.

ORANGE JUDD COMPANY,
245 BROADWAY NEW YORK.

THE HOOSIER SCHOOL-MASTER.

By EDWARD EGGLESTON.

Finely Illustrated, with 12 Full-Page Engravings, and Numerous Other Cuts.

NOTICES BY THE PRESS.

It is full of quaint humor, a tender pathos, and vivid descriptions.—*New York Standard*.

The "events" are stirring and dramatic, and the style is quiet, impersonal, and almost epigrammatic in its ability to lay bare an entire situation or character in a sentence or phrase.—*Brooklyn Daily Eagle*.

It is at once quaint and truthful, and illustrated as it is by masterly cuts, it should be one of the most popular books.—*Christian Standard* (Cincinnati).

For realistic conception and life-like delineation of character, it is not excelled by any American story.—*Methodist*.

Some passages in it, for life-like delineation and the simple, artless beauty which constitute the highest perfection of story-writing, are equal to some of the very best passages in Dickens.—*Religious Telescope*.

PRICE, POST-PAID.....\$1.25.

The End of the World.

A LOVE STORY.

By EDWARD EGGLESTON,
Author of "The Hoosier School-Master."

WITH

Thirty-two Fine Illustrations.

NOTICES BY THE PRESS.

The personages who figure in this story are, with one exception, country people—such men and women as Wordsworth loved to study. It is not every man, whatever may be his talents, that can safely enter this sphere of literary labor. To be successful in it, he must possess exceptional qualities; but for those who know how to find it, here there is gold of the purest, richest kind. In such a work, however, there is no convenient place where mediocrity can rest; there is nothing but absolute failure or absolute success. And Mr. Eggleston has succeeded. His power lies in the delineation of character. The plot is ingenious and natural, the incidents are managed with great skill, and there are many descriptive passages of singular force and beauty. But the strongest impression left on the reader's mind as he closes the volume is that he has been in the company of very interesting men and women, and has made a number of new and valuable acquaintances.—*The Albion*, New York.

Price, Post-paid, \$1.50.

The Mystery

OF

Metropolisville,

By EDWARD EGGLESTON,

Author of "The Hoosier School-Master," "The End of the World," etc.

"UP FOR REPAIRS,"

A Beautiful, New Picture for Every Subscriber to the

American Agriculturist

FOR 1874.

An exquisite Oil Painting by the celebrated American Painter, Mr. B. F. Reinhart, executed expressly for the *American Agriculturist* and entitled

"UP FOR REPAIRS,"

has been most successfully reproduced in Chromo by the well-known firm of Bencke & Scott. It is a picture of a scene in childhood, which many will recognize as what they have themselves witnessed or been actors in, and can not fail to please both old and young.

The Publishers will give this beautiful Chromo

To Every Subscriber

to this paper for the year 1874 received after this date, as detailed below. It is ready for immediate delivery at 245 Broadway, Free of Charge.

If to go by mail, 10 cents must be sent to cover cost of packing and postage. For 25 cents it will be Mounted, Varnished, Packed, and sent Post-paid.

N. B.—The Chromo will be delivered:

- At the Office, Unmounted, Free.
- " " Mounted, 15 cents extra.
- Sent by Mail, Unmounted, 10 cents extra.
- " " Mounted, 25 cents extra.

We advise all to have them mounted before leaving the office, as in the large quantities we put up we are able to mount them for a quarter of the cost or doing it singly, and better than it can usually be done elsewhere.

The picture is designed for every subscriber upon the terms stated above, which please read carefully; and on these terms all are alike entitled to it, whether their names come singly at \$1.50 each, or in Clubs of Four for \$5, or Clubs of Ten at \$1.20 each, or in Clubs of Twenty or more at \$1 each. Subscribers in Premium Clubs will also thus be entitled to it.

N. B.—A few of the beautiful pictures entitled "MISCHIEF BREWING," which have been given to so large a number of subscribers, are still in stock, and, while any remain, subscribers to the *American Agriculturist* can have their choice between this and the new Chromo "UP FOR REPAIRS"; but the choice must be named at time of subscribing. ORANGE JUDD COMPANY,
245 BROADWAY, NEW YORK.

Window Gardening.

By HENRY T. WILLIAMS,

EDITOR OF THE HORTICULTURIST, AND HORTICULTURAL EDITOR OF THE NEW YORK INDEPENDENT.

FINELY ILLUSTRATED.

There can be no more attractive ornaments about the house than beautiful flowers, and Mr. Williams's book tells exactly how they may be arranged, and what flowers to plant. It is seldom that a book is published on such subjects containing so much practical information.

—The World (New York).

CONTENTS:

- Chap. 1.—Window Gardening—Its Pleasures—Increase in Popular Taste—Refraining Influences.
- Chap. 2.—Location and Designs for Window Gardens.
- Chap. 3.—General Management of Window Gardens.
- Chap. 4.—Special Care of Window Gardens.
- Chap. 5.—Insects, and how to Kill them.
- Chap. 6.—Propagation from Seeds, Cuttings, etc.
- Chap. 7.—Propagating Boxes, Heating Cases, etc.

IMPORTANT TO INVENTORS.
American Agriculturist
PATENT DEPARTMENT

In compliance with the request of numerous inven-
 tors, we have organized a
PATENT DEPARTMENT
 in connection with this office for the transaction of all
 business connected with
Securing Patents
 in the United States and foreign countries.
 The character for

Reliability
 which has been maintained by the AMERICAN AGRICUL-
 TURIST for more than thirty years will be carefully
 guarded in this as in other departments.

All Inventors
 desirous of procuring patents at moderate cost are in-
 vited to forward (express prepaid) a model of their in-
 vention, with a brief description of its working. The
 model should not exceed one cubic foot in dimension.
 Upon receipt of model an opinion as to patentability
 will be given free of charge.

Preliminary Examination
 at the Patent Office, to determine patentability,
 will be promptly made for a fee of \$5.
Litigation of Patents.

The services of the best counsel have been
 secured to prosecute or protect before the
 U. S. Courts and the Patent Office the claims
 of those intrusting their business to this
 agency.
 Specifications, drawings, engravings, models,
 and all other appliances furnished at
 moderate prices.

In all dealings with this Department in-
 ventors may depend upon promptness, fidelity
 to their interests, and the best services
 which can be rendered by thorough experts.
 For full particulars, address

The spring is entirely under the seat, and out of the way. Every spring fully warranted. After using them six months, if not found as represented, can be returned, and money will be refunded. Every Farmer should have a pair. Price \$4.50. Send for circular.
BENJ. F. WELLS, Sole Agent,
 47 Dey St., New York.

JOHN ANDROSS.
 BY
REBECCA HARDING DAVIS,
 Author of "Life in the Iron Mills," "Dallas Galbraith," etc., etc.
ILLUSTRATED.
NOTICES BY THE PRESS.

The story is of intense interest, and holds the reader from its commencement to its close, and gives much food for thought regarding the workings of political rings and government frauds in our large cities.—*Post*, Salem, Mass.
 The characters and their work are strongly but no doubt truthfully drawn. Aside from its literary merit, the book deserves credit for calling attention to a crying shame of our time.—*Christian Advocate*, Pittsburgh, Pa.
 It will at once enchain the attention of the reader, and prove vigorously and skillfully written, by this among the foremost novel writers of America.—*Commonwealth*, Boston, Mass.

Of a story of Mrs. Davis it is hardly necessary to say that it holds the reader's absorbed attention from beginning to end. Though the interest of the plot is very considerable, it is subordinate to the higher interest of the description and development of character. There is a great deal of very life-like painting of people and manners.—*Christian Union*, New York.
 The characters are well drawn, the incidents are full of interest, and the plot sustained with consistency and power.—*Daily Spy*, Worcester; Mass.

We are constantly struck with the out-cropping of the one golden thread that holds all her writings together, and never fails to shine through the web of whatever plot she weaves about it—that singleness of point and moral more characteristic of her writings than of any other we know of, and which is, broadly stated, a self-sacrificing devotion to duty.—*Daily Standard*, Bridgeport, Ct.
 Her hero is a man entangled by the great Ring of Pennsylvania, who is sent by this corporation to the State Senate with a hold of criminality to keep him in hand, who even then attempts to break loose and join the party of honesty, but is at the crisis brought in check again by the Ring, with the still more potent motive of love. . . . The plot is very well wrought, and the denouement is powerfully conceived and managed.—*New York Evening Mail*.

Price, Post-paid, \$1.50.
ORANGE JUDD COMPANY,
 245 BROADWAY, NEW YORK.

Agricultural Chemical Analysis.
 After E. Wolff, Fresenius, Krooker, and Others.
 Edited by **G. C. CALDWELL,**
 OF CORNELL UNIVERSITY.
PRICE, POST-PAID, \$2.00.

In this work Professor Caldwell has brought together the processes of analysis which apply especially to soils, fertilizers, animals and plants, and their products. He has tested the methods of the best foreign authorities, and presented them in a compact hand-book. Such a work has long been needed by all who teach agricultural chemistry, and by analytical chemists generally. Professor Caldwell modestly calls himself the editor, but his book shows that he has not contented himself with editing the works of others, but has given much of his own experience.
ORANGE JUDD COMPANY,
 245 BROADWAY, NEW YORK.

WANTED.—The United States Life Insurance Company is now re-organizing its Agency Department, and is prepared to negotiate with gentlemen of business ability to act as Agents. Previous connection with the business is not considered necessary.
 Apply at the Home Office, 261 Broadway, New York. **JOHN E. DEWITT, President.**

One Large Quarto Volume, sent Free by Mail or Express, on receipt of Price.....\$10.00.

CARPENTERS' and BUILDERS' ASSISTANT,

And Wood Workers' Guide,

By L. D. GOULD, Architect and Practical Builder.

Containing 23 Plates, fully described; also, tables of the strength of materials; technical terms used by carpenters, etc., etc. This work is intended to combine all the knowledge the workman requires to construct any design in carpentry, by a new and easy system of lines, reducing the science of construction to an agreeable and pleasant occupation, rather than an unpleasant task. One 8vo. volume, bound in cloth. Price.....\$3.00.

ARCHITECTURE.

By CUMMINGS & MILLER.

A Practical Book on Architectural Details; containing over One Thousand Designs and Illustrations, showing the manner of constructing Cornices, Doorways, Porches, Windows, Verandas, Railings, French Roofs, Observatories, Plazas, Bay-Windows, Cut-Stone Work, various styles of Modern Finish, and Street Fronts of Houses, Stores, etc., etc. One Large Quarto Volume. Price, post-paid....\$10.00.

Loth's Practical Stair-Builder.

A complete Treatise on the Art of Building Stairs and Hand-Rails. Designed for Carpenters, Builders, and Stair-Builders. Illustrated with Thirty Original Plates. By C. EDWARD LOTH, Professional Stair-Builder. One large Quarto Volume. Bound in Cloth. Price.....\$10.00.

A New and Revised Edition of Peter Henderson's well-known Work, Gardening for Profit.

A Guide to the Successful Cultivation of the Market and Family Garden.
By **PETER HENDERSON.**
Finely Illustrated. Price, Post-paid, \$1.50.

The success of this book has probably not been equaled by that of any horticultural work of the present day. Its popularity is due to the fact that it tells just what people wish to know—the way in which the author made money by gardening—and puts in a plain, striking light all the requisites to success. The writer was not afraid to have people know that he cultivated his land for profit, and, more than that, he was quite willing that all should know and practice, if they chose, the very processes which he had found most conducive to the desired end. The late Horace Greeley said of this book: "There are marvels of transformation and rapid reproduction recorded therein, which might well shame the dull fancy of the author of Aladdin or of Kaloolah. There is no theory about it; a man who has made himself rich by market-gardening plainly tells our young men how they can get rich as easily as he did, and without wandering to California or Montana for it either." And tens of thousands who have read and profited by the work could give similar testimony. It is unquestionably the most thorough and the best book of its kind that has yet come from the hand of an American author. In the revised edition several new chapters will be found, and in the selection of varieties much has been changed, though the plan of the work is the same as before.

The following is a specimen of hundreds of letters that have been received concerning this work.

I was an early purchaser of "Gardening for Profit," a reading of which made the possession of "Practical Floriculture" a necessity. I sincerely thank the writer for giving us non-professionals what we have so long needed—some plain common-sense directions for our assistance—and for having exploded some outrageous humbugs which have been perpetuated in all previous works on gardening and floriculture from time immemorial, tending to produce the conviction that nothing but professional skill could raise a vegetable or flower. **LUTHER NEWCOMB,**
May 4, 1873. Montpelier, Vt.

The following voluntary notice of this book comes from a Western market gardener and shipper of vegetables, and is a specimen of similar testimony from very many quarters.
"March 23d, 1874.

"If this should go to Mr. Henderson, I would say that I believe the gardeners of this country would gladly hail another edition of 'Gardening for Profit'; at least, I thank him for that little work. Through its influence I left a paying manufacturing business and began to follow its teachings. This was three years ago. Now I have a market garden of thirty acres and 400 four-foot sash, and enjoy myself as I never did before. Again I thank him."

Either of the above books sent post-paid on receipt of price by

ORANGE JUDD COMPANY, 245 Broadway, N. Y.

Beckwith Sewing Machines

\$12 and \$20.

We have offered as a Premium, and also for sale, for more than a year past, the **Beckwith Sewing Machine**, which has been fully described in previous numbers of this paper. We have already given and sold more than one thousand of these machines, and testimonials of satisfaction have come from every quarter.

We still offer the **Beckwith Sewing Machine, Improved**, price \$12. A new and very simple braiding-foot has been made, by which a child can sew on braid without the least trouble, following any desired pattern with ease; also a new arm, spiral spring and lever for raising the presser-foot, all of which are now set in a position that leaves the needle free to be threaded. The joint is much enlarged, and the machine is otherwise greatly strengthened and improved. The use of the braider-foot alone will be valued more than the cost of the machine.

Each of these machines is put in a neat, compact box, with *hemmer and guide; oil-can with oil; thread; different-sized needles, etc.*, with full Printed Directions for using. On receipt of \$12 we will send one of these machines to any address, expressage to be paid by the purchaser.

The Machine as a Premium.

We will give one of these \$12 machines to any one who will collect and forward sixteen subscribers to *American Agriculturist* for one year, at \$1.50 each, expressage on the machine to be paid by the recipient of it.

THE BECKWITH PORTABLE FAMILY SEWING MACHINE.

PRICE \$20.

Enlarged and Improved. Its Weight is 7 Pounds.

While we continue the offer of the Improved \$12 Machine as heretofore, we now offer the new

PORTABLE FAMILY MACHINE,

price \$20, which comprises all the excellencies of the former, with many valuable improvements. Its size and power are increased, and its capacity thus very much enlarged, without impairing its portability. There have been added cam and eccentric movement, a balance-wheel, and also an oscillating needle-clamp, by which the length of stitch can with the greatest ease be changed to the finest shade of variation without touching the needle.

To any one sending us \$20, we will send one of the Machines (packed in a neat, portable case, with handle to carry it easily), expressage to be paid by purchaser.

The Machine as a Premium.

We will give one of these \$20 Machines to any one who will collect and forward to us **Thirty Subscribers to American Agriculturist for one year at \$1.50 each, or One Hundred at \$1 each, expressage on the Machine to be paid by the recipient of it.**

Almost any lady can readily secure the small number of subscribers required to get either the \$12 or the \$20 Machine as described above; or some friend can thus obtain it for her as a present.

THE MISFORTUNE OF A RUP-

TURE can be easily remedied by wearing the new Elastic Truss, without metal springs. It retains the rupture under all circumstances, is worn night and day with perfect comfort, and soon effects a permanent cure. Sold at a moderate price. It is sent by mail to all parts of the country, by the Elastic Truss Co., No. 683 Broadway, New York City. Suitable Agents would be appointed on very favorable terms where none now are.

ENGLISH CHANNEL

PRETTY FEET should be shod in **ENGLISH CHANNEL** Shoes. All ladies insist on having them. They show a dark line around the sole near the edge. They never wear ragged. They wear longer, and cost no more.

INVENTORS

Who wish to secure **PATENTS** should write to **MUNN & CO., 37 Park Row, New York, for Advice and Pamphlet, 108 pages, FREE.**

BEAUTIFYING COUNTRY HOMES.

AN ELEGANT QUARTO VOLUME.

By **J. WEIDENMANN.**

PRICE, POST-PAID, \$15.00.

This magnificent work is illustrated not only with numerous fine wood-engravings, but also with seventeen full-page and seven double-page colored lithographs of places already improved. It embodies the results of a long practice in landscape architecture and rural adornment, and while its teachings are in accordance with the received rules of art, they are thoroughly practical in their character. It is one of the most elegant, and ought to prove one of the most useful works ever issued in the country. The work, both in its letter-press and colored lithographs, is beautifully printed, and it is elegantly bound in beveled boards.

AMERICAN AGRICULTURIST.

NEW YORK, SEPTEMBER, 1874.

In September the farmer begins to receive returns for months of care and labor. He has hitherto been easting bread upon the waters, and now it returns after many days. His reward is now in proportion to his faith. If he has believed in what he has read in these pages, in the fruits of his own and other's experiences, and in the teachings of intelligence and common sense, he has not been chary of hard work, constant attention, and generous treatment of his land and crops; he has fed his land, and now his fields will feed him in return. Now the farmer learns that out of nothing, nothing comes. If he has put nothing upon his fields, his crop is poor. If, on the other hand, he has well and intelligently fertilized and worked, he finds in spite of seasons, that he has barns full, and the promise of harvest is surely fulfilled to those who carefully meet the requirements of seed time. The better the farmer the better the crops, and the risks of seasons and unfavorable weather, bring disaster only to the farmer who neglects the precautions by which he may avoid them. Generally the fall wheat crop has yielded well, and has been harvested cheaply and in good condition. There is a good market for it. Crops in Europe are not over an average, and there are vast deficiencies in stocks to be made up. Besides our spring crops will be deficient. Spring wheat is a comparative failure in many places, and the surplus of the fall crop will be partly needed to meet this deficiency. Oats and corn will be below the average, and hay is short in the West, although plentiful in the East. Prices therefore will be satisfactory on the whole, if grain is not sacrificed, and there is no good reason why farmers should hasten to put their grain into the hands of speculators, that they may hold it for a rise. The outlook is favorable to steady prices if not to some advance. The Agricultural Fairs are now in season. To attend the State and County Fairs, should be made a duty as it should be a pleasure. Every farmer should strive to be a competitor at his local fair. We wish there could be premiums offered for the best managed farms here, as there are in England, and plowing matches for farmers' boys. Competition induces study as well as work, and it is thought and study that we want. No farmer in the world works harder or more

steadily, than an American farmer, or has fewer idle days. But with the increase of machinery, and the need of better farming, more study and knowledge are needed. To give the best matter for study, and the most trustworthy knowledge, is the whole purpose of the American Agriculturist. And it is our desire to reach every farmer in the country, for we work for the whole country, and for no one section or locality alone.

Hints about Work.

Plowing for winter wheat, should be finished by the first week of September in this latitude, and in the West as far South as Kansas. Further South, a month later will be time enough. Two plowings of an oat or barley stubble should be given, that the scattered grain which has sprouted may be killed. It is a mistake to suppose that oats are a protection to the young wheat. On the contrary they are weeds, and rob the young wheat plants of their nourishment, to their injury. We do not care to have the surface too fine and mellow. A cloddy surface will do no harm if there is a mellow bed below for the seed. In good time these clods will crumble down, and until then they are a protection to the plants.

Manuring.—A few loads of good well-rotted manure harrowed into the surface, or covered with a very light furrow at the second plowing, is better than twice as many loads spread in the winter as a top dressing. Strong plants at the start are what we want. If there is food at hand, the roots from the sprouting seed find it and make a rapid growth, when growth is safety. Strong fibrous roots spreading far into the soil, are not so easily thrown out by frost, as weak puny short roots which have no hold. Thousands of young plants die for want of food in poor soil, long before any frost touches them. The manure and seed should go into the ground together. Top dressing in winter is an after expedient, useful when nothing better can be done. But it is better for the crop that it should not need it. Where no manure is at hand, 200 lbs. of Peruvian guano per acre, will give the wheat or rye a fine start. It may be followed later by a top dressing.

The selection of seed is important. Changes of seed should be made with caution, and the whole crop should not be risked at once. Experiment wisely, that is, cautiously. The fine white wheats require rich soil, and strong limestone land. The hardier red or amber wheats, are safer on gravelly land, or where the soil is not so rich. A great improvement may be made, by choosing the best and heaviest seed each year from local sources. Above all things avoid weeds. Sow clean seed, if it is picked over by hand, upon a portion of the field at least. A stock of clean seed may be raised from this for another season.

The Quantity of Seed.—This depends much upon its quality. Six pecks of plump seed that has not been broken in thrashing, and that is free from weeds, is better than two bushels taken at random from the bin. On rich clean ground wheat will lodge, that is too thickly sown. On poorer soils two bushels per acre is little enough.

Pickling the Seed.—Smut may be prevented by soaking the seed in strong brine. Pour the seed slowly into the brine in a large tub. All light imperfect grains will float and should be removed. Stir the seed, and then scoop it out on to the barn floor, and leave it for an hour to dry, or a few handfuls of finely slacked lime will dry it at once. Pickling the seed is so great an advantage, and so little trouble, that it should never be neglected, even where smut is not prevalent.

Sowing.—Experiments made in England, showed that three-inches was the best depth at which to sow wheat. Before the sprouts appeared above ground, there was abundant growth of roots, and a larger proportion of plants escaped winter killing. Even sowing can only be done by the drill. All the seed is then covered. This is not the case in broadcast sowing. If the ground is too rough or stony for the drill, it is a lesson for another year, to be remembered and acted upon in time.

A Ditching Machine.—"N. D.," New Iberia, La. We have seen a ditching machine in operation upon the prairie soils of the West, which performed excellent work. It is the Carter ditching machine, is drawn by two or four horses, cuts a deep, narrow, smooth trench, and leaves the earth upon one side of the ditch. We do not know the manufacturer's address, but from the numerous inquiries for such a machine, it is a thing that ought to be made known in the usual way.

Rye.—This crop is worth growing, both for the straw and for the grain. A few acres will furnish bands for a large field of corn, and the chopped grain with corn is excellent feed for horses. Two bushels of seed per acre is sufficient. If kept separate at harvest it may be sown at the end of a wheat field. Upon poor, light, or gravelly soils, it should be sown in preference to wheat, as a more profitable crop.

Grass Seed.—Few farmers are able to get their soil in sufficiently good tilth, or rich enough to sow grass seed alone with profit. Where it can be done conveniently, a crop of hay may be mown the next season. In this case half a bushel of timothy is a proper quantity of seed. Generally, however, it is best sown with fall grain. If clover is to be sown in the spring, six or eight quarts of timothy per acre, should be sown immediately after the grain is drilled or harrowed in. It will find sufficient covering by the gradual mellowing of the soil. A quarter of an inch of covering is all that is needed. Sow only clean fresh seed. If the seed is old, one half more will be needed.

Fall Fallowing.—This should not be neglected. The corn stubble should be thoroughly cultivated between the shoeks, as soon as the corn is cut. Potato ground that is unoccupied should be harrowed, and every opportunity offered for the weeds to grow. A harrowing will then destroy them, and start others to grow which may be killed in the spring. Every way in which weeds may be killed should be studied and put in practice.

Clover Seed.—It is useless to try to get a crop of seed and fodder at the same time, from a late cutting of clover. It is best to devote all the attention to saving the seed. If it is exposed to rain it is easier thrashed, and the labor saved is of more value than the poor fodder which could be secured. It should be thoroughly dry when put into the barn. If taken from home to be hulled it is worth while to save the chaff for the manure pile. We have hulled clover in the ordinary thrashing machine, by lowering the concave and fastening a strong board in front. The seed and chaff will work out below the cylinder if one side is opened.

Buckwheat.—This crop upon low ground is easily injured by frost. Rather than allow the crop to be injured, it is better to cut it early, although some of the grain be green. In the stook it is safe, and the unripe grain will mature by a few days exposure. In drawing home the crop, spread a barn sheet in the wagon to catch the loosened grain. Thrash, as it is drawn from the field. Clean up the seed at once to prevent heating, and put it into shallow bins. If the grain heats it should be turned. The first grain in the market always brings the best price.

Beans.—Harvest beans carefully to preserve the color. Rain or mildew will reduce the value 50 per cent. Stack in tall narrow heaps around single stakes set in the ground, and cap the stacks with straw to shed rain. Thrash as soon as dry, and store in barrels in a dry place.

Cutting Corn.—This is the great work of the month. As soon as the corn is glazed to the tips of the ears, it is ready to cut. If struck with frost the fodder is seriously injured. Topping corn is excusable only where fodder is worth nothing. We have not found that place yet. The heaviest Western corn may be profitably cut up to the butts for fodder. The practice of leaving a hill uncut to hold up the shock, is more troublesome in the end than setting up the shoeks securely at first. Spread the butts well, and tie the tops of the shoeks with rye straw bands. There will be no more shocks blown over, than if a hill is left uncut in the center of each. Our plan is to cut five hills each way, or if in rows 20 feet of each row for five rows. This makes a shock that will dry thoroughly in two weeks. Corn cut before the 10th should be husked before the end of the month. Cold fingers and benumbed hands make slow husking. A good husking machine is made, but strangely no one seems to want it. There are a great many farmers who could profitably invest \$100 in a good corn husker.

Potatoes.—As this crop ripens it should be dug. Tender early sorts such as Early Rose, are often damaged greatly by wire worms or white grubs. We never made anything, but often lost, by storing potatoes instead of selling them. 75c. a bushel is worth more now than a dollar in spring. A good way to dig potatoes in drills, is to plow a furrow close to the row going up, then do the same down the next row; then plow beneath the first row turning it upon the first furrow, and so on through the field. The potatoes are all exposed and can be raked out with the hoe or barrow. To sort them in the field is a saving of time and labor. Gather up the tops with the horse rake, and cart them to the barn-yard.

Vermin are now gathering their harvest, and making nests for the winter. Get rid of the dogs, and encourage cats around the buildings. Feed them regularly, and they will hunt with double vigor. Open up all hiding places to the light, and have passages around and under the bins in the granary, where cats can get in and out. Place tin caps on the posts of the corn cribs. Rats, although sagacious, may be vanquished by perseverance.

Feeding Animals.—Flesh and fat are now made at half the cost of feeding in November. Much food may now be gathered up, which costs little, and would otherwise be wasted. Boil the screenings from the thrashing machine with small potatoes for the hogs, and feed sound old corn, or what is better, corn meal. Pork made with soft corn is not cheaply made. Keep the soft corn and nubbins for the store hogs. Now is the season to buy stock for feeding during the winter, to make manure. Farmers who are economical with their feed, and have some to spare, had better buy a few head of stock, than sell hay or straw. But buy with judgment; an animal well bought is half sold.

Sheep.—If sheep are not marked, this should be done forthwith. For valuable breeding sheep, metallic ear-marks should be used. Common sheep should be marked with red chalk, or Venetian red and oil. Ewes may be marked across the shoulders; wethers across the rump; and those that are to be sold off, with a stripe down their backs. If the flock has not been separated, no time should be lost in doing this. Ewes and wethers, selected for fattening, should be put by themselves into a good pasture, and fed a little grain. Lambs should be put, along with a dry ewe for company, into a field away from the rest of the flock. As the ewes come into season, the danger from dogs is greatly increased, and watchfulness should be redoubled. It is in vain to depend upon bells, except as a means for giving alarm.

Milk Cows should receive the best attention. September packed butter is equal to June butter in quality, and will keep as well. Fresh cows at this season are very profitable, and pay well for the extra care and attention needed.

Young Stock.—Young growing animals should go into winter quarters in good condition. Their future value greatly depends upon their care during their first winter. They must be kept growing. Food must not be stinted, and shelter from early cold rains should be provided for them.

Horses.—When frost has arrived, pasture is no longer sufficient for horses. Frosted grass has but little nourishment. Fresh corn stalks cut and mixed with meal, or chopped oats and corn will make excellent fodder, and be greatly relished.

Old Stock.—There is no profit in feeding stock that is past its prime. It is waste of feed and money. As soon as any animal begins to fail it should be disposed of. Old cows, old oxen, old sows, and old hens, form the bulk of the stock upon many farms. The young animals are sold off. This is the reverse of what is wise and profitable.

Meadows and Clover Fields.—It is an unprofitable practice to pasture young clover, or the aftermath of meadows. If there is a heavy growth, moderate stocking may be allowed, but the droppings should be spread evenly.

Sundry Matters.—Harvesting machines should be oiled and put away without delay. Ditches should

be cleaned out, and the soil taken at once to the manure pile. Weeds should be cut everywhere, and if the seeds are ripe, they should be burned. Many loads of rubbish may be gathered from the roadsides and fences, for the compost heap. Fire wood should be cut and piled. Wood-lots should be cleaned up, and all work should be kept well ahead. It is no time now to be driven by work.

Work in the Horticultural Departments.

If the crops have been kept clean during the summer, the growth of weeds will now be very slight, and but little labor will be needed to destroy the few which now appear. September brings with its harvest time a season of planting, as there are numerous crops to be put in for next spring. The fall fairs should be visited, and if there are any held at accessible points, the farmer should exhibit his finest productions, both of fruit and vegetables; it will tend to keep up the interest of the society, and besides will be of great use to himself in bringing his products to notice. The local Farmers' Club or Grange ought not to be neglected, one evening a week can easily be spared for the discussion of varieties and modes of culture, manures, and gardening questions in general. A merchant studies the markets, and the different ways of putting up his wares, and a gardener should do the same, as his business will show at once the benefit or careful thought and good judgment bestowed upon it. A select library of good books, upon the different branches of horticulture, ought to be found in every gardener's house, as well as the most reliable journals.

Orchard and Nursery.

Drying Fruit.—Commence as soon as fully mature. If large quantities are to be preserved in this way, it will pay to get a fruit-drier of some kind, but as most private families only dry enough for home use, the common method is to employ the heat of the sun. Where there are hot-bed sashes, these may be used to great advantage. A frame raised a foot or so from the ground upon legs, and covered with sashes, will dry fruit and vegetables rapidly and cheaply. Make ventilating holes and cover with gauze.

Trees which were set in the spring, and now show signs of drying out, should have the soil around them removed to the depth of three or four inches, and then be thoroughly watered; afterwards replace the earth and apply a heavy mulch; this will often save them.

Seed-beds.—Shade the young plants, and keep weeded, as directed last month.

Marketing.—Carefully pick and assort all fruit sent to market. Never on any consideration shake or knock fruit from trees. Fall fruit should be marketed while firm and still fully developed.

Evergreens may be removed now as well as in the spring, if care is taken to preserve plenty of the earth around the roots. Never allow the roots to be exposed to the sun or air, and if a damp, cloudy day is selected, all the better, otherwise, water at planting.

Labels.—See that all trees and shrubs are provided with new labels where necessary. Do not, however, depend on labels entirely; a plan is easily made, and the position and name of each marked.

Seeds of peach and plum, from healthy trees, may be saved and preserved in boxes of sand for planting.

Plowing should be done as early as possible, and if new orchards are to be set, the plowing and manuring may be done at once. It is best to keep all young orchards plowed.

Nursery rows should be kept clear of weeds, with the hoe and cultivator.

Fruit Garden.

Blackberries.—Remove the fruiting canes after they have done bearing, and cut out all but three or four new canes, shortening these to five or six feet, and the side shoots to eighteen inches.

Raspberries.—Remove the old canes at once, if not already done, and tie up the new ones to stakes or wires. Fork in a good dressing of stable manure between the rows.

Currants.—Remove all suckers, and keep the ground clear of weeds.

Grapes promise to be an abundant crop this season, and plenty of boxes should be provided for marketing the fruit.

Pears.—Gather the early varieties as soon as fully matured, and when intended for home use, allow them to ripen upon shelves in the fruit-room; this will greatly increase their flavor and juiciness.

Strawberries started in pots may be set out during this month, but for general planting it is better to wait until spring. Cut off all runners where the plants are grown in hills.

Kitchen Garden.

Beans.—If there is a surplus of Limas, shell and dry for use next winter. The late string beans may be prepared as for cooking, and then packed in jars with alternate layers of salt.

Cabbages and Cauliflowers.—In order to have these early in the spring, sow the seeds in open ground about the middle of this month; the plants, as soon as large enough, are to be pricked out into cold-frames. Hoe the late crops often, and if the slug appears, dust with lime.

Corn.—As fast as the ears are gathered from the stalks, cut and feed to the cows. Do not feed the smutty ones. Dry a supply for winter use. A few ears of the earliest and best should be saved for seed. If care was taken to plant in succession, corn may be had until frost, or even later, if just before a frost comes, the stalks are cut up and set in a cool place; treated in this way, the ears will remain good for a week or ten days.

Cucumbers.—Go over the vines every day, and pick all that are of proper size for pickling. Sweet pickles and cucumber catsup, may be made of those too large for pickles.

Celery.—As soon as the nights begin to be cool, commence to earth up; this should be done only when the plant is dry, for if the leaves are wet, the probability is that the stalks will rust. Take care in earthing up, not to allow any particles of earth to enter the center of the plants.

Endive.—Blanch by covering with a board or mat, when the plants are a foot across; this will partially destroy the bitter taste which it otherwise has.

Kale.—The variety known as German Greens, is best for standing our winters; sow this month.

Manure.—Manure is both the beginning and ending of everything in the garden, and without it nothing can be accomplished, hence everything must be saved with great care, which will increase the quantity of this indispensable adjunct. Young weeds, sods, and many other little things which accumulate around the garden, will help swell the pile. Turn it over now and then, in order that it may be well rotted, and thus give a quicker return than when applied coarse.

Melons.—Turn the fruit so that it will ripen evenly; when fully ripe the stem parts readily. The fruit should be placed on ice an hour or two before eating; or else gather in the morning before the sun has heated the fruit.

Onions.—Harvest as soon as the tops fall down, dry a few days in the sun, and then store in a dry cool place.

Radi h.—Sow the Chinese Rose-colored and California White this month for winter use.

Spinach.—Sow the latter part of this month, in 15 inch drills, and keep clear of weeds.

Sweet Potatoes.—Move the vines occasionally to prevent their rooting at the joints; the larger tubers may be removed for use, and the small ones left to grow.

Squashes.—Remove the old vines of the summer sorts. Allow those of the winter varieties to root freely at the joints.

Tomatoes.—Tie up, and cut out all superfluous

branches. If the large green "worm" appears, destroy it at once, as a few will soon strip a vine.

Turnips.—Hoe Ruta-bagas, and sow the round early sorts at once, where there are any vacant spots.

Underdrains.—The present month is a good one in which to dig and lay drains, and any one who can afford it, will find by a few years' experience that it will pay.

Peat.—On many places there will be found low swampy lands, where there is plenty of peat, and where this can be had for composting with manure, it will pay to procure a lot for this purpose. This month is a good one for this work. It should be left to freeze for one winter, so that it will be fine and sweet.

Brush.—If there are any brush or large weeds in or around the garden, they should be cut and burned now, and the ashes applied to the land.

Flower Garden and Lawn.

If a good variety of annuals were planted, they will be making a fine show now. Asters, Balsams, double Zinnias, etc., make fine autumn bloomers.

Bulbs.—Set early next month all spring and early summer flowering bulbs. Order early, so that the dealer's stock will not be exhausted.

Chrysanthemums.—Pot a few plants for house flowering; set in the shade for a few days, thin out the weak shoots, and give a little manure water. The out-door plants will need tying up to stakes.

Dahlias.—Keep tied to stakes, and as soon as the flowers commence to fade, cut them off. Gladioluses require the same treatment.

Lawns.—Mow often to keep the annual weeds from flowering and seeding. Sow grass seed in any bare spots, so that it may have the benefit of the autumn rains.

Perennials and Biennials.—Sow seeds this month in well prepared beds, and keep well weeded.

Potted Plants.—Remove to the greenhouse or house, as soon as the nights begin to get cold. Wash the pots and remove all weeds, and see that no insects are taken in.

Seeds.—Gather as fast as they ripen, and before the wind has scattered them.

Greenhouse and Window Plants.

All repairs and alterations, both in the greenhouse and heating apparatus, ought to be completed this month, as a sudden frost is liable to require that many ornamental plants, which have been set out for the summer, should be taken in at once. Have ready a supply of coal, potting earth, and other articles needed during the winter.

Annuals.—Sow a few for winter flowering, especially Alyssum and Mignonette.

Bulbs.—Pot tender bulbs such as Oxalis, Cyclamen, and the like, the latter part of the month.

Callas.—Divide and re-pot in a rich turfy soil, which they particularly like.

Potting.—Commence potting tender plants which were bedded out during the summer, and also those which are to be used to propagate from.

Cuttings.—Put in cuttings of such plants as it is desirable to save.

Insects.—See that every plant is entirely cleared of insects, before putting into the greenhouse.

Pots.—Provide plenty of these for winter use of the sizes most needed.

Commercial Matters—Market Prices.

The following condensed, comprehensive tables, carefully prepared specially for the American Agriculturist, from our daily record during the year, show at a glance the transactions for the month ending Aug. 12th, 1874, and for the corresponding month last year:

Table with 5 columns: RECEIPTS, Flour, Wheat, Corn, Rye, Barley, Oats. Includes sub-headers for SALES and a final row for 25 d's last month.

Table 2: Comparison with same period at this time last year. Columns: RECEIPTS, Flour, Wheat, Corn, Rye, Barley, Oats. Rows for 28 days 1874 and 27 days 1873.

Table 3: Stock of grain in store at New York. Columns: Wheat, Corn, Rye, Barley, Oats, Malt. Rows for Aug 10, 1874, July 6, 1874, June 8, 1874, May 11, 1874, April 6, 1874, March 9, 1874, Feb. 9, 1874, Jan. 12, 1874, Dec. 10, 1873.

Table 4: Exports from New York, Jan. 1 to Aug. 10. Columns: Flour, Wheat, Corn, Rye, Barley, Oats, Peas. Rows for 1874, 1873, 1872, 1871, 1870, 1869, 1868.

Table 5: Receipts at head of tide-water at Albany each season to July 31st. Columns: Flour, Wheat, Corn, Rye, Barley, Oats. Rows for 1874, 1873, 1872, 1871, 1870.

CURRENT WHOLESALE PRICES.

Table of current wholesale prices for various commodities like Gold, Flour, Wheat, Corn, Rye, Barley, Oats, Beans, Peas, etc., with columns for July 11 and Aug. 12.

Gold has been up to 110 1/2 and down to 109—closing Aug. 12th at 109 1/2 as against 110 on July 11th. The Breadstuff trade has been quite active, but prices have been very much unsettled, largely by the unusually extensive speculative dealings in Corn and Oats, which carried values on these products up to high figures. The later transactions, however, were on a lower basis for Corn, Oats, and Rye, while Wheat and Wheat Flour closed more firmly. Oats have been very scarce, particularly old. The export inquiry for Wheat, Corn, and shipping grades of Flour, has been brisk at the current quotations. Provisions have been more sought after at generally higher prices. Pork and Lard have been pur-

chased freely on speculative account, at advanced figures, closing, however, quite depressed. ... Cotton has been in good request, but unsettled in price. ... A fairly active inquiry prevailed for Wool, at full rates, and a lively demand for Tobacco, the latter largely on speculation, at improved prices. ... Hops closed up more firmly, on a somewhat better trade and speculative call for supplies. ... Hay, Straw, and Seeds quiet.

New York Live-Stock Markets.

Beef Cattle.—The heavy receipts during the first week of the month were more than the market could bear, and at once reduced prices to the lowest rates of the previous month. As usual, the poorest grades of stock suffered most, and dealers were glad to realize without losing more than \$100 a carload. It was not that prices were too low here, but too high in the West; the expectation of a scarcity, which had led buyers to give high prices for their stock, proved illusive, and a surplus was met instead. A sudden falling off of over 4000 head in the next week, helped matters, and brought about a temporary recovery of ½ a cent, but this was soon lost, and the poverty of the stock brought in was a dead weight on the market, too great to be carried. To ship stock which sells here at \$25 to \$30 a head, is a waste of time and money, and the effect is to lower the tone of the whole market. Thus the market closed dull and irregular, with a wide range. Poor Texans sold for 6½@7c., and the best, which were not good, for 9½c. *q* *h*. Ordinary cattle sold from 11@12½c. *q* *h*., to dress 56 to 58 lbs. *q* *h*. Extra brought 12½@13c., to dress 58 lbs.

The prices for the past four weeks were as follows:

WEEK ENDING	Range.	Large Sales.	Aver.
July 20.....	7 @12½c.	10½@11c.	10½c.
July 27.....	8 @13c.	10½@11½c.	11c.
Aug. 3.....	8½@13c.	11 @11½c.	11½c.
Aug. 10.....	7 @13c.	10½@11½c.	11c.

Milk Cows.—There has been a moderate demand for cows, and only a fair supply. The market has been dull, and dealers have held off for full prices. At the close common to choice cows, and calf, were held at \$40@57½ a head. **Calves.**—The market for calves of all sorts has been steady and without change. At the close the demand is fair. 6½@9½c. *q* *h*. was paid for poor to prime milk-fed veals; 4@6c. *q* *h*. for buttermilk calves, and \$7@10 per head for grassers. **Sheep and Lambs.**—There is nothing to note in regard to sheep or lambs. The market closes with fair demand for good stock, but easy as to poor. Sheep were selling at 4½@6½c. *q* *h*. for poor to prime, and lambs at 6@8½c. *q* *h*. **Swine.**—There have been no live hogs offered for sale the past month. All have been consigned direct to slaughterers. Dressed hogs have been firm up to the close of the month, when they became weak and fell off a fraction, selling at 8½@9½c. *q* *h*., for rough grass-fed, and 8½@9c. for corn-fed. The arrivals for July were 98,616, with an average price of 9@9½c.; for the same month of the previous year the arrivals were 132,497, with an average price of 6½@7½c.

Recent Sales of Shorthorn Stock.

—The sale of the stock of Messrs. Hughes & Richardson, of Lexington, Ky., on July 22d, realized \$51,265 for 86 head, an average of \$730 each for 63 cows and heifers, and of \$228.26 for 23 bulls and 6 calves. The highest price was \$2,150 for a cow, "Lady Bates. Several yearling and younger hulls of good blood, were sold for \$75 to \$150. The joint sale of E. L. Davison, Wm. Warfield, J. G. Kinnard, and some other breeders, of 111 animals, held at the farm of Mr. Warfield, realized \$31,560, an average of \$306 for cows and heifers, and of \$170 for bulls of all ages. At the sale of Messrs. Leney's herd, at Wateringbury, England, 41 head were sold at an average of \$1,143 for cows and heifers, and \$336 for bulls. The highest price paid at the sale was for a calf, "4th Grand Duchess of Geneva" a grand daughter of the "7th Duchess of Geneva," which was bred by Mr. Sheldon, of Geneva, and was imported into England from the United States in 1867. The calf brought 2,000 guineas or \$10,400. At Messrs. Abram & Van Meter's sale, in Clark Co., Ky., 69 head were sold for \$36,830, an average of \$618.25 for females, and \$132.50 for bulls. At Warnock & McGibben's sale, July 28, 78 head brought \$35,690, average for females \$519.40, for bulls \$148.46. It is worthy of notice, that on the whole those animals sold, that were purchased at the New York Mills sale last year, brought prices in advance of their cost. It is safe to conclude from this fact that prices are still advancing.

containing a great variety of items, including many good hints and suggestions which we throw into smaller type and condensed form, for want of space elsewhere.

Remitting Money: — Checks on New York City Banks or Bankers are best for large sums: make payable to the order of Orange Judd Company. Post-Office Money Orders for \$50 or less, are cheap and safe also. When these are not obtainable, register letters, affixing stamps for postage and registry; put in the money and seal the letter in the presence of the postmaster, and take his receipt for it. Money sent in the above three methods is safe against loss.

N.B.—The New Postage Law.—On account of the new postal law, which requires pre-payment of postage by the publishers, after January 1st, 1875, each subscriber, whose subscription runs over into the next year, must remit, in addition to the regular rates, one cent for each month over which his subscription extends in 1875, or ten cents for the whole year 1875. Every subscriber, whether coming singly, or in clubs at club rates, will be particular to send to this office postage as above, that is, at the rate of ten cents for the year, additional to the regular subscription. Subscribers in British America will continue to send postage as heretofore, for pre-payment here.

Bound Copies of Volume Thirty-two are now ready. Price, \$2, at our office; or \$2.50 each, if sent by mail. Any of the last seventeen volumes (16 to 32) will also be forwarded at same price. Sets of numbers sent to our office will be neatly bound in our regular style, at 75 cents per vol. (50 cents extra, if returned by mail.) Missing numbers supplied at 12 cents each.

Our Western Office.—Our friends in the West are reminded that we have an office at Lakeside Building, Chicago, Ill., in charge of Mr. W. H. Busbey. Subscriptions to *American Agriculturist* are taken there, and sample copies of the paper and chromo are delivered, and orders received for advertising on the same terms as in New York. All our books are on sale at the Western Office. Please call and examine, buy, subscribe, and advertise.

Our Fair List.—We publish according to usage a list of the forthcoming fairs, which will be found upon pages 353 and 354. The Secretaries of the various societies have favored us with official announcements to a greater extent than usual, and in addition to the data thus given, others are taken from the numerous exchanges that come to our office. Every possible pains is taken to make the list as correct as possible. It sometimes happens that the date first fixed upon for holding a fair will be changed, either on account of the season, for the sake of not conflicting with some other fair, or for other reason. Several cases of this kind happened last year in which we were not informed of the change. Discrepancies produced by such causes it is impossible to avoid. We give the most reliable data we can find, and have no doubt that the present list will be found the most complete that has yet been published.

Cornell University has at length fully organized its College of Agriculture, as will be seen by our advertising columns. Several of the professors in this department are personally known to us, as men eminently proficient in their specialties. The University is located at Ithaca, a flourishing town in Central New York, in the midst of the most delightful scenery.

A Railway Gazetteer.—While a Railway Guide is useful for some purposes, it is very unsatisfactory if one wishes to know upon what line any particular town or village is situated. The "Gazetteer of Railway Stations," published by the National Railway Publication Co., Philadelphia, is a most useful little work, as it gives an alphabetical list of all the stations in the United States and Canada, showing what line they are upon, their population, and stating if they have telegraph and express offices. Besides this, there is Wells, Fargo & Co.'s Express Directory, showing how to reach all points in the Pacific and far Western States, together with much other useful information. Price, \$4.

The Death of John Staunton Gould occurred at his residence in Hudson, N. Y., on August 8th. He died of congestion of the lungs, and was

TO WIT:

Every Subscriber in September, 1874, to the *American Agriculturist* for 1875, (that is for Vol. XXXIV complete,) will be entered on our books at once, and receive the paper the rest of this year (3 months) without extra charge.

N. B.—This applies to all new Subscribers, whether singly at \$1.50 a year, or in clubs of four at \$1.25 each, or in clubs of ten at \$1.20 each, or in clubs of twenty or more at \$1 each. Ten cents extra must be sent with each subscription for pre-payment of postage for the year 1875.

Every Subscriber who remits an additional 25 cts., to pay for mounting, packing, and postage, will receive, pre-paid, the beautiful Chromo

"UP FOR REPAIRS."

The above offer will expire on September 30th. Let us hear from thousands who will take this Journal fifteen months for a year's price.

63 years of age. In early life Mr. Gould took an active part in politics, but for many years he has devoted himself to improved agriculture. As President of the N. Y. State Agricultural Society, and as lecturer on Mechanics as Applied to Agriculture, in Cornell University, he was thoroughly identified with agricultural pursuits. His genial manner made a favorable impression upon all who came in contact with him, and his cautiousness and careful judgment gave his opinions great weight. The State Society and Cornell University have lost a working member, and agriculture a most zealous promoter.

The Death of Henry Stephens, the author of the "Book of the Farm," took place at his residence, near Edinburgh, early in July last. He was in the 80th year of his age, and only three years before his death he completely revised and largely re-wrote his Book of the Farm, which is on all hands admitted to be the best practical work on British Agriculture, and which has furnished the materials for not a few English and some American writers on agriculture.

Perennial Phloxes.—These plants are gradually working their way into popular favor. There are now fine varieties from white to scarlet and crimson, but we have not seen so pure a white as is shown in the flowers of a seedling raised by Mr. White, of Jersey Heights, (Jersey City), N. J. The plant is very dwarf, truss large, and the flowers without any tinge of green. Mr. W. said he had no name for it, and we suggested White's White, which if it were pronounced "whitest white," would not be a misnomer.

Mr. F. R. Elliott has removed from Cleveland, O., to New York, office 53 Duane st., where he offers his services as landscape gardener and consulting horticulturist. While we have had occasion to differ from Mr. Elliott in some matters, we have never had any doubt as to his ability, and feel quite sure that from his long experience, he is capable of giving satisfaction to those who may wish his services.

Comfortable Country Chairs.—The chairs illustrated last month, page 305, were noticed on their own merits; we have since learned that they were made by A. E. Cooper, of Cooper's Plains, N. Y., whose catalogue shows that he makes a great variety of such wares.

The Submerged Pump.—Having occasion to put a pump into a well this spring, and finding that several neighbors, who were using the Submerged, gave a good account, we fixed upon this style of pump. It is very simple in construction, works easily, and answers admirably as a force-pump. The pump itself being under water it cannot possibly freeze, nor is there ever any annoyance from its getting dry. Thus far we are quite satisfied with its operation.

Weigh and Measure Everything.—Now that the season for selling has arrived, we would impress upon our readers the necessity for accurately weighing and measuring everything they sell. There is too much guess-work done. Buyers are handling produce every day of the year, and they weigh and measure all they handle. They are well posted. Farmers are not. When it comes to estimate the farmers are beat. "It is naught, it is naught, saith the buyer." And farmers are too easily persuaded by his pertinacity. Besides, farmers want the money and do not like to lose a sale. So they give way. There is no settler of disputes so stubborn as a good platform scale. A Fairbanks' scale will save many words, and much time and loss. Every barn should be provided with one, and nothing should be taken out for sale until it is weighed and plainly marked with its weight.

Butchers' Offal.—"D. B.," Champaign, Ill. Butchers' offal should be composted with earth in layers of a foot of each, and the pile well covered with earth. In this condition it should remain for a few weeks, when the pile may be turned over or mixed and spread at once, to be plowed lightly under the surface.

Crops in Kansas.—We have received from Alfred Gray, Topeka, Secretary of the State Board of Agriculture, a copy of the reports made by County Agricultural Societies, to the State Board of Agriculture of Kansas, of the acreage and condition of crops up to the first of July last. From these it appears that the acreage of almost every crop is considerably larger than last year, while the average condition is generally better than last year, wheat being the most remarkable exception. The value of these reports is greatly enhanced by their promptness, and if the State and local societies elsewhere, would emulate the example of the Kansas associations, and take pains to make correct reports, the

service to the farmers of the whole country would be of great value. Reports now of last year's crop, are about as useful as a last year's almanac. They are as plentiful as they are useless. These reports from Kansas are the first we have seen of the present crop, except general estimates not pretending to accuracy.

"Lump upon a Mare."—"J. G.," Preston Co., W. Va. A swelling upon the abdomen, near the udder, of a mare, which has recently foaled, may be due to several causes. It may be the result of inflammation of the udder, or what is known as "mammitis," or it may be caused by an injury in getting over a fence. In either case it would be safe to bathe it with cold water.

Lime upon Wheat.—"J. T. G.," Lafayette, Va. Lime is rarely used in less quantities than 15 to 40 bushels per acre. Any quantity that could be sown with a guano attachment to a drill would be too small an application to have any effect. One of the useful effects of lime is its mechanical operation upon the soil, and another is its chemical action upon the vegetable matter contained in the soil, and for either of these effects to be made apparent, at least 15 bushels per acre should be used.

Ice-Houses and Milk-Rooms.—The numerous inquiries for a connected ice-chamber and milk-room are not unnoticed. Press of other matter so far has forced their postponement.

Sowing Guano or Plaster.—"D. B.," Champaign, Ill. Guano or plaster may be sown broadcast by a Seymour's broadcast sower, which sows evenly from 25 pounds to 1,000 pounds per acre. It is disagreeable to sow either of these fertilizers by hand.

Application of Superphosphate.—"C. F. W.," Shufordville, N. Y. We have found the best method of applying superphosphate to the wheat crop to be to sow half the quantity, or 150 lbs. with the seed in the fall, and the other half in spring, as soon as growth commences. For spring crops it should be sown with the seed, and as near to it as possible.

Wistaria.—"A. M. P.," Norwich, N. Y. In localities too severe for the Wistaria, it should be laid upon the ground and covered with a few inches of earth. If it is necessary to do this, care should be taken in summer that the stems do not get so entangled with the trellis as to make removal difficult. If the Chinese is not hardy, why not grow the American?

Sunflowers.—"Alabama," we have not the slightest faith in the story that sunflowers will prevent "chills and fever." The leaves of this plant can do no more than any other foliage in purifying the air, and where this disease prevails, there is usually foliage in plenty. This sunflower matter is an old story. The latest thing is the Eucalyptus, or blue gum, which is said to be a sure cure. We have no more faith in this than in the sunflower, and singularly enough, its anti-malarious properties are not known in its native Australia.

Paris Green.—"J. H. F.," Monroe Co., Pa. Paris Green is not soluble in water, it is only suspended. It may be applied by a watering pot, stirring it as often as it settles, or by means of a whisk broom.

Seed Rye.—"H. C. M.," Roekland Co., N. Y. You can procure excellent seed rye of R. H. Allen & Co., 189 Water St., N. Y. It is grown by William Crozier, of Northport, Long Island.

Weed Named.—"Farmer," Westford, Vt. The specimens sent is the Rough Corn-flower, *Rudbeckia hirta*, a plant which a few years ago was rare in the Eastern States, but which is now unfortunately becoming too common. We know of no specific treatment for this or any other weeds, except good cultivation. One thing should be done at once—cut the tops and prevent its spreading by seed.

Rabbits.—"E. A. T.," Pa. We have not much faith in the profitableness of rabbits—that is, to sell as food. The wild rabbits, or hares, are offered in the markets at a very low price, and meet with but slow sale. We are not a rabbit-eating people.

Hydrangea.—"D. T. Ness. The flower of *Hydrangea Hortensia* frequently comes blue, like the specimen you send. Gardeners endeavor to produce this color by the use of peat, iron, and other applications, but it often appears without any special treatment.

Cider Mills.—"H. T. E.," Belleville, N. J. The price of a good portable cider mill, such as the "Keystone," or the "Buckeye," or some others, which

are to be found described in our advertising columns, is from \$10 up to \$40 or \$50, according to size. The cheapest is a size suitable for small orchards.

Iron Hurdles.—"T. G.," Kittrels, N. C. We do not know of any maker of iron hurdles. If there are any such, possibly your inquiry may attract the notice of the parties.

Virginia State Agricultural Society.—This association offers premiums of various values, from \$50 downward, for essays upon such practical subjects as the following: on the best management of a farm of 150 acres, devoted to mixed farming; separate essays for different districts requiring different treatment, being called for; on the best management of various crops; on grasses adapted to Virginia; on swine; on cattle, etc.; for the best experiments in the cultivation of various crops, and in the use of fertilizers. We could suggest only one addition to such an excellent list, which is a premium for the best managed and cultivated farm. To see and examine the best managed farm in any district, would be worth a world of written description.

SUNDRY HUMBUGS.—In former months we have had occasion to notice the fluctuating character of the "humbug business." At some seasons we are overrun with complaints of old and new schemes, and at loss to which to give prominence; then again there seems to be very little activity among the swindlers. The present is one of those seasons of quiet. These fellows find the greater number of their victims among the rural population, and they no doubt are aware that in hay and harvest time the farmer and his family are too busy to read their persuasive documents. So these schemers of all kinds during the summer keep very quiet. The successful ones, and some of them are very successful in money-making—especially the quack doctors—may be found at the watering places, cutting a dash with their splendid horses and costlier carriages, and vieing with the gamblers in making a vulgar display of diamonds.

WALL STREET.

Some chaps advertise that money invested by them in stocks and gold, pays 200 per cent a month, and strange to say, apparently sensible people believe this, and ask us if it will be safe to invest in the hands of the advertisers. Safe! bless your heart, yes, so safe that mortal eye will never see it again. One of these inquirers writes that he wishes to invest \$10—let him do so by all means, it will not be paying very dearly for a lesson. If this correspondent really thinks that any business which pays 200 per cent. monthly, needs to advertise for customers, he can afford to pay \$10 to be taught better. He says, "tell us all you know about the Bankers and Brokers of New-York city." We have had some funny requests in our day, but this is the funniest. Still we can reply briefly. There are bankers and brokers even in Wall street, who are men of the highest honor, and who would lose their right hand, before they would do a mean thing. This class do not hold out ridiculous inducements to their patrons. Then there are those who call themselves bankers and brokers, who will do anything to make a dollar, and we be to the man who gets into their hands. We do not claim to have an acquaintance with this style of brokers, but it comes in our way now and then, to know something of their operations. About a year ago a gentleman, who had in successful business in a Western city accumulated what he thought was a handsome competence, came to New York to live at his ease; he became interested in Wall-st., and thinking that he might as well increase his moderate fortune, placed his available means in the hands of one of these brokers. He was kept along with reports of enough successes, to encourage him, and the speculations continued all winter. When he came to square accounts with his broker, \$5 was all that he had left. Our friend turned his face westward, quite convinced that he had seen enough of Wall street. Now, if a man of fair business talent, and who, being upon the spot, could watch matters daily, fared so poorly, what sort of chance has one who lives at a distance, and knows nothing of the tricks of the street, if he puts his money in the hands of a curbstone-shyster? If one has money, be it only \$10, he is quite right in trying to invest that sum in such a manner as will increase it, but he may be quite sure that the way not to do it, is to trust it to the tender mercies of sharpers calling themselves brokers.... Complaints still come with regard to dealers in

CHEAP SEWING MACHINES.

We have said all that need be upon this subject. We repeat that there is no help, so far as we are aware, for those who have sent money, and received no returns. It is impossible for us to comply with the request of those who ask us to investigate their cases. We could not possibly give the time to the matter, even if it would do any good. The chaps need only say that no money had been received from the complaining party, and that would be

the end of it. The only machine of this make now most advertised, that we have seen, is a very funny affair, a very burlesque on machinery; the parties advertising are, or were a short time ago, in a very obscure upper room, without any sign to indicate their whereabouts. The look of the affair is suspicious, and the complaints that we have had are so numerous, that we feel it a duty to warn our readers against sending money to any unknown parties, who offer cheap sewing machines.

THE C. O. D. SUPPLY CO.

is still operating, apparently devoting itself especially to the Southern States. Let them alone, there is altogether too much machinery about it, and there is great danger that you will get your fingers pinched. . . . Our correspondent C. T. S., in West Va., can not have long been a reader of the *Agriculturist*, or he would not have asked us to get his prize from the

METROPOLITAN PRIZE ASSOCIATION.

We could not think of it. What these people want, is your \$7.50, and then you may get your \$250 melodeon—and then again you may not—probably not. Our correspondent evidently fears that he may run some risk in sending his money, so he writes to ask us to get his prize. No, we thank you. . . . Here is a correspondent in Tennessee, who asks us if our laws can not stop these Prize Associations. Certainly. We have laws enough, and upright judges, but laws do not put themselves in operation; there must be complaint and proof of wrong doing, in order to convict. On account of the fact that the victims of city swindlers reside at a distance, these evil-doers stand in little fear of the law. If one who lives in a distant State, merely asserts that he has been swindled by some one in New York, the law can do nothing. The only thing that has any effect upon these fraudulent schemes, is the exposure that the *Agriculturist* has given them these many years, and in which it has had but scant assistance from other papers. Were every paper, agricultural or otherwise, to refuse all doubtful advertisements, and to keep their readers warned against all suspicious schemes, the occupation of the whole horde of these swindlers would be at an end.

IN THE "MEDICAL" LINE.

The advertising dodges of these quack-medicine fellows are numerous, and some of them ingenious; thus there is one in Buffalo, who advertises that he will send a "prize-picture" free. "An ingenious gem, 50 objects to find." Many a hoy or girl will invest a stamp for the sake of getting a puzzle-picture—or a picture of any kind. In return they get a card with a very poor puzzle-picture upon one side, and upon the other side an advertisement of a book on sexual matters, which will be "sent secure, post-paid, for 10 cents." The hook is like all of its class, intended to work upon the imagination, and excite the fears of the young—and then it follows as a matter of course, that the only safety of the reader lies in placing himself in the hands of this wonderful Abbey, at \$10 per month. He is a high old fellow, this Abbey—as he says, "none living know my present remedy." What would become of the world, if this Abbey should die?—His precious pamphlet goes into our collection of curiosities. Don't take the road leading to that "Toll-Gate." . . . They get the news slowly out in Wisconsin, for here is one at this late day, who asks about

OLD MOTHER NOBLE.

It is so long since that we heard of the dear old "critter," that she had quite gone out of mind. Our correspondent can find "what we think of" Old Mother N. by consulting these columns for two years back, but a particularly touching account of *him* is given in December last. He was last known as Dr. Clark Johnson, Edwin Eastman, and the rest of her. . . . Then here is another from a Kentucky friend, who thinks we ought to expose

UNCLE BEN JO'S BELL-TONGUE SYRUP.

This is also an old affair. It seems a waste of good space to devote it to such shallow nonsense. We have already given all needed attention to this particular humbug. If there is any live mortal who can read, who will believe the statements put forth in this pamphlet, nothing that we can say will prevent him from being a victim. We are sorry for the "poor, susceptible farmers," hut what can we do other than to caution them against all such things. If a "subscriber to the *Agriculturist*" is, as you state, an agent for this quackery, we are sorry, but there is no knowing how much worse he might have done, had he not taken the *Agriculturist*.

INSTITUTES AND UNIVERSITIES.

We must again repeat what we have said so often, that there is no such thing, properly speaking, as the "N. Y. Medical University." One or more quacks choose to adopt this title, to aid the sale of their preposterous medicines. We suppose that the Attorney General of the State could prevent them from using this title, but he has not seen fit to do so. No proper medical college—there can be no such thing as "medical university"—ever makes or sells medicines, nor does any such institution

ever advertise cures. Colleges and universities are educational institutions, and not medicine shops. So with these so-called medical "Institutes," they are generally run by quacks of the most dangerous kind. The recent death of a young lady in one of these "Institutes" in New York, may lead to an overhauling of the whole crew.

THE OLD, OLD DODGE,

is now being played by one Daniel Adee. It is the "Preacher of the Gospel," or "retired missionary" dodge. D. A.'s oldest son gets dead-sick with consumption—something wonderful cured him, and the prescription can be had by addressing Dan—as aforesaid. It is so kind of Dan, to offer the prescription, and to generously pay for advertising that he will do so! One of our friends sent for the prescription, just to see if it was as we predicted. Dan Adee had a son restored by the "Indian Cough Plant," the same thing that cured the son of Dr. Brant, who was missionary to the Blackfoot Indians, and he learned all about it from a squaw! All you have to do is to get the stuff known to the "native Indians" (who ever saw any other?) as "Indian Cough Plant," steep it in water, and take it. But those poor, "miserable unfortunates," what don't have no correspondents among the Injuns with dark colored pedal extremities, can get the extract, for \$2 a bottle, from this dear benevolent "Minister of the Gospel"—or what is the same thing, Mr. D. Adee. Daniel, this is old unto staleness—it is malodorons. Step aside, and let

"DOCT." WHITE AND HIS CURATIVE SYRUP

come to the front. Now here is something worthy of the genius of Huyler, even the narrative of dear Eddie Eastman, thrilling as it is, is hardly so ingenious as the story of how White came by his Curative Syrup. We wish we had room for the whole, but can make only an abstract. The old man White having "educated" his son, sent him out with "large sums of money," to discover "hidden secrets relating to medicine." We shouldn't like to be a medical secret with White, Jr., after us, not much. He "did" the Indian tribes of this country, but nary a secret could he find. Then he went for the "wise men of the East," whoever they may be, and there he learned that the Jesuits received regularly from South America a medicine possessing wonderful properties, and that it came from Rio Janeiro. Nothing easier than for young White to "up and dust" and "git" for Rio. Here he learned that an "aged monk from the mountains" made regular shipments to "the Jesuits in the East." What was easier than for White to lay low for this monk, to follow him to his cave in the mountains. And then—ah White, it was a little mean—to get up into a tree and watch how the old fellow did it. And then he gives a picture of the monk's laboratory, which should convince the most sceptical. The monk was so indiscreet as to have his formula upon "a paper pasted on a board," and when he had stopped work for the night, what was easier than for White to copy off this paper "by the light of the moon"—in Latin at that—and to "git" once more. Rather hard on the monk, but the end justified the means. When he reached home, the senior White was just breathing his last, hut junior White, who had driven up in a "beautiful coach," with a "fine span of horses"—how touching all these little particulars are—soon put a stop to the old man's troubles, and cured him at once. If you don't believe it, there is a picture of the old man White reading the Bible; old mother W. sitting as straight as if she had swallowed a ram-rod; then young Doctor White—the chap who choused the monk out of his secret, and his wife—and, oh! the children—well the chap ought to make something out of his syrup, to find bread and shoes for all these little Whites—and so near of a size, too. Take this White's Curative Syrup thing altogether, it is a little the steepest piece of quackery we have seen in a long time. Somehow we can't help thinking that the hand which did Ned Eastman's narrative, had to do with this. Is it possible that this country can boast of two such?

THE COUNTERFEIT MONEY OR "QUEER"

business is duller than we have ever before known it. One P. A. Schneider, at Allentown, Pa., who claims to be agent for "the New York Co.," sends out about the richest specimen of a circular, that we have seen. Either this Schneider is an ignorant ass, or he assumes to be simple and stupid, with the hope that some who think themselves smart, will catch at the bait. We incline to the last view of the case. Here is a specimen of his circular: "I have no counterfeit money. I have rail jimine goods money I was 10. years in the United State printing Office in that tim I did slib a few blades, and now I make my own goods in my own printing office—if you dond trust me then Come in Town & C ME."—That, Mr. Schneider, is just "a little too thin."

A Monstrous *Lilium auratum*.—The "monstrous" forms of the common Japan lily (*L. speciosum*) are well known, as the habit has become so fixed, that bulbs producing monstrous stems are offered

for sale. We never saw a monstrous Gold-handed Lily (*L. auratum*) until Messrs. J. M. Thorburn & Co., recently sent us a specimen. In this, as in the others, the stem is several inches broad, and flattened as if what should be several stems, were soldered together, and the upper portion of it is clothed with flowers as closely as can be packed. By counting a portion, we estimate that this stem produced considerably over a hundred medium sized blooms, and is altogether one of the most wonderful specimens of floral abundance that we have seen.

The Colorado Potato Beetle in

New Jersey.—Just as we go to press, there comes the startling announcement that the dreadful "potato bug," has at last made its way to the coast. It has been found near Elizabeth, and in the Saddle River township, N. J. Coming so late in the season, it can do but little damage to the present crop, but next year farmers will have work to do. Let New Jersey look out!

Eastman's Business College.

—This establishment, which not many years ago began in a ridiculously small way, now has some 1600 students, 60 instructors, and occupies several large buildings in the beautiful city of Poughkeepsie, N. Y. A directory, giving the present residence and occupation of the graduates of this college, shows that the young men are making their way in the world. Circulars can be had by addressing the President, H. G. Eastman, Poughkeepsie, N. Y.

New Raspberries.

—Several new raspberries have been brought this season for our inspection. The only one of these of any promise, was a variety brought by Mr. Saunderson, of Staten Island, which had excellent qualities for a market berry, it being of good size, bright color, and, what is of most importance, great firmness.

Wild Carrots.

—"J. L. W.," Thomasville, N. C. It is true that the Wild Carrot does not spread by the root, but it produces an abundance of seed to continue the crop. The plant should not be allowed to perfect its seed.

Spreading Lime.

—"H. H. F.," Lavansville, Pa. Lime can not be spread as it comes from the kiln, it must first be slacked. Then the easiest and cheapest method is to spread it with long handled shovels either direct from the heaps, or from the box of a low sled.

Blackberries.

—"J. B. D." says: "On p. 283, speaking of the cultivation of blackberries, you direct the new canes to be pinched off at the height of five or six feet. Having tried various heights, I have found that my berries are largest and most abundant when the canes are cut back to within three or four feet of the ground."—Our correspondent does not say what varieties he has kept at this height. In restricting the plants in this manner, we should fear that they might be forced into flower unseasonably.

The White Willow.

—"L. L.," Hutchinson, Kansas. The white willow is almost universally well spoken of through the West, as a rapid grower, and a useful tree, both for shelter and for hedges. A great many persons are planting it, and we have seen trees from cuttings, planted three years ago, which were three inches thick, and fifteen feet high. Those trees may be cut this year, or next, for fence-poles. There are also many willow hedges planted, and if they are not all that may be desired, yet they grow quickly, and make a good wind-break; when three or four inches thick they may be lopped off at four feet from the ground, to furnish poles for rails. The cuttings should be thicker and larger than usually planted. An inch in diameter at least and four feet long, is a good size. They should be set a foot apart, and eighteen inches deep.

Onion Grub.

—J. B. Duffey, N. J., writes: "Three times in my somewhat limited experience I have been visited by the onion grub, the ravages of which, on each occasion, threatened the entire destruction of my beds. It was suggested to me to use soot, sprinkling it along the rows. I did so, and the effect was almost magical. My onions immediately ceased wilting, and an examination of the plants a day or two after the application showed no trace of the grub. The remedy never failed me, and besides, it acted as a vigorous fertilizer to the crop."

Wheat and Guano Drill.

—"P. N.," Clinton Co., Ill. All the drills made for sowing grain have attachments for sowing fine fertilizers along with the seed. But there is no drill made that sows lime in such a manner. Lime always contains hard lumps, which render such a method of sowing impracticable.

Stopping Leaks in a Roof.—Montclair. When a shingle roof becomes worn and leaky, the cheapest plan in the end is to have a new roof. There are a variety of roof paints which will make a temporary repair, but the contraction and expansion by heat and moisture, will soon open the cracks again, and the roof will be as leaky as before it was painted.

Spaying Heifers or Cows.—"R. M." Both heifers and cows are sometimes spayed. The former are thus made to grow to a larger size for beef, and the latter are made to give milk for several years without intermission. Spaying cows is useful, when milk is desired regularly, in places where bulls are not kept, as in cities. The operation should be performed by a veterinary surgeon. It can not be done safely by a person who knows it only from books.

Leaky Cisterns.—"S. H. H.," Tioga Co., N. Y. There is no help for a cistern, at the bottom of which there is a spring of water. The water will break through in spite of all one can do, in most cases if not in all. We would abandon such a cistern rather than be bothered with it, and try another place.

Fodder Crops for the South.—Alabama. Cat-tail millet is one of the many varieties of what is known as Hungarian grass (*Setaria Germanica*, botanically). It is an excellent fodder crop for the South. The Southern pea is a good fodder crop. Oats and rye may be sown for winter feed. Barley and vetches sown together are also an excellent fodder crop. With these and corn, beets, cabbage, and rape, a succession of fodder crops might be had throughout the season.

Irrigating Corn or Cotton.—Alabama. It would undoubtedly pay to water both corn and cotton during drouths, if the water can be procured without expense. But it is useless to water crops during the day time, and under a hot sun. The water should be applied during the evening or in the night. The cheapest method would be to turn the water from a stream directly into furrows between the rows if this is possible. Watering by means of sprinklers upon wheels, might be used while the crop is small, but it would be slow and costly. If a width of 6 feet is watered at one passage through the rows, every mile travelled would water three quarters of an acre. It is a question altogether of the cost of procuring the water.

A Gorged Cow.—"J. H. F.," Canadensis, Pa. When a cow has been carelessly allowed to gorge herself with dry meal, the safest remedy is to withhold water, except in small quantities, to give a pint of linseed oil, by the mouth, and injections of soap and water, until the bowels are evacuated. No food should be given until the stomach and bowels are freed.

The American Poultry Pedigree Book.—We have a sample sheet of the forthcoming "American Pedigree Poultry Book." We have already expressed our opinion of this book. The "American Swine Herd-book," failed to become a fact, from its obvious impossibility. But a poultry pedigree book is more impossible still, if we may use such a term; it is an absurdity that we could hardly suppose would be entertained. To what vast proportions it must arrive in two or three years, if it is generally used; and if it is not generally used, it becomes worthless. The impossibility of identifying any bird, and the confusion which exists from the beginning, will certainly lead to frauds which cannot be detected, and there will be no confidence in it. And then there will be complaining and trouble.

Clipping the Toes of a Cow.—"R. M.," Salt Lake City. When the hoof of a cow, ox, or sheep, grows too long at the toe, it may be shortened by taking a pair of strong pincers, such as are used by blacksmiths for horse-shoeing, grinding the edges sharp, and cutting away the toes, until they are reduced to a proper shape. Or a strong paring knife may be used if handled with care, but it is not nearly so safe as the pincers. Animals with feet too long at the toe, should be attended to at once, or lameness may result.

To Raise a Spring.—"T. L.," Gadsden, Ala. It would not answer to build a wall around a spring, in the hope to raise it 12 feet. The water would break out somewhere else. The best plan perhaps would be to put in a hydraulic ram.

Selecting Eggs for Pullets.—A correspondent sends us a slip, containing an article from an English paper upon this subject. It is stated that the position of the air-bubble in the egg will determine the sex of the chicken. There are four illustrations of the forus of the eggs, and the positions of the air-bubble.

Two of them we have studied and compared together. One of these is said to show the kind of egg that "will hatch a lively cockerel," and the other "will hatch a pullet." This is definite; but unfortunately, on comparing the engravings, the shapes of the eggs, and the positions of the air-bubble are exactly the same in both. A similar result has occurred in every case, in which we have closely investigated the statements of those who have pretended to know more of this thing than any other man. The fact is, as yet this question of sex is undetermined, and a long series of observations, scientifically conducted, are needed, instead of vague surmises, and haphazard conclusions, before we can safely determine anything about it.

Permanent Grass.—"J. W. C.," Rockford, Ill. There is no more unanswerable proof that permanent meadows may be established in our climate, than the prairies which have been broken up and changed into corn-fields. For ages these prairies have produced grass, and have supported millions of animals which have grazed upon them, and yet they have increased in fertility during all those years, so that since those ancient pastures have been plowed, they have borne repeated crops of grain year after year. What has been may again be. It is a great benefit to a farm to have a portion of it in permanent grass, and every new prairie farm opened, should have at least one-third of the area reserved from the plow, for pasture only.

Bone-Dust for Wheat.—"A. P.," Peppertown, Ind. We would rather use Peruvian guano for a wheat crop than bone-dust. The bone-dust is only very slowly soluble, and there would be very little effect. 150 to 200 lbs. guano per acre, on the contrary, would have a very good effect upon the wheat. It should be sown with the wheat in the drill, or broadcast, and harrowed in along with the wheat.

Sweet Potatoes for Feed.—"J. M. D.," Pierce Co., Ga. We have never fed sweet potatoes to stock, but should expect them to be more valuable than round potatoes, turnips, or beets.

To Dispose of Straw, Shucks, and Cobs.—"B. F. B.," Uvaldy Co., Texas. We can suggest no way of making up these matters into manure, but by penning cattle upon them; unless it be by scattering them upon the ground, and plowing them under the surface. The latter will probably be the easiest and cheapest method. It is better than not using them at all or burning them.

Bloody Milk.—"Subscriber," Orlando, Ind. Bloody milk is generally caused by a congested state of the lacteal vessels, through which the red coloring matter of the blood, which is called *hematin*, escapes into the milk. Cooling food should be given, and a strong dose of epsom salts, (12 to 16 ounces). The udder should be bathed in cold water freely several times a day.

As to Draining.—"G. G.," Greenville, Ill. Before so costly a work as underdraining a farm is undertaken, it would be well to count the cost. It is well worth the small sum of \$1.50, to have the means of doing this. "Waring's Draining for Profit and Health," can be had for this price, and will give all necessary information as to cost and mode of doing the work.

Top-dressing Meadows.—"W. W. S.," Dutchess Co., N. Y. There is no better season for top-dressing meadows than the present month. Anything in the shape of manure or fertilizers is better than nothing. Well rotted fine manure is the best application that can be made. Next to that is coarse fresh manure, decomposed woods' earth, rotten chip dirt, tanner's waste, or sweepings of village streets. Where refuse from woolen factories, slaughter houses, or city waste of all kinds can be procured, these should be composted with earth from the roadsides, or bottoms of ditches, and lime or wood ashes, and after remaining a month in the heap, they may be spread upon the grass. It is well to harrow up bare spots, and sow some more grass seed upon them. The earlier this can be done the better for the meadow, as the heavier coating of fall growth that can be procured, the safer it will be from injury by frost. Meadows should not be closely pastured at this season.

Charleston Superphosphate.—"J. M. D.," Blackshaw, Ga. The prepared Charleston phosphates will be valuable for cabbages and turnips. These crops are specially improved by manures containing phosphoric acid.

Cutting Corn for Fodder.—"C. T. S.," Nissequogue, L. I. It is possible to cut up corn-

stalks with the ears for fodder. We have done so with a large-sized "Telegraph Fodder-Cutter," run by a two-horse tread-power, as fast as one man could feed the corn. Such fodder, however, should either be steamed or ground in a "Little Giant" mill—an ordinary bark mill would answer the purpose very well—to prevent much of the corn passing away whole and undigested.

Sugar from Beets.—"A Reader." The manufacture of sugar from beets needs some delicate chemical processes to get rid of the salts, which interfere with the extraction of the sugar. It is this difficulty which has hitherto caused many failures in beet sugar making, and in a small way it would prohibit the domestic manufacture altogether. For sweets for home use, that can be produced upon the farm, there is nothing better than syrup from sorghum. This can be made in a small way as easily as maple sugar.

Breaking Hedge Rows.—"H. E. Van D.," Geneva, Kansas, recommends hedge rows to be broken in June if possible, but not later than July 15th. The rows he broke in August, 1873, were so tough the past spring that the hedge could not be planted. The rows should also be 12 feet wide in place of 6 feet.

Sweet Potatoes.—"W. H. L.," Moberly, Mo. In all Northern localities sweet potatoes require artificial heat to carry them safely through the winter. They should not be exposed to a temperature below 60°, and those who grow them in large quantities have a house for the purpose, in which a fire may be built whenever necessary. Small lots can be kept in a box or barrel in the kitchen, or other warm room; we have known them to keep in an unusually warm and dry cellar.

Garden Questions.—"H. S.," Brandon, Wis. It will not do good, but hurt, to take away the leaves of cabbages and cauliflowers while they are growing. It is not essential for the forming of cauliflower heads to draw the leaves over the head, but it is well to break down a few leaves when the head is forming, to keep the sun from it. Do not understand your question about "top seed" onions; the other is answered in an article on p. 341. Salsify, or vegetable oyster, will sometimes bloom, as will other root crops, the first year from seed, but the seed from such plants should never be saved.

Seed Wheat.—"B. L.," Clinton Co., Ohio. It is questionable if it would pay to purchase seed wheat from a distance, at double the ordinary market price or even less than that, unless in a very small quantity and for an experiment. It is not safe to risk one's whole crop, by changing the seed without knowing exactly what you are doing. The finer white wheats require richer soil than the hardier red wheats, and the difference in the market price will not warrant paying much higher for the seed. It is not so much to the seed as to the land, that we are to look for better crops, and by selecting a good sample of ordinary wheat free from weeds, at a few cents above the market price, one may do better than by paying a double or treble price for other seed, the only merit of which may be that it comes from a distance and costs so much. Clean selected seed is worth 25 cents a bushel above the usual market price of the same variety.

Wheat on Corn Stubble.—"W. W.," Millin, Ohio. There are times and places in which sowing winter wheat upon an unplowed corn stubble may be not only permissible, but proper, as the best thing that can be done. The solid bed thus gained for the seed is often an advantage, as is also the time saved. But where the chinch-bug prevails, all the loose corn stubs should be gathered up and burned, as it is in these and other rubbish that this pest harbors and is sheltered through the winter. The clearing up of such rubbish every fall should be done for the purpose of destroying injurious insects, which would prey upon the coming crop.

Cheese Factory at South Bend, Ind.—"W. R.," South Bend, Ind. Factory men are averse to investing their capital in new places, unless under such guarantees that they will be independent of any adverse action by their patrons at any time in the future. Cases have happened in which, after a factory has been built, those supplying milk have professed to be disappointed, and have withheld the milk, leaving the owner of the factory "in a fix." The best plan is for the owners of the cows to subscribe the money and build the factory, and lease it to the factory man. For 400 cows a sum of about \$7 per cow would put up the factory and furnish it. But before it is built, it would be wise to have a competent person to examine the locality, and advise as to the propriety of building the factory. L. B. Arnold, of Rochester, or Gardiner B. Weeks, of Utica, N. Y., would give trustworthy advice upon this point.

Hereford Cattle.—"J. C. E.," Milton, Ohio. The Herefords are the next best beef cattle to the Shorthorns. They are probably superior to these in some districts. They are, however, at present unfashionable, but the time may not be far distant when these or some other race may overshadow the now favorite Shorthorns, just as the Shorthorns displaced the once favorite Longhorns. The Herefords are a pure breed of large bodied white-faced cattle, reddish-brown in color otherwise, which are excellent feeders, with good constitutions, and fine beef producers. They will doubtless be exhibited at your State Fair, and will be found worthy of examination.

Safe Emasculation.—"A. T. J.," South Bend, Ind. If the cut in the scrotum is made low down, so that any pus that is formed can escape, the operation of castrating is made much safer than if the cut is made higher up. The great danger is from inflammation, the closing of the wound and the formation of pus, which can not escape and is absorbed into the system, poisoning the blood. If the wound is kept open until healed within, the only serious danger is prevented.

How to Recognize a Goose.—"W. N.," Lexington, Ky. It is difficult to distinguish a goose from a gander by external marks without close study. After long acquaintance with the flock, the recognition is very easy. The voice of the gander is harsher and more discordant than that of the goose, the head is coarser, and the bill stouter and heavier, the neck is longer and thicker, and the breast less prominent. Generally the gander is the first aggressor in those demonstrations which a flock of geese delight to make upon strangers. The gander is always on the lookout, and if one in a flock is on the alert, while the rest are feeding, it is almost certain to be a gander.

Harvest Home Celebration.—The Rantoul (Ill.) Association of Patrons of Husbandry held its first harvest home picnic on August 1st in a grove near that town. It was largely attended, and many members of other Granges and industrial associations joined the celebration. There were bands of music, a collation, and speeches, and the experiment was very successful.

Tree Planting in Nebraska.—The Burlington and Missouri Railroad Company has planted along its line of road in Nebraska, for a distance of 120 miles, 500,000 trees. The smallest loss of trees was amongst the ash, of which 98½ per cent lived; of box elder and honey locust, 92 per cent lived; of soft maple 83 per cent; European larch, 82½ per cent; Scotch and Norway pines, 80 per cent; and of several species of willows, 75 to 72 per cent lived.

Small or Large Cobs.—"J. W. J.," Lewis Co., Ky. It is working the wrong way to attempt to reduce the size of the cob in field corn. If the cob could be reduced in size to one inch in diameter by selection of seed for a series of years, the product of the crop must certainly be greatly reduced at the same time. A cob two inches in diameter has double the space to be filled with grain that one half that size has. The effort should be to enlarge the size of the cob in thickness and length, and to increase the length and number of the grains at the same time. There is no doubt that much may be done in this way by selecting for seed those ears which have the largest number of rows and the greatest length, and planting the seed remote from other corn.

Grain Binders.—An automatic binding attachment to a reaper is a very desirable thing to possess. Hitherto the attempts that have been made to effect the binding of the sheaves by machinery attached to the reaper have not been successful. Final success, however, will be attained before long, if it has not already been secured. A binder made by W. A. Woods, of Hoosic Falls, N. Y., was tried recently with success. The sheaves were well bound, without any failures. Another binder, made by N. B. Fassett, has been tried in Iowa. This machine also worked satisfactorily.

Rather Mixed.—A semi-weekly newspaper, with an agricultural department, published in a Western city, states that "land-plaster or guano is the production of a number of rocky islands in the south sea." Also that "a species of land-plaster, which is a deposit of bone-phosphate, is found in South Carolina and Georgia." Then a "Rural" paper, in correcting this statement in describing "plaster," says "that it is not a fertilizer in itself, but absorbs fertilizing properties from the atmosphere;" and further, that "years ago it used to be the practice to roast the rocks, in order to reduce them to powder more easily, and such may yet be the practice where facilities for grinding are not at hand; or where the

rock is impure from hard strata contained in it." How little then must he know about this simple substance, the uses of which for fertilizing purposes and for plastering walls of houses are so mixed together. Burned gypsum is plaster, which, when mixed with water, sets as hard as a stone, and could not in any case be used as a fertilizer. And now a paper, which has "Farmer" for part of its title, recommends grass and turnips to be grown together, and thus raise a double crop.

To Keep Plows Free from Rust.

—"A boy of fourteen," or any other person, does wrong to allow his plows to become so rusty that great labor is required to scour them. There is no help for it in that case, but to scour with a piece of brick and sand and water, until the mould-board is bright. But if, when the plow is done with, the mould-board is covered with thick lime-wash, or a good coating of tallow, and put away in a dry place under cover, there will be no need to spend a whole day in scouring it when it is wanted for use again.

What is a Car Load.

—"R. A.," Ripon, Wis. Generally a car load is ten tons. Specified articles are taken on most railroads in the following quantities as "car loads" viz: salt or lime, 70 bbls; flour, 90 bbls, or 200 sacks; soft wood, 6 cords; cattle, 18 to 20 head; hogs, 50 to 60; sheep, 80 to 100; lumber, 9,000 ft. dry, or 7,000 ft. of green; 17,000 feet of dry siding; 13,000 feet of dry flooring, dressed; 40,000 shingles; wheat 340, corn 300, oats 680, and of barley 400 bushels. Potatoes, bran, feed, and other produce is taken by weight.

Procuring Loans.

—"R. Van D.," Peoria, Ill. Evils always remedy themselves in course of time. The facility of getting loans upon mortgage of Western farms from Eastern capitalists at 10 or 12 per cent. per annum, has been an evil by which the Western farmer has suffered. It has led to loose expenditures and extravagance, and has fastened a load of debt upon the West, which is a dead weight upon its real prosperity. Now Eastern men fear that their debtors might strive to free themselves, by adverse legislation, making foreclosure of their farms difficult or impossible, from their encumbrances, and they have stopped loaning money. We do not know where you could borrow money in any Eastern city, nor would we advise you to try to do it. Borrowing is a bad practice, and only puts off the evil day. The best plank in the Granges' platform is "pay as you go," and your best plan is to become a Patron and hang on to this plank.

Cattle in the South.

—"J. W. J.," Atlanta, Ga. The safest plan to procure hardy improved cattle in the South, would probably be to introduce thoroughbred bulls, a year old, in October or November, from the North, and use them upon the best native cows. If the bull can not stand the change of climate, he will leave some half-bred calves, which might be bred to another young bull. In time a greatly improved stock of thoroughly acclimated cattle would be secured. But there is no reason why cattle from the North should not be acclimated gradually, if care is used. The hot sun in the day-time is not more hurtful than the heavy dews at night, and stock should be protected from both of these. The fall is the proper season for bringing in stock, which then have a whole winter in which to get acclimated. Shelter, fresh feed, and good water, are the requisites for safety.

Treatment of Parrots.

—"An old Subscriber," informs the "Indiana Correspondent," that the proper treatment of parrots consists mainly in giving fresh water every day, proper food with regularity, and keeping the cage clean. Brass wire cages should be avoided. The floor of the cage should be cleaned out every day, and covered with fresh coarse sand and gravel. The perch should be cleaned at the same time. This should be thicker in the middle than at the ends, that the feet may be eased and rested at every change of position. This prevents diseased feet. A deep dish of tepid water should be given each day, to bathe in. Bread and milk should be staple food; the bread should be stale and be soaked in warm water first, and then drained on a cloth, dipped into scalding milk and fed when cold; the bread should not be mashed or soaked until soppy. It should never be given when sour, nor should the feed pan be allowed to become sour. Beech nuts, hickory nuts, walnuts, sweet almonds, crackers without caraway seed, boiled sweet corn, and pieces of sweet apple freed from the skin, are all good if given in moderate quantities. Flesh should never be given, as it engenders a vicious appetite, and causes them to pull and eat their own feathers. Parrots are natives of tropical climates, and need warmth. But they should not be hung up in the foul heated air of a close room—warmed by a hot stove in the winter season—during the day, nor

be left to freeze without fire during cold nights. It is better to place the cage upon a low stand, where the air is pure and moderately warm, in the day, and wrap a blanket around the cage at night. When sick a teaspoonful of hemp seed with a pepper corn or two, should be given every day. Water cress when it can be procured is a good alternative; but these birds are rarely sick, except when they are fed with sugar and other improper food, or when they are neglected.

Low Freights on Grain.

—The current freight on wheat from Chicago to New York is now only 11½ cents per bushel, made up as follows: from Chicago to Buffalo, by steamer 2½c., elevating at Buffalo, ½c., rail from Buffalo to New York, 8c. The tolls on the Erie canal are now 3¼c. a bushel more than the whole freight from Chicago to Buffalo. The cost of handling grain in New York is 3 cents, and the freight to Liverpool is about 14 cents. The cost of carriage from Chicago to Liverpool is therefore less than 28½ cents a bushel. That this is solely due to natural causes, and not in the least to the influence of any combination of farmers, shippers, or carriers, is one of those facts that prove what we have frequently stated, viz., that the prices of all commodities or services are regulated not by laws or combinations of any parties interested, but are the natural effects of supply and demand. Just now there are many unemployed ships upon the lakes, and business generally is dull, hence these unexampled low freights. It is, however, not a healthy condition of things, nor a desirable or profitable one for farmers themselves, when important industrial interests work without profit. And just now the farmer gains no benefit from these low rates, but it goes to those who consume the wheat and flour which he raises. It is fortunate that it does this, for at present there is no laborer so undervalued, or who finds work with such difficulty, as the artisan in the workshops, or the laborer about the streets of towns and cities.

"Walks and Talks" Correspondence.

SELLING THE FARM.—A widow, with three children, who has a farm of 120 acres in Illinois, worth \$75 per acre, writes me that she has carried on the farm for three years, since her husband's death, and has made a fair living, but she and her children have to work very hard. Her friends advise her to sell and put the money on interest. I can give no opinion. It depends somewhat how old the children are, and whether she wishes to keep the farm for them. She gets many things from the farm that she would have to buy if she goes to a village or city. And she now pays no house rent. It is not always easy to sell a farm when you wish. I would go on farming as though I intended to keep the farm, and yet, if an opportunity occurred to sell at its full value, sell, and perhaps buy a smaller farm near a village, where manure and labor can be obtained. Then go into the raising of such crops as require more careful supervision and less hard labor. A woman probably can not compete with the men in raising corn. But she may beat them in raising thoroughbred stock, or in small fruits, or garden stuff. Much will depend on the boys. Every year they will be better able to help.

RAISING CORN.—F. K. Adams, Delafield, Wis., writes me that he breaks up his sod land for corn 4 inches deep. After corn, oats. Then beans, and then spring wheat. The wheat being, I suppose, seeded down. For wheat he plows 8 inches deep. Four inch plowing for corn, and eight inches for wheat, he says, is "not orthodox, but gives me the best results." He cultivates his corn twice, going twice in a row, using a two-horse walking cultivator, and stirring the land six inches deep. As I understand the matter, he cultivates deeper than he plows. Prof. Roberts, of Cornell University, was on my farm a short time ago. He thought I ought to get a two-horse Western corn cultivator, and plow up the land between the rows of corn five or six inches deep. I think one or two such plowings between the rows of corn, early in the season, before the roots have full possession of the soil, would be beneficial, but afterwards I should want to keep down the weeds, and mellow the surface with a shallower cultivator, and one which could be run close to the corn. I am willing to admit, however, that Western farmers can teach us how to raise corn. Mr. Adams says he finds that sod plowed in the fall, and manured in the spring with well rotted manure, and worked in with the cultivator, is best for corn.

DITCHING.—"E. J.," Iowa, asks me in regard to a ditching machine for draining sloughs. I think he will find a sharp spade and a man who knows how to handle it the cheapest and best machine. The tough sod on top may be removed by throwing out a couple of wide, deep furrows. The black mucky soil underneath ought to be easy digging. Get some narrow underdraining spades and a long handled scoop. Keep them ground sharp

and bright. Cut the drain no wider than is necessary for the tiles. In such land, a drain two and a half to three feet deep, 14 inches wide at top and 3 inches at bottom, ought to be cut for from 15 to 20 cents a rod.

ABOUT MUCK.—"W. M." asks if "muck, in conjunction with commercial manures, such as superphosphate, nitrate of soda, etc., would come anywhere near the standard of stable manure as a fertilizer for exhausted land."—I do not think there would be anything gained by mixing superphosphate or nitrate of soda with muck. If you have muck on the farm, or near by, throw it up in the summer to dry. When dry, it can be used in a variety of ways as most convenient—1st, it can be made into a compost with lime or unleached ashes; or (2nd) it can be composted with stable manure; or (3d) it can be drawn at once directly to the field, and spread as top-dressing on grass land. A good superphosphate is a capital manure for turnips. I do not think it will pay on wheat. For barley nitrate of soda and superphosphate, at the rate of 200 lbs. each per acre, will probably pay. The muck will be a slow and lasting manure. The commercial manures we should aim to use only on crops that will pay for their use the first year.

DRAINING A POND.—"W. H.," Kansas, says there is a pond of about three acres on the farm that he proposes to drain. It receives the surface water of about 100 acres. He will dig a drain to the river, about 50 yards long. The bottom of the drain will be loose black soil. He can not get tiles, and asks how he had better make a stone drain. I think I would make a board drain, by nailing, say 6x7 inch boards together A shape. This would be cheaper than a stone drain, and not so likely to sink in the loose earth. But would it not be better to simply make an open ditch for a year or two, until you see how it is going to work, and how large a drain will be required to carry off the water?

Bee Notes.

BY M. QUINBY.

If we compare the amount of honey delivered in New York market 15 years ago with what it is now, we shall find that the present quantity exceeds the former by one half. In the counties in Central New York—perhaps all the counties in this and other States—there are now probably not more than one-fifth the number of bees there were at the time mentioned. We can not explain all the causes that led to these results, but some of them are evident. The bees that are left in the country must be managed differently from what they then were, or the honey would decrease proportionally. Most of the bees left are in the hands of the improved culturists, who supply the market. Consumers are indebted to improvement for their supply. As there is one thousand times as much honey produced in the flowers as is collected, and which must be wasted, of course it is evident that we ought to do all we can to encourage the cultivation of bees by observation and experiment, and by adopting the management of the most successful bee-keepers.

I visited such an one about July 1st; arrived at 4 P. M., and as he was absent, I had an opportunity of inspecting the premises. The house between the bees and street, was on the west side; that and the trees protected them from prevailing winds. The grounds were smooth, and descending just enough to drain off the surface water. On the north side was a close ordinary board fence, two feet from which stood a row of hives, twenty-five in number, six feet apart. Fifteen feet in front was another row, and the same distance apart. There were three rows, all perfectly straight, each hive like every other; each of all—boxes, frames, and combs—was like every other part. The hives were painted four different colors, none of them very dark. Different colors alternated, so that three different colors were between every two of one color. The first time a bee leaves a hive—like a sensible person—it marks its locality to guide its return, and thus avoid entering the wrong hive. When hives are all nearly alike and of one color, they should be set irregularly, and face in different directions.

Five of his hives had swarmed out the day I arrived; all of the swarms had returned after flying a few minutes. Had the hives been close together, and of one color, they might easily have gone into a wrong hive. The queen, unable to fly, moved only a few feet from the hive, and crept back with the bees—the stand being arranged so that she could do this. Knowing pretty well that the old queen would issue with the first swarm, the owner had found and clipped off one wing, to prevent her flying with the bees. They were left without any one to care for them particularly, and there was no fear of their going to the woods. The first move of the bee-keeper, when he got home, was to break up the swarming fever, in order to secure the strongest colonies. He said he was satisfied long since that a strong colony divided into two moderately so, will not secure half the quantity of

surplus they would if they remained together. Hence the motive to prevent swarming. Up to this time he had operated to make all equally strong. I never saw a lot of 70 hives that were so nearly equal in strength as this one. His weakest were re-inforced by help from the strongest in this way: A comb full of brood near maturity, and sealed up, was taken from the strongest hive, divested of mature bees, and given to a weak one. This brood required no attention from those it was given to further than to be kept warm. It would all mature and hatch out in a few days, and remain where matured, adding greatly to the strength of the stock. Two or three combs, even if taken from different hives, make a weak hive as strong as the best. The hives from which the brood was taken were supplied with clean, empty combs, which were soon filled. The yield of honey up to this time had been only moderate. Hence there was more brood than honey in every comb. He had boxes on every hive; extracting, in which they were just commencing, seemed unnecessary so far. His hives are described in the *American Agriculturist*, June, 1873. Without them, he says, he could not afford to manage bees. On his arrival he commenced operations at once. Took off the roof and top of the hive. Raised the latches of the corners, and took away the four sides, and left the combs and the 24 boxes at the sides and top as yet standing on the bottom board, not disturbing a bee. The boxes could be picked up from any side, and set off with the bees in them, which left the first outside combs and bees on them exposed, but they seemed so demoralized by the sudden exposure to the light, that they showed but little disposition to sting. If any anger was manifested, the smoke was at hand to quiet them. A person stood on each side, unhooked and picked up a comb, and looked it over for the queen, when, if not seen, it was hooked on a bottom board placed at the side, just large enough for six. Another was looked over in the same way, until the queen was found and put in a cage. Two combs were left on the old stand with six empty frames put on with them; the boxes were then put on the same as before, and the hive shut up. The queen was then put in. The combs on the new bottom board had most of the bees shaken from them in front of the old hive, and were then covered with a box just large enough to do it—entrance very small. Enough young bees would remain to nurse and keep warm the immature brood, and it was all that they were expected to do for three or four days. The time taken to do this did not exceed ten minutes. The bees in the old hive would continue to work in the boxes, and put new white comb in the empty frames. At the end of three or four days, the frames with the new combs were to be removed, and the old ones returned to the original hive, after removing all queen cells from them. The new white comb that was built in the empty frames was to be taken out and put in boxes, before any brood had advanced to mar it—it is made faster in the hive than in the boxes. It seems to be pretty well understood that when a surplus box is put on empty, it is longer before the bees even begin to make comb, than it takes to fill the box with honey when they have combs to hold it, ready made and put in. A piece, an inch square, is a great encouragement to begin in the boxes, but a piece of new white comb, the full size of the box, is still greater, because they have nothing to do but fill it, and lengthen the cells a little and seal over. Experience has proved this correct in the past, and more particularly the present season. Secretion of wax has been more tardy this season than usual. And I have no doubt that this artifice to get combs ready made to put in his boxes—instead of having it made there as they want to fill it—will add thousands of pounds of honey to the amount he will get—counting all his stands—I came near putting it 10,000.

It has not been a good season in this section for extraction, it having been so very wet, without a whole week of pleasant weather—several weeks can be counted up to this time, July 1st, without a pleasant day. So little honey was obtained early, that there was plenty of room in the comb for brood. The bees seemed to get plenty of pollen to nourish it with, and nearly every square inch was filled, when a half dozen pounds would exceed the whole amount of the honey in the live—one hive contained even less than a half pound, and yet had commenced to store in the boxes. This state of things being general, led to the prediction that it was going to be a swarming season. I ventured the suggestion. It has been verified. Every fair day through July has sent out swarms. I doubt whether my friend succeeded in breaking up the swarming fever; I have not heard. But this is quite certain, that he succeeded in getting a good supply of pure white comb for his boxes. When a good quantity of empty old comb is on hand, and given to the bees as they begin to accumulate honey, and if extracted thoroughly, it has a tendency to discourage swarming more than anything else that we have discovered. I know a man who had a strong early colony, and did not deprive it of any brood to help weak ones, but added empty combs in between full ones, until they had over thirty, 10x18 inches square. Nearly all were pretty well

filled with brood, and when the flowers began to yield plentifully, there was a force of three or four strong swarms to gather it. Basswood, in connection with clover, yielded at once for a few days. At this time he extracted and weighed what was collected in two days, which amounted to 57¼ pounds. This is the greatest amount I ever knew of. Time was when I thought 3½ lbs. a day was extraordinary. I once weighed some box-hives, when they had to make combs to hold the honey as collected. One hive gathered 12 lbs., another 16 lbs. in a week. The yield of honey probably was as bounteous as it was during the two days mentioned. I mention these things, to show that some of us have learned to obtain more from the same number of bees, in less time than we did only a few years since. What is there to discourage us? If dairymen are to be commended for obtaining more and better cheese from a given number of cows, or the farmer more wheat from the same number of acres, are we not entitled to some credit for the effort to obtain the larger amount and better quality of honey?

It is important that every hive—in most localities—be now thoroughly examined. See if there is a prolific queen and a strong colony for winter, if there is any foul brood, and if the stores are sufficient for winter. If the queen is absent, give them one. If right, and bees are wanting, feed moderately every day steadily during this month. If queen and bees are right, and stores are scarce, from extracting it all out, or other cause, feed a little more, not over two pounds a day. I will say further next month. Syrup made of white sugar, is good for winter stores. The difference in price per pound between honey and sugar is from 5 to 25 cents, and when the price for pounds enough is reckoned, it will pay for some trouble.

Care must be exercised in taking off boxes—which should be done as soon as honey falls—to prevent the honey from being carried out. It is taken from unsealed combs first, and sealed ones next. Bees that are in the boxes, when off, will each take its load, and immediately return for more; if they can have access to the boxes, they will do it at any season when honey is scarce. To get rid of these with little trouble, take an empty barrel—one head out—put in the boxes, so that the bees can creep out, and cover the barrel with thin muslin; they will collect on the under side in the endeavor to escape. Turn it over quickly a few times, they will all leave, and if unable to get to the boxes again, will soon be quiet.

Game Fowls and our Poultry Societies.

It is a noticeable fact that the department of Games in our poultry exhibitions is the great center of attraction. Game fowls command higher prices than any of the old varieties, the eggs sell higher, and they are more extensively advertised in the poultry journals. The secret of this popularity lies mainly in the use to which these birds are put. The game is unquestionably a good bird for eating, but is no better than some of the less quarrelsome varieties. They are prolific, but are surpassed by other varieties. They are quite handsome, but this is not what they are bred for. The only thing in which they excel all other domestic fowls, is their capacity to fight until the last gasp. No doubt, many breed them for their flesh and eggs. They are frequently crossed with other fowls, but their quarrelsome disposition does not make them favorites with the poultry-men who only want flesh and eggs. They are mostly bred for the pit, and there is unquestionably an increasing love of this cruel sport, principally among a certain class in our cities and villages. Cock fights are common, held in some places on the sly, in other places quite openly, and attended by the same rabble that run after prize fights in the ring, and for the same reason. They show courage, and draw blood, and offer opportunities for betting and gambling. Frequently a main is fought, and several cocks are pitted against a similar number upon the other side. It is expected in these contests that all the cocks upon one side will be killed. The worst passions are stirred by these brute contests, and there is the same objection to them that there is to other forms of gambling. The bull fights of Spain are no more bloody and cruel. They tend to harden

the sensibilities, and so corrupt the morals. All the associations are low and degrading. There may be laws against these contests in some of the States, but they are seldom enforced, and do not remedy the evil. Our poultry societies have some responsibility in fostering the breeding of these birds. As a matter of fact, we think most of them would be found obnoxious to the charge of discriminating in their favor, instead of encouraging the more useful and ornamental varieties. In looking over the special premiums of the fifth exhibition of the Connecticut Poultry Society, where we should hardly look for such discrimination, we find the highest premium in the list, valued at \$50, offered for the best collection of game fowls. With the single exception of the Asiatic fowls, the largest amount of premiums is offered for games. The premiums for turkeys, the most valuable of all our domestic birds, amount to \$34. For geese, \$8. For Hamburgs, \$28. For the games, \$225. Now, if the object of these societies is the promotion of the common weal, the highest premiums should be offered for the birds that are most useful, or for those that promise to be such. The managers should so arrange the list of premiums, as to draw out the birds that will be most profitable upon the farm, and in the poultry yard. No special inducements are needed for the breeding of game fowls. That business would take care of itself, if the premiums were altogether diverted to the more useful classes.

Canning Tomatoes, Fruits, etc.

A number of inquiries have reached us in regard to the canning business, especially with reference to tomatoes. One who has a few acres of tomatoes that promise a heavy crop, naturally wishes to make the most of them, and he thinks that his crop would be more profitable if he could can it, than if it were sold at the ordinary prices, and he writes to us to tell him how to do it. Persons who make these inquiries have but little idea of the extent of the canning business, or they would see the impracticability of carrying it on upon a small scale. In the large establishments, such is the division of labor and the employment of machinery, that the products are turned out at an exceedingly low rate. Three pound cans of tomatoes, are sold by dealers in New York at a handsome profit, at \$2.25 a dozen. There is no establishment, so far as we are aware, that puts up tomatoes exclusively, the operations include peaches and other fruits, and in Maryland, where are the largest factories, the working season is made continuous, by putting up oysters for the inland markets. We visited one of these large establishments in the peach season, and found over 100 women, black and white, engaged in peeling and cutting up peaches; all the cans used were made by machinery on the place, and the establishment was a small village in itself. We mention these matters, to show what one who undertakes the business in a small way has to compete with, and how difficult it will be for one, single-handed, to undertake a business that can only be profitably carried on upon a large scale, with every facility for rapid work. In the canning factory referred to, the peaches were peeled on the upper floor, and thrown into hoppers which extended to tables on the lower floor, the cans were filled by placing them under the lower end of the hoppers, and pressing the fruit in with the fingers.

The cans were then passed to another table, where syrup—about one pound of sugar to the gallon of water—was filled in, time being allowed for all the air between the peaches to escape. The cans then passed to hands who washed away whatever syrup was spilled upon them, and then they went to the tin-men; these put on the small circular cover, soldering it very rapidly; each cover had a small hole pricked in the center, to allow the escape of air, and after the soldering was complete, this hole was closed by a drop of solder. The soldered cans were then placed in an iron grating, and lowered into a tank of water which could be heated by steam. As the temperature of the water increased any imperfect cans could be discovered and taken out. The water was then raised to boiling, and the cans cooked half an hour, more or less, according to the size and the kind of the peaches. The cans were then placed in a store room, which had the capacity of a million, and was already well filled. The labels are not put upon the cans until they are ready to be packed in boxes. The factory was not running upon tomatoes at the time of our visit, and to answer inquiries as to canning these, we give an extract from the Oneida Circular. The canned goods put up by the Oneida community have an excellent reputation, and this is due to the great care with which their processes are conducted. We do not know what is the custom with the Oneida Community, but others engaged in the business, early in the season make contracts with farmers for their whole crop, early and late, at a given price, and they also make their contracts with dealers to take their product, long before a single can is put up.

The method of preserving tomatoes is simple. They are first slightly scalded, sufficiently to peel nicely, and when peeled, are thrown into pans in order to let some of the watery part drain off. They are then packed into 2½ pound cans, leaving just room enough for a large spoonful of syrup. This syrup is made by dissolving 2½ pounds of salt, and the same amount of sugar, in one gallon of water. The cans are then sealed and placed on sheet-iron pans, holding thirty-five cans each, and lowered into a vat containing boiling water of sufficient depth to cover them. If a can is not tight, it may be readily discovered by the air which will escape through the hole, causing bubbles to rise to the surface of the water. The leaky can should be immediately taken out and the hole stopped. All kinds of vegetables and fruits put up in cans, should be first tested in this way before they are bathed. When a vat full of tomatoes has thus been tested and prepared, the pans are lowered into the vat, one top of the other, and the steam let on, allowing the tomatoes to boil thirty minutes. In case cans larger in diameter are used, longer cooking will be necessary. When the tomatoes are done, the pans and their contents are hoisted out, and the cans, after they have cooled a little, are vented by opening the prick-hole in the cap with the soldering iron, allowing the steam to escape, and then immediately closing the aperture. When the cans have cooled, if all right, the heads will snap in by a slight pressure, showing that there is a good vacuum.

Ogden Farm Papers.—No. 55.

I have several letters from parties interested in the record of pedigrees in the Herd Register of the American Jersey Cattle Club, of which I am Secretary. One asks: "Is it really a fact that the fee for registration has been increased to \$5? In talking of the matter, I have heard expression given to intentions, by breeders in this section, that if carried out, will not tend to

increase the number of herd registered animals. Who are eligible, and what are the requirements for admission to the club?—I should like your opinion as to whether it is advisable to breed from a Jersey with a pink skin. I have known several animals exhibiting this peculiarity, that made yellow butter, and have also seen cows with a yellow hide, whose product of butter was very light colored. I can account for these facts only by the following supposition. Every animal has the power of secreting a given amount of the yellow coloring matter. An equal development in one may be sufficient to furnish an abundant supply for both skin and mammary glands; in another the production in its escape from the body, may be excreted almost wholly by the skin, or, on the other hand, be secreted in connection with the milk. Now, is this theory correct, or are the animals that I have noticed exceptions to the law, that the color of the skin is an index of the color of the butter?"

As many are interested in the question of registration, I think it may be worth while to say, that it was proposed at the last meeting, and approved by the club at large, to raise the charge for animals not belonging to members of the club to \$5 each, the reasons for the change being that the club has done much to extend a knowledge of the value of Jersey cattle, and to secure a reliable record of pedigrees for the benefit of all who are interested in the breed, and that its present plans contemplate the expenditure of considerable sums in ways which will benefit equally those who are, and those who are not, members. The members have contributed, by their initiation fees, to the fund for the accomplishment of these objects, and it was considered only just that those who have taken no part in the movement should be asked to contribute in the way of increased registration fees.

The club is not a money making institution, and whatever income it may receive will be expended for public benefit. At the same time it has not yet been decided that the fee shall be increased, and it remains at present at the old amount—\$2. The membership of the club is open to all who, after being recommended by a member as a "careful and reliable breeder," shall not be voted down when their names are submitted for election. Since the organization of the club there have been, I think, but two instances of rejection, and both of these were for sufficient cause.

The question of the formation of the yellow pigment of the Channel Islands cow, is understood only in a very empirical way, and, as far as I know, it is impossible to answer the question propounded. I know no reason for refuting the theory advanced by my correspondent, neither do I think that his position, in the present state of our knowledge, can be scientifically substantiated. I have known very good cows with pink hides to produce quite yellow butter. I have also known those with a much more yellow hide, who gave butter of a lighter shade, but I believe that I never knew one, the yellow secretion of whose *ears* was not a pretty fair index to the color of the butter. In Guernseys especially, where the butter is often yellower than in Jerseys, it is by no means unusual to see pink-skinned cows, but the yellow ear is almost universal.

Mr. Mackie, to whose excellent herd I have previously alluded, wrote me in June: "I have tested my 3-year old heifer Mulberry 2nd.

In 7 days on grass alone she made 13 lbs. 4 oz. of butter, in the last half of the week making fully 2 lbs. per day." This has occasionally been exceeded, but it is not often equaled, and the statement is the more valuable from the entirely reliable source from which it emanates.

I have received the following from Mr. J. M. Codman, Brookline, Mass., who has made an importation of Guernsey cattle, having been induced to do so by the deep color of the Guernsey butter, exhibited at the Channel Islands Agricultural Fair in Jersey a few years ago. He says: "I must differ with you in your theory that Guernseys are more apt to take on flesh while milking. I do not see that it is more characteristic of this breed than of Jerseys, individuals do, and do not. I think it possible that, for ability and service for dairy farmers, the Guernseys would be more desirable; in regard to color of butter, I think your position about coloring is not quite tenable. Artificial color is virtually a deception—you do not know what you buy. Why should a yellow skin be a 'point' of such value in judging cattle? Why color at all, unless to imitate something worth imitating, to make butter sell? If you say with me that 'there is no question as to the superiority of color with the Guernseys,' and if you state in the *Agriculturist* that if 'you would go in for butter alone, you would have a herd of selected Guernseys'? How do you reconcile the two statements, without implying that the Guernseys have other points of superiority besides color of product? Then as to the main question, which breed will get the most butter from a given amount of food: A large Guernsey would naturally eat more than a small Jersey, but I think it would be accounted for in the pail. I have not many data for submission, or comparative tests, but will give you two that I have, to compare with others that you may have, and as an addition to your statistics, from which to draw a sound opinion.

"'Sapphire,' Guernsey cow, calved first calf Oct. 15th, 1872. Jan. 13th, 1872—11 quarts milk made 2 quarts cream— $1\frac{1}{2}$ lbs. butter. $6\frac{2}{7}$ quarts milk to 1 lb. butter.

"Jan. 9th, 1872—mixed milk of 4 Guernseys at different distances from calving time—13 quarts milk made 3 quarts cream— $2\frac{1}{2}$ lbs. butter— $5\frac{3}{4}$ quarts milk to 1 lb. butter."

I am glad of the opportunity to publish this or anything else I may learn in favor of the Guernseys, and I am quite ready to concede all that their admirers seem to claim, save that I do not believe them as a race to be materially more productive than Jerseys, nor is the deeper color of their butter of special importance, for Jersey butter is quite yellow enough. No farmer, who has a taste for fine stock, would, I think, put the larger size and deeper coloring of the Guernseys into the scale against the more stylish, thoroughbred, and attractive look of the Jerseys. If two animals are of equal practical excellence, personal beauty will always bear the palm: and this alone I believe to be the secret of the greater popularity of the Jersey breed. After a pretty thorough investigation of the whole subject here and on the Islands, I believe that the evidence of practical productiveness and value is about equally balanced between the two races.

W. C. Blackfan, of Penn., finds fault with my recommendation for making hay, as given in the July number of this series. He says: "I do not object to starting the mower, as he

says, at 5 o'clock, but prefer running it after the dew is off, for this reason: the dew will dry off the grass better standing than cut, and cutting without the dew it will not lay so compact, therefore it will dry faster. My plan is, to start the mower in the morning, and if a good day, the hay will be ready to start the rake by one o'clock, hauling by two. And this I would state constitutes agricultural economy."—If grass is to be left as it falls from the machine, until the rake is started, of course the dew should be off before it is cut, but my plan contemplated the constant active use of the tedding machine, from the time the mower stops, say at 8 o'clock in the morning, until the grass is ready for raking. Probably the radical difference between Mr. Blackfan and myself is, that I propose to cut grass when very young and tender, "just in blossom," while he leaves it to stand until so ripe that its needs but little further drying. I still think that practical "agricultural economy" will be much better advanced by the pursuit of my system, especially when we consider the greater nutritive value of early cut hay.

The deep can system is slowly making its way throughout the country. I have a letter from a correspondent in Southwestern Virginia, who says: "From reading your papers, I was induced to try the deep can system at my butter factory, and I am so well pleased with the result, that I write to thank you for giving the public such information. Up to this time I have used common tin cans; will you please give me the name of a house in New York, where I can get the kind that you use?" (Iron-clad Can Co., N. Y.)

Last April I received from a correspondent in Iowa, a marvellous statement about the production of a young Jersey cow, which was to calve in about six weeks, but was still giving from 3 to 4 quarts a day, and showing over 40 per cent. of cream. I requested him to write again after she had had her next calf. He now writes, July 28th: "My heifer did not come in until a month later than I supposed she would, some three weeks ago. For the last three weeks I have kept account of her milk. She is running in pasture, wild marsh grass, about a mile from my house. I take her there mornings, and bring her home nights. There is some irregularity about it, which I suppose accounts for the fact that her yield is not regular. I feed her well at home, night and morning. During the last week she has not given less than 17 quarts a day, and has given $19\frac{1}{2}$ quarts, probably 18 quarts on the average. I think this is a large amount for a three year-old heifer, especially when she is not on extra pasture, and a long drive at that. As to quality I have made but one test, having been away most of the time. That was about five days ago. The milk showed 23 per cent. of cream. We have made some butter, but not in a way to give accurate figures. My wife says it takes 8 quarts to make a pound of butter. How is this as a showing for a three year-old Jersey, taking quality, quantity, and circumstances into consideration?"—I give this statement partly because it is a remarkable one, and comes from one whom I believe to be entirely reliable; partly however as an answer to a suggestion which has been made frequently, that a record of the production of a dairy cow should be taken as a test at exhibitions, rather than the pedigree and general character of the animal. If we make production the test, we

are bound to accept every apparently authentic statement that is received. And especially in a country like ours, it would be impossible to investigate the reliability of those making the reports, and the accuracy of the methods which had been adopted. The statement made above is not an improbable one. There is no question that the writer fully believes it to be true. At the same time, I should hesitate to award a premium on such a statement, without knowing absolutely that there had been no possibility of error, that the quarts had been measured by the same careful person, that they had been regularly recorded, that the week's product of milk had been carefully set and skimmed by itself, and that the product showed an average of one pound of butter for each 8 quarts of milk. While it would be practicable to secure evidence to this effect in a few individual cases, no such test can be established without the danger of excluding equally meritorious animals, simply because of the lack of authenticity concerning the evidence. The owner of this heifer is certainly to be congratulated upon the great prize he has drawn, and congratulations are equally due to the agricultural neighborhood in which he lives, that they have the opportunity of securing bulls from such an animal.

The Mount Fordham Herd.

The Mount Fordham herd of Shorthorns consists of between 30 and 40 head of choice animals of the most popular strains. They are the property of Col. L. G. Morris, of Fordham, N. Y., and have been selected and imported by himself in 1872, or purchased at the New York Mills sale in 1873. The bull "Beau of Oxford," which leads the herd, was purchased of Hon. E. Cornell. It is doubtful if there is another herd in America that represents more fully the best strains of what is known as the Bates blood. On a recent visit to Mount Fordham we were favored with an opportunity of procuring portraits from life of three animals of this herd, which are presented upon the first page of our present number. These fine specimens of this breed of cattle very fairly represent the herd, which is remarkably even in character and excellence. The bull "Earl of Clarence" is roan in color, was calved September 12th, 1871, and is now about three years old. He was bred by the Earl of Cawdor, his sire was "3d Duke of Clarence," and his dam "Henrietta the 9th," which was by "Duke of Wharfedale," out of "Henricetta." He is a fine young bull. The foremost cow is "Tacita 3d," a light roan, five years old, of the White Rose family, and counts in her pedigree the bulls "Duke of Claro," "May Duke," "Duke of Gloster," "Earl of Derby," which was bred by Mr. Bates, and also two other Bates' bulls. This is a very smooth cow, with a fine coat, and is a good milker. The cow in the rear of "Tacita 3d" is "Lady Worcester 8th," a red roan, 4 years old, of the Wild Eyes family, and very finely bred. Her pedigree includes "Mar-ton Duke," "Red Duke 3d," "Duke of York," "2d Cleveland Lad," and the "Duke of Northumberland," the last three all bred by Mr. Bates. Col. Morris is a breeder of long experience, he having been engaged in enriching the Shorthorn stock of America since 1850. The catalogue of his herd recently issued contains the pedigrees of all the animals except the present year's calves. None of the herd are for sale, but bull calves and yearling bulls

The Grayling.

The fish culturists have during the present season been much excited over the Grayling and its artificial propagation. That most excellent authority upon all that relates to hunting and fishing, *Forest and Stream*, has devoted much space to making this fish known to anglers and fish culturists. The fish is quite abundant in some of the Western waters, and there is probably more than one species. The one especially talked about is called the Michigan Grayling, *Thymallus tricolor*, but an English correspondent of the paper just alluded to, declares from the engraving that the fish is the same as the species found in European waters,

Salmo Thymallus, or, as called by other authorities, *Thymallus vulgaris*. At all events, whether ours be the same or not, there is a strong probability that a valuable fish will soon be introduced into our Eastern streams, and thus not only add to our food supplies, but furnish another important fish to our anglers, for it is emphatically a game fish, taking the fly readily. The credit of first bringing the grayling into domestication, is due to Mr. Fred. Mather, of Honeye Falls, N. Y., a gentleman who has heretofore given us interesting notes on fish culture. Upon his arrival home in April, after his expedition to Michigan, (of which an interesting account was given in *Forest and Stream*),

he sent us word of his success; he started from Crawford, Mich., with 180 fish, and reached home with the loss of only 12. Mr. Mather sent one of his fish to *Forest and Stream*, from which Mr. Forbes made a drawing, which appeared in that journal, and also the one which is here presented. It will be seen that it is longer in proportion to its thickness, than the trout, and is thought by many to be equally beautiful. Mr. Mather is very enthusiastic over this matter, and we can

not do better than give the description he gave in the above named journal, where he says, April 23: "The grayling has all the fins of a trout; his pectorals are olive brown, with a bluish cast at the end (I am describing him in the water as

I saw him in the ponds an hour ago), the ventrals are large and beautifully striped with alternate streaks of brown and pink, the anal is plain brown, the caudal is very forked and plain, while the crowning glory is its immense dorsal;

relationships we should expect to find the Grayling excellent upon the table. It is held in high esteem in Europe, and we have heard Europeans regret its absence in this country. It is very local in its habits in England, but

that peculiarity may be overcome by artificial propagation. We look forward to the time, and that not a far distant one, when every farmer who has a permanent stream or pond upon his place, can be able to go to it with as much certainty of obtaining the desired quantity of fish, as he can now go to his barn-yard for poultry, and we regard every improvement in fish culture as of importance. Especially then is the introduction of a hitherto almost unknown fish, a matter of general interest, and

THE GRAYLING.

this fin rises forward of the middle of its back, and in a fish a foot long, it will be nearly three inches in length by two high, having a graceful curved outline, and from 18 to 20 rays dotted with large red or bluish purple spots, which in life are brilliant, and are surrounded with an emerald green, which fades after death; it does not seem as if this green could be represented by the painter's art; it is the changeable shade seen in the tail of the peacock."

The grayling spawns in the spring, and Mr. Mather writes us, that he thinks that it will probably replace the trout, in streams where there are numerous enemies that devour the

we desire to give full credit to Mr. Mather for his active agency, and to our cotemporary for the enterprise it has manifested in the matter.

Imperial Pekin Ducks.

BY GEO. P. ANTHONY, WESTERLY, R. I.

[In February last we gave the first account, (so far as we are aware), of these new ducks. Recently Mr. George P. Anthony, of Westerly, R. I., who has been successful in raising them, sent us a photograph of a pair of his birds, from which the engraving is made; with the accompanying notes. Ed.]

IMPERIAL PEKIN DUCKS.

The Imperial Pekin Duck was unknown in this country or Europe, previous to the spring of 1873; the following is a brief account of their importation. Mr. McGrath, of the firm of Fogg & Co., engaged in the Japan and China trade, in one of his excursions in China, first saw these ducks at the city of Pekin, and from their large size, thought them a small breed of geese. He succeeded in purchasing a number of eggs, and carried them to Shanghai, where, placing them under hens, he in due time

obtained fifteen ducklings sufficiently mature to ship in charge of Mr. James E. Palmer, who was about returning to America. He offered Mr. P. one-half the birds that he should bring to port alive, and the latter, accepting the offer, took

trout spawn in the long period required to hatch it. The Grayling belongs to the *Salmonidae*, or Salmon Family, of which the Salmon is the type, and our lake and brook trout still more familiar representatives, and from its

charge of them. Six ducks and three drakes survived the voyage of 124 days, and were landed in New-York on the 13th of March, 1873. Leaving three ducks and two drakes, consigned to parties in New-York, to be sent to Mr. McGrath's family, (who never received them, as they were killed and eaten in the city). Mr. P. took the three remaining ducks and drake to his home at Wequetequoc, in Stonington, Conn. They soon recovered from the effects of their long voyage, and commenced laying the latter part of March, and continued to lay until the last of July. They are very prolific, the three ducks laying about 325 eggs.

The ducks are white, with a yellowish tinge to the under part of the feathers; their wings are a little less than medium length, as compared with other varieties; they make as little effort to fly as the large Asiatic fowls, and they can be as easily kept in enclosures. Their beaks are yellow; necks long; legs short and red. When the eggs are hatched under hens, the ducklings come out of the shell much stronger, if the eggs are dampened every day, (after the first 15 days), in water a little above blood heat, and replaced under the hen.

The ducks are very large, and uniform in size, weighing at four months old about twelve pounds to the pair. They appear to be very hardy, not minding severe weather. Water to drink seems to be all they require to bring them to perfect development.

I was more successful in rearing them with only a dish filled to the depth of one inch with water, than were those who had the advantages of a pond and running stream.

Walks and Talks on the Farm.—No. 129.

Newton Reed writes: "In preparing my ground for wheat, I haul the manure in June on to the corn stubble, and plow it immediately under; and the land is plowed again two or three times, before sowing the wheat. I have practiced this method several years, with good satisfaction, except a slight suspicion, that there may be some loss to the manure."

I should have no fear on that score. I do not think there is likely to be any loss of manure from evaporation, and I do not see that there is much danger of the manure leaching out of the soil during the summer months. I do not recollect an instance on my farm of our ever having rain enough during the summer to start an underdrain, after it had once stopped. In the spring, and perhaps late in the fall, a small portion of the manure may leach out of the soil, but I think not in the summer, even if the land is in bare fallow. I think Mr. Reed's plan a very good one. "My object," he says, "is to clean the land of weeds, thistles, and quack-grass. The oat crop, which used to come in between corn and wheat, has become here so poor, and allows such a growth of weeds, that I am willing to omit it, and cultivate the land as a fallow. We expect enough better crop of wheat and grass, to pay for loss of the oats."

Mr. R. adds: "I sell milk to Borden's Condensing Milk Factory, and keep as many cows as my grass will feed, and besides I feed all my corn, and as much bran purchased for the purpose."

Mr. R. says that bran makes rich manure. There is no doubt on this point. I think if I was a dairy farmer, and could dispose of the milk at a paying price, I should aim to feed at

least a ton of bran a year to each cow, and half a ton of corn meal. I am not sure that it would pay for the first year or two, but it would be profitable in the end, provided the manure was carefully saved and applied. The great objection to such a system is the fluctuations in the price of bran. Sometimes we can buy it here for \$15 per ton, and sometimes we must pay \$35 per ton.

"Yes," said the Deacon, "I take it the dairy farmers understand their own business. They will adopt the system which long experience has taught them is the best and safest."

That is all true, and I would be the last man to assume that I understand how to manage a dairy farm as well as a dairy farmer. I was only saying that it seemed to me, that a farmer, who had a ready market for all the milk he could produce, at a fair price, could easily manage to enrich his land. With us here in the wheat-growing section, the great trouble is to make a profit on our live stock. If we could do this, it would be an easy matter to make our farms rich.

Last year I manured the east side of my wheat field. The manure was rich and well rotted. We put on only a slight dressing, but the effect was very decided. When we were cutting the wheat, one of the men who were binding after the machine, and who did not know that only a part of the field was manured, remarked, "if it was all as heavy, as it is on the east-side, we should have something to do. The straw is perhaps no longer, but the heads are larger, and every one of them is full of grain." I think the thrashing machine will show this to be true. I have frequently heard farmers say, when discussing the question as to why we can not raise as good wheat now as formerly, "it is not because our land is poor. We can grow straw enough, but the grain is not there." So far as my observation goes, we seldom get too much straw. But whether this is true or not, I feel sure that a little rich manure is precisely what many of our wheat fields need, to enable them to yield a good crop of grain.

Last year my wheat was seriously injured by the Hessian fly. This year the crop is almost entirely free from it. I have been thinking whether the harrowing, which I gave the wheat last fall, has any connection with this fact. As I understand the matter, the Hessian fly lays its eggs on the leaves of the young wheat plant early in the fall, and it is just possible that the repeated harrowings interfered in some way with the process of hatching. I do not know that there is anything in this idea.

We have had a grand crop of hay this year, and it is of excellent quality. Hay and straw will be cheap with us the coming winter, and store cattle and sheep are consequently likely to be wanted at better prices. An old farmer of my acquaintance who lives near the city, has a big barn, and he says he has found from experience, that if he puts hay into the barn, and lets it stay there until he can get \$20 per ton for it, he has never had to keep it over three years. It is seldom that he has to keep it two years. It is with hay as with wool, wheat, corn, and barley; when the price is low everybody seems willing to sell, but when prices are high, everybody is desirous of holding.

"Old corn is scarce," writes a farmer in Missouri, "and is worth 75c. to 80c. per bushel."

I do not know the fact, but I presume a year or eighteen month's ago, farmers were selling their corn there for 25 cents, or using it for fuel. "Well," replied the Deacon, "what are you going to do about it?" Nothing. It has always been so, and what has been, will be. What we want is more faith. We should not go with the stream. You, Deacon, and many others, thought the bottom had fallen out of farming. You thought we should never see good prices, good crops, and good times anymore. "I don't see them yet," replied the Deacon. They are coming, nevertheless. Stick to the farm; farm well, and your chances of success are certainly as good as in any other business. "The railroads are ruining us," said the Squire, "they have just advanced their rates on cattle." I am not going to defend the railroads. But this advance in rates will not hurt the good farmer as much as the farmer who keeps nothing but inferior stock, and half starves it. A choice well-bred and well fed steer, weighing 1500 lbs., is worth \$100 in Chicago. The freight on him to New York is \$8.25. A common, inferior steer, weighing 750 lbs., is worth in Chicago \$20, and the freight on him to New York, is \$4.12. The freight on two thousand dollars worth of the good steers is \$175; and on two thousand dollars worth of the inferior animals \$412.50. Let us make the railroads do the fair thing, if we can, but in the meantime, let us not neglect to improve our herds of cattle, sheep, and hogs.

I have always said that winter wheat was our best crop to seed down with. This I believe is also the general opinion of our farmers. But this year I have wheat on one half of a field, and barley on the other half. I seeded the whole field this spring with clover, sowing a peck per acre. The young clover on the wheat is only fair, while on the barley it is superb! "Yes," said the Deacon, "I never saw a handsomer field of barley, or a handsomer patch of clover." It is worth something to get such a confession from the Deacon. I have not thrashed yet, but I expect 45 or 50 bushels of barley per acre.

Geo. M. Lyons, of Titusville, Pa., writes me that he shall be glad to furnish crude petroleum by the barrel, to any readers of the *American Agriculturist*. Where petroleum can be obtained at a cheap rate, I have no hesitation in recommending its frequent use for preserving wood. The longer I use it the better I like it. I have an old Walter A. Wood's Reaper that I have used and abused for ten years, and the platform and other wood work of the machine is as sound and good as when it was new. Every year I wash it over with petroleum, wood work, iron, and all. Fork, hoe and rake handles are greatly benefited by a washing of petroleum every few months. It makes them hard and smooth. We had occasion a few days since to bore a hole in an old cultivator that has had frequent applications of petroleum, and we found it no easy matter to get the auger into it. It was almost as hard as iron. But there is one thing about petroleum that ought to be understood. A slight dressing seems to do very little good. You must get rid of the idea that you are painting. You want to get the petroleum into the wood. The drier the wood, and the hotter the weather, the better. The end of a board, or of a stick of timber, will absorb far more petroleum than the sides. The pores will absorb the oil, and as fast as it is taken in, put on more. To a

careful farmer, who houses his implements and machines, petroleum is not necessary. He would be likely to think it a nuisance, as the implements will for some time afterwards soil his hands and his clothes. But to a careless farmer, like myself, who leaves his implements and machines more or less exposed to the weather, petroleum will be of great benefit.

"Better learn to put things up," says the Deacon. I admit that. But even the Deacon sometimes leaves a wagon cracking in the sun, or a hay-rack rotting in the rain, and his stone-boat is not always turned up on its side.

We are now, (July 23,) thrashing our wheat—drawing it in from the field as we thrash. I am the only man in this neighborhood who adopts this practice. Come and see how it works. After the wheat is cut, and the sheaves put into stooks, we rake the ground carefully between the rows of stooks, going over the ground twice in opposite directions. Before commencing to thrash, we load up all the rakings. When these are thrashed, all is plain sailing. We have three wagons and two teams; as soon as a wagon is unloaded, it is pushed out of the way by hand, and the next load is driven up. The man who has just unloaded the previous wagon, takes off the team and puts it on to the empty wagon, and goes to the field for another load. He reaches the pitcher just as he has finished the third load, and the work is fairly commenced. There is one wagon at the machine, another going back or forth, and another being loaded in the field. Where this kind of work is new to the men, it will be likely to dissipate some of their old traditions. They will find that a machine does not thrash as fast as they have hitherto supposed. Two of my best men jumped on to the wagon to throw the sheaves to the machine. I had a man to spare for half an hour, so I said nothing. It is one of the old notions that it takes two, three, or four men to "get the grain to the machine" from the stack or bay. "One man can't give it us as fast as we want it," said the thrashers. "Perhaps not," I replied, "but at any rate one man can throw the sheaves off the wagon, as fast as the man in the field can pitch them on to the wagon."—"We want three good men on the straw stack."—This is another traditional notion. "One man is pitching on to a wagon all the grain and straw that is going through that machine."

"But wait. They have just finished a load, and the thrashers see we are talking about them, and are doing their best. Let us see how long it takes to thrash the next load.—How long? Fourteen minutes, and there was 15 bushels in the load. That will do. Now then, about stacking the straw. With a fair crop of wheat like this, that will go say 30 bushels per acre, there is about 100 lbs. of straw to each bushel of grain. That load we have just thrashed, therefore, weighed 2,400 lbs. The machine takes out 900 lbs. of grain, and 1,500 lbs. of straw is elevated by the straw-carrier on to the stack. Now, if one man can pitch 2,400 lbs. on to a wagon, at an average height of 9 feet, why are three stout men required, to handle 1,500 lbs. in the same time on the level?" "You get on to the stack and try it," says the Deacon, "and you will find out."—I have been there a great many times. The labor consists, not in moving the straw, but in moving yourself about the stack. And the way to lessen the labor is to make large forkfuls. An aver-

age forkful of straw, say as large as a two-bushel basket, does not weigh more than 8 lbs. As men usually build a stack, they walk around the outside more than in the center, while the center ought to be kept full and trodden solid, so that, as the stack settles, the inside or roof shall not settle as much as the outside. To do this, as well as to lessen the labor, you should, in building the outside layers of the stack, take pains to get the largest forkfuls of straw, and not waste your strength in placing a thin layer of straw around the outside of the stack. It is like carrying water in a two-quart pail. You move 150 lbs. of your own weight to move 4 lbs. of water.

Every year before commencing to thrash, the question arises "how long and how wide shall we make the stack bottom?"—This year we made it 36 feet long, and 20 feet wide. The machine stands about 3 feet higher than the bottom of the stack. After we had thrashed 402 bushels of wheat, the stack was 24 feet high, with an average width of 25 feet, and an average length of 38 feet. The stack therefore contains 22,800 cubic feet. And if we calculate that each bushel of wheat gives us 100 lbs. of straw, there is 20 tons of straw in the stack. This is not far from my old rule of calculating, that each ton of straw requires about 1,000 cubic feet of space. "But you won't leave your stack without topping it off," remarks the Deacon. No, I have got about 8 tons more straw to put on top. And it has got to go up there whether it will or not. By Monday morning the stack will have settled at least four feet, and I propose to carry the walls up four feet higher than they are now. Then by making a good steep roof, it will hold it all, and we shall have 28 tons of straw in a stack, the bottom of which is 36 feet long, and 20 feet wide. It is of course more labor to top off a high stack, but there is a great advantage in getting as much straw as possible under one roof.

Thick and Thin Seeding.

The fact that plants yield more largely when they are furnished with abundant room, and that the thin seeding of a crop, up to certain limits, yields a better harvest than any thicker seeding, is no new thing. We read of it in the works of the most ancient writers upon agriculture, and early historians record facts illustrative of the advantages of sowing thinly, and of the extraordinary yields of grain from single seeds. Nevertheless the subject is as fresh as ever, and we see every year good farmers wasting large amounts of seed, and sacrificing large portions of their crops. We have recently seen a piece of oats sown with one bushel per acre, which yielded a better crop than a neighboring field sown with four bushels per acre. A few years ago we divided a ten-acre field into five portions, and sowed them with wheat at the rate of one bushel, five pecks, six pecks, seven pecks, and two bushels of seed per acre. There was no perceptible difference in the soil of the field, nor any in the manuring, preparation, or sowing. At harvest time there was a very perceptible difference in the yield, the thinnest sowed portion being by far the best of the field, and the thickest portion the worst. Near the edge of the field, upon the thinnest sown part, where the seed had been thinned out by some pigeons, there were some stools of wheat with 30 stalks, each

bearing an ear; and in this part of the field the difference was mostly shown in this way, and in the length of the ears. The other side of the field, where two bushels had been sown, produced much shorter ears than this portion.

At a meeting of the Midland Farmer's Club, held at Birmingham, England, in June last, Major Hallet read a paper upon thin sowing and selection of seeds. It was illustrative of his experiments in raising what he calls "pedigree wheat." He exhibited a single plant of wheat from a single seed planted alone, which bore 94 stems, one of barley of the same character bearing 110 stems, and one of oats with 87 stems. He stated that a crop of wheat he had sown with single seed 9 inches apart each way produced 108 bushels per acre. He suggested the experiment be tried of drilling 8 quarts of wheat per acre early in September, and one quart additional for each week to the end of the month. Also that seed be selected from the produce of these plots for future sowing, with reference to its hardiness, its trueness to type, its quality of the grain, its productiveness, its power of tillering or casting up numerous stems, its stiffness of straw, and its earliness of ripening. His plan of selecting seed was to take the most perfect grains from the largest ear of the plant with most stalks, and plant them so that the grain from each ear occupied a row by itself, each grain occupied a hole in the row, and the holes 12 inches apart. This plan was repeated yearly, taking each year the best grain produced. By this course in several years he had succeeded in doubling the length of the ears, in trebling their contents, and in increasing the tillering power five-fold. Five pints of wheat planted 12 inches apart each way, upon an acre of ground in September, gave 1,001,880 ears, or 67,760 ears in excess of the crop from 6 pecks per acre sown upon the adjoining field. Later plantings reduced the crop somewhat. Two plants with 24 ears each gave 1,911 and 1,878 grains. 20 ears per foot, with 48 grains to an ear, will produce 88 bushels per acre. A bushel of wheat produced by this thin sowing contained 460,000 grains, while a bushel of ordinary wheat contains 700,000 grains. Here is interesting matter for consideration, and if, as seems scarcely to be doubted, thin seeding is more productive than thick, it might be very profitable to experiment in this direction. It is necessary to remember that for such seeding, to be successful, the soil must be rich and free from weeds, and that the crop also must be kept free from weeds by thorough cultivation. Although with better farming than we now have we can raise large crops, yet it is certain that the possibilities of better farming are not nearly realized as yet.

ROAD-DUST.—Road-dust should be gathered before the season closes. This is often the most convenient absorbent the farmer can command, and a few barrels of it will save a large amount of ammonia in the hennery, the privy, and the stable. Hens should have a large open box full of it under cover, where they may dust themselves at their pleasure. It is an excellent thing to have in the stable, and when saturated with urine makes a valuable fertilizer. The fineness of the dust, continually ground by the iron tires and horse-shoes, is one cause of its favorable action upon crops. That gathered from a clay soil is best—indeed sand, whether from the road or elsewhere, is of but little use as a deodorizer or absorbent.

A Simple Clod Crusher.

A very cheap and effectual clod crusher can be made by connecting a number of round poles together, as shown in the accompanying illustration. Staples are driven into the ends of each pole, by which the pole is fastened to the links of a chain which connect them all to-

A CLOD CRUSHER OF POLES.

gether. The ends of the chain are furnished with rings, to which the clevis of the double-tree is attached. Being flexible, the drag conforms itself to uneven surfaces. We have found such an implement useful for leveling corn stubble, and smoothing potato ground previous to plowing, also for spreading manure evenly, or for breaking clods in heavy soil.

Water for Stock.

One of the most difficult problems which has of late been proposed to us comes from Colorado. It is "how shall we best procure a supply of water for our stock; wells 50 to 100 feet deep, wind-power precarious?" Here is a difficulty which presents but one solution, and that is, storage of the water to tide over the temporary failure of the power. Steam-power is of course out of the question; animal-power is too costly, and needs supervision, and noth-

West, and many districts in the East suffer for want of water, and yet an inexhaustible supply exists everywhere beneath the surface. We would suggest the least costly wells; the Jilz auger well, for instance, which can be bored from three inches to twenty inches in diameter, can be tubed cheaply with wooden curbs or galvanized iron pipes, and which cost about one dollar a foot to sink. These wells, where water lies over 25 feet from the surface, must become the mainstay of the western farmer. Where water is near the surface, either this well or the common drive-pipe well may be cheaply used. The power used must be the wind, and a self-regulating wind-engine, which will run day or night, should be used to raise the water into tanks or cisterns upon elevated ground, where it may be stored, and from which it may be carried wherever it is required. The accompanying illustration represents the method used upon Beacon Stock Farm, Northport, N. Y., for providing a permanent supply of water for the stock. It is placed where the water can be used upon the road through which the cattle pass, or in fields upon either side of the road. A "United States Wind-Engine" raises the water from a well into a tank of cypress wood. The tank holds about 10,000 gallons, and the overflow only is used, except when the supply is short. Then there is the stock on hand to draw from. It is rarely that 24 hours pass without sufficient wind to replenish the tank, when it is once full. Another instance is known to us, in which a farmer in a Southern State, at a cost of only \$400, erected a wind-mill, dug a well, built a tank in an elevated part of the farm, to hold 60,000 gallons of water, and laid pipes to convey the water to his garden and stables. The wind-mill pumped 10,000 gallons in 24 hours. This seems a large quantity of water, but it is only seven gallons, about two pailfuls, per minute. This quantity of

A Handy Wagon-Jack.

On a recent visit to Beacon Farm, we noticed a wagon-jack of very simple construction,

Fig. 1.—JACK CLOSED.

which we here illustrate for the benefit of our readers. It consists of an upright support, to which is jointed in a peculiar manner an arm or lever. To the shorter end of the lever is jointed an arm, considerably longer than the upright support, to which is bolted an iron plate, furnished with short spikes.

Fig. 2.—JACK OPEN.

When in use, the spiked arm is placed beneath the axle of a carriage or wagon, the axle resting upon the spike that may be most convenient for the purpose. In this position the lever is raised upward, as seen in fig. 1. When the lever is brought downward, as in fig. 2, the axle is raised. By attaching a cord or chain to the lever, and hooking it to the upright leg, the wheel remains elevated. There is no patent-right attaching to this useful contrivance.

A Western Cattle Barn.

"Subscriber," asks for a plan for a stock barn, costing from \$1,500 to \$2,000, in which he may feed young cattle, until they are ready for market. From our own experience in feeding young stock, we suggest the accompanying plan of arrangement. To feed cattle profitably, they need to be comfortably placed, kept quiet, with every facility for getting in and out of their stalls, and to have no annoyance or excitement. For the convenience of their keeper, the barn or stable in which they are kept, needs to be arranged so that there is the least possible labor, in storing and distributing their feed, in feeding, watering, and cleaning them, and in removing the manure. As has been before stated, we prefer the method of accumulating the litter and droppings of the cattle, and feeding them in stalls, in which they can remain loose; or if they are tied up, to keep them in such a manner, that they can have plenty of straw under them to keep them clean, and to remove the bedding only when they are turned out in the spring. In this plan there is a vast saving of work of a disagreeable character through the winter, and when the manure is moved in the spring, it is in far better condition than if it had been exposed to the snow and frost for several months. In laying

PUMP AND CISTERN FOR WATERING STOCK.

ing remains but the wind, which works night or day without attention, and which must be utilized when it is available, to store up a lasting supply. The difficulty exists all over the

water will provide for a large number of stock, and several days supply are on hand to meet an emergency. We believe these instances meet the cases of our Colorado and other enquirers.

out a cattle shed, we should always do it with this object in view, even in the West, for although a Western farmer may scorn to think manure of any value, there will be no shed built this year which will be worn out before the time comes in which manure will be as highly thought of by the Western farmer, as it is now by the Eastern one.

Figure 1 shows the ground plan of the

Fig. 1.—PLAN OF CATTLE BARN.

proposed stable. It is made in two wings, facing the Northeast and Northwest. At the North corner is a square room which may be used as a store room, feed room, or for any other purpose. From this room passages run right and left, from which the cattle are fed. These passages may be 6 feet wide. There should be as many windows in these passages, as shall give needful light and ventilation through the stable. The stalls with racks or feed troughs opening into the passages, are in the rear, and the doors from the stalls open into the yard. These doors should hang upon rollers, and when rolled back, at least one half of the front of the sheds should be open. The yard will face the South and East, and should have a manure vault in the center, into which drains (shown by the dotted lines) should carry off the liquids from the stable. The yard may be fenced in, and feeding racks may be placed around it, in which in fine weather fodder may be given to the stock. Fig. 2 shows the elevation of the sheds, and the arrangement of the yard. The upper story is for storing hay, and at the center of the building, a windmill should be erected, to pump water for the stock from a cistern or well beneath it, or it could furnish power to cut feed if necessary. The extra cost of these conveniences, will pay for themselves

Fig. 2.—ELEVATION OF BARN.

in the course of one season, in saving of labor and in growth of the stock. A trough of water should run through every stall, so that the cattle may be watered when required, without being removed or unfastened. The cost of a shed, such as is here described, 200 feet long,

20 feet wide, and 18 feet high, with all the conveniences mentioned, and substantially built and painted, should not be more than \$1,500, and it may be built for much less.

Tightener for Wire Fence.

As fences made of wire are more used, it becomes all the more necessary to have a suitable method of tightening the wire. The usual manner of straining the wire in one direction only, tends to draw the straining post out of its position. But if the roller upon which the wire is wound, strains from both directions, the force is equalized so far as the straining post is concerned, and it is necessary only to have the end posts well stayed. In the method shown in the engraving, there are two posts fastened together with a cap piece, and set firmly in the same hole. Each post is well stayed with a brace, which supports it in the direction in which the wire is drawn. The posts are bored to receive rollers upon which the wires are wound. One end of each roller is made square, and somewhat larger than the round part. The holes in one of the posts are made square to fit the square ends of the rollers. A winch is also made to fit the rollers, and the wires are tightened by turning the rollers with the winch. One wire is wrapped from above, and the other from beneath the roller, so that both are tightened

TIGHTENER FOR WIRE FENCE.

at the same time. When the wires are drawn tight, the square end of the roller is driven into the square hole in the post, and the rollers are firmly held.

A Cement Roller.

Now that the sowing of fall grain is at hand, the attention of farmers is turned towards rollers. The use of the roller is too much neglected. A considerable portion of the fall wheat crop is sacrificed every season by broadcast sowing, imperfect harrowing, and the want of a compact, firm seed-bed. The wheat plant needs a solid stratum of soil wherein to push its roots, and a somewhat rough surface is an advantage to it. There are cases in which the use of a drill is not possible, and where broadcast sowing is unavoidable. In such cases especially, and in all others, the use of a corrugated roller, such as is here illustrated, will be found profitable. It will be found more useful than the smooth roller, even when the drill has been used. A smooth surface favors heaving by frost, and winter-killing. If such a roller, as is here described, is drawn across the field in an east and west direction, leaving small ridges, a great protection will be afforded to the wheat when the ground is bare of snow in the winter, and frosty nights are followed by sunny days. The ridges will be exposed only upon one side to the sun, and the

low elevation of the sun will prevent all but the tops of the ridges from being thawed. The north side of the ridges will remain frozen, as also will every hollow, and in these the plants will be safe. When the usual north wind blows, these ridges will intercept the drifting snow, and each hollow will remain filled with a protecting covering. We have found this plan of drilling wheat in the direction of East and West to be a great advantage in this way, and if the ground had been rolled with such a roller as is shown in fig. 1, the advantage would

Fig. 1.—CEMENT ROLLER COMPLETE.

have been greatly increased. The roller consists of segments eight inches thick, made of concrete, or a mixture of one part of cement and four parts of sand. The diameter of the segments is 30 inches. They are molded in the shape represented at figure 2. The center, in which the axle works, is made of four pieces of hard wood, cut so that the wear is upon the ends of the fibers, and which are channeled upon their outer edges. The centers are fastened in the mold and the cement is cast around them, where it sets and hardens, holding them firmly. Figure 3 shows the form of the centers. The segments are strung together upon an axle, consisting of an iron bar one inch in diameter, which is fitted into a frame. A tongue is fastened and braced to the frame in the usual manner, and two horses are required to draw it. Each segment will weigh over 300 pounds, and the eight, with the frame, will weigh nearly 3,000 pounds, which will give a compressive force of about 375 pounds for every square foot of bearing surface. This pressure, with the peculiar form of the segments, will render this roller a most effective clod-crusher

A Mink or Rat-Trap.

Although vermin may be kept out of a poultry-house by constant watchfulness, yet in

Fig. 1.—SECTION OF MINK-TRAP.

an unguarded moment their greater perseverance will frequently get the better of our care, and accidents will happen. It is therefore well to use traps occasionally, to kill off vermin, notwithstanding we may believe our

poultry-houses effectually guarded. A successful method of trapping marauding animals is here shown. Against the usual entrance to

Fig. 2.—LOWER PART OF THE TRAP.

the house, which is left open for the purpose, there is placed and fixed inside a box, from which the end has been removed, and from the top of which a piece has been cut, as represented in fig. 2. A steel-trap is set in this box without any attempt at concealment. Boldness in this case is the most successful plan.

Fig. 3.—BOX FOR THE BAIT.

Above the hole in this box is placed a smaller box provided with a false bottom of laths, an inch apart, shown at fig. 3. A chicken is put into this box. The consequence of an attempt to take the chicken, by a nightly prowler, whether cat, dog, mink, rat, or skunk, is readily foreseen.

Kilns for Burning Tiles.

After tiles have been molded by means of any of the machines, designed for that purpose,

Fig. 1.—KILN FOR TILE-BURNING.

and partly dried, it is necessary to roll and straighten them. This should be done, because in drying many of them will become warped and crooked, and a secure drain cannot be made with ill-shaped tiles. A thick slab of stone or hard wood, should be procured, and a smooth hard wood stiek, a little smaller than the inside diameter of the tiles. The stick is put through the tile, which is then gently rolled back and forth upon the slab, until it is straightened. If the edges of the tile need trimming, this should then be done, so that a close joint may be made. After a little more drying, the tiles may be baked, or if the fire is carefully started in the kiln, they may now be baked at once.

There are various styles of kilns or ovens for burning tile, but for the purposes of the small manufacturer, who needs to burn not more than 100,000 in a season, the forms of kiln and oven here shown, will be suitable and very cheap. That of which a section is shown in fig. 1, may be built for \$40 or less. It consists of a circular wall of beaten clay, 7 feet high, 4 feet thick at the bottom, and sloping outside only, to 2 feet in thickness at the top.

This wall forms a round structure 11 feet in diameter. Outside of it is dug a trench, from which the clay may be taken to make part of the wall, 4 feet wide at the top, narrowing to 18 inches wide at the bottom, and 3 feet deep. This is seen at *a*. From this trench there are three fire holes dug, one of which is seen at *b*, communicating with another trench inside the walls, seen at *c, c*. This trench is bricked over, and has three flues passing from it into the floor of the kiln. These flues are shown at *d, d*. Brick-work fire places are built in the fire holes, with fire bars or grates in them for the fuel, and doors or dampers of burnt clay or cast iron, should be provided for them. Either coal or wood may be used to heat the kiln. A doorway is made through the wall, through which to carry the tiles. This door may be bricked up when the kiln is filled. A rough shed should be built over the kiln, high enough to be secure from the fire, for protection against the weather.

The tiles are placed in the kiln upon their ends, lest the weight of the upper tiers should crush the lower ones. The small tiles are put inside of the larger ones, to save space as much as possible. In placing the tiles, narrow lanes are left between them, radiating from the flues from the fire places, and these are broken in each tier, so that the flame and heat from the fire, shall be made to strike every tile. With proper care in filling the kiln, a more even burning will be made, and there will be but few imperfect tiles. There are two dangers to avoid, one is under baking, and the other is over baking. It is well to have two or three test holes made in the walls, and to lay a tile opposite each hole, so that it can be lifted out on the end of an iron rod and examined, and the fire regulated accordingly. There should be one test hole for each fire hole, or for that part of the kiln subject to each fire hole. These holes are closed with a piece of soft clay. When not sufficiently burned the tiles are soft, of a pale color, and will not ring clearly when struck together. Such tiles should never be put into a drain, or if used should be put by themselves at the head of a drain, and never where their failure would stop a current of water. In a year or two, or perhaps less, they will crumble down, or flake off until they are destroyed. Perfectly burnt tiles are bright red in color, and ring clearly when struck. When over burned they are glassy, brown or black in color, deformed in shape, cracked, and run together in masses. For profitable results, therefore, the important business of burning should be cautiously and carefully done. The

Fig. 2.—PERMANENT TILE-KILN.

fire should be started gradually. If the tiles are damp, they should be warmed up slowly, and the fire should not be given headway for

two days. It should then be kept steady until the burn is complete, when the fire holes should be luted up with clay, and the kiln allowed to cool gradually. Fifteen days are sufficient to fill a kiln, burn the tiles, cool off, and empty it.

Figure 2 shows an oven which is more economical of fuel, than the one just described, and which may be kept more under control. It is also a more permanent structure. It is an arch of brick-work, 14 feet long, 8 feet high, and 11 feet wide in the clear. The wall may be built one brick-length, or 9 inches thick, and should be supported by buttresses, as shown in the illustration. It may be built half this thickness, if supported by 4 inch iron bands, 3 feet apart. The bands should be secured to stones in the foundation of the wall. Fig. 3 shows

Fig. 3. GROUND PLAN.

the ground plan of the oven. The chimney is placed at one end of the arch, at *a*; *b* is the body of the oven, *c, c, c*, are three fire places, 18 inches wide, 12 inches high, 30 inches long, and made 9 inches below the surface of the floor of the oven. From these fire places, flues 9 inches deep are made in the floor of the oven, converging toward the chimney. The chimney space is about 16 inches square, and vents are made in the wall, to communicate with the chimney space. A door, *d*, fig. 2, is made in the front of the oven, through which the tiles are put in, and when filled, an open wall of loose bricks is built up in front of them, and over the ends of the fire holes, to protect the first courses of tiles from the full force of the fire, and to spread the heat regularly through the whole mass. This wall is shown at the dotted line, *e, e*, fig. 3. A quantity of bricks set upon end are placed upon the floor of the oven, and the tiles are ranged upon their ends upon the bricks, the small ones inside of the large ones, as previously described. It is necessary to place the tiles so that the fire may reach every one, and yet that space may be economized. The success of the burn greatly depends upon this.

Tobacco in the Connecticut Valley—Special Crops.

In a recent trip up the Valley of the Connecticut, from its mouth to St. Johnsbury, we noticed the diminished size of the tobacco fields in Connecticut and Massachusetts. This is attributed to the low price of the weed, the lateness of the season, and the difficulty of getting plants to set. It is estimated that less than half the usual area is planted with tobacco the present season. There has been an over-production in past years. Tobacco in former years paid so largely that the area devoted to it on each farm has gradually increased, and new competitors have each year crowded into the business. We saw the evidences of the extent of the business in the new and large tobacco sheds and drying barns, and in the boxes and bales at the depots. The tendency of this and other special crops, we think, is not favorable to good farming. The tobacco grower concentrates all his energies upon this one crop. The few acres devoted to it of course are enriched, but as a rule all the rest of the farm is robbed to sustain the tobacco field. No brute will eat tobacco, and no manure from the crop, but the stems, goes back to the field. The

dairy dwindles, and the meadows yield diminished hay crops. Less and less manure is made, grain is not cultivated, no beef or pork, sheep or lambs, are reared or sold, and nothing of importance is sold but tobacco. Fertilizers are purchased—stable manure from the cities, and fish-scrap from the oil factories upon the coast, but nothing receives the benefit of the manure but the tobacco field. There may be exceptions to this rule, but there can be no doubt that this is the general tendency. This appropriation of capital and labor to a crop that has no alimentary value, of course affects the household markets in all the cities and towns in the region. Food is unreasonably dear. The acres that ought to be growing fruit and vegetables for human sustenance, are grazing the tobacco worm, and farmers are laboring to check its depredations. The meadows where cows should graze, are growing barren for want of manure, and those who live in the villages of this valley are paying an average of about eight cents a quart for milk. The pastures that might be kept in good heart perpetually with sheep, run up to brush and briars, and the dwellers there pay twenty-five cents a pound for lamb, and go without mutton six months of the year. The orchards are running out, and they import apples by the carload every year into a region entirely congenial to this fruit. With every facility for market gardening and truck farming, they empty long trains from New York, burdened with the products of Delaware and New Jersey soil, and pay big prices for the privilege. This may be economy, but we are not able to see it. We want well cultivated farms, as a means of giving the towns and villages cheap and wholesome food in great variety, and any special crop that defeats these ends is to be deprecated.

Wooden Hangings for Barn-Doors.

M. O. Barton sends us drawings and a description of the wooden hangings of his barn-doors, which have been in use for three years, and which, he thinks, are greatly preferable to iron ones. The rollers are turned out of a piece of seasoned hard maple, 4 inches thick; they are 4 inches in diameter, $\frac{3}{4}$ of an inch thick, and the axles are an inch thick, and $\frac{3}{4}$ of an inch long. They are shown at *a* in fig. 1. The track *b* upon which they run, is of hard timber, dressed perfectly smooth and straight, $2\frac{1}{2}$ inches wide and 2 inches thick, and is bolted to the girt, *c*; *d* is the edge of the boarding of the barn, upon which the track is made to rest. Ribs, *e, e*, are nailed firmly to the track, making a groove, in which the wheels run. These

Fig. 1.—SECTION.

ribs are $\frac{3}{4}$ of an inch wide and $\frac{3}{4}$ of an inch thick. The top cleat of the door is $1\frac{1}{2}$ inch thick and 3 inches wide, with grooves cut the thickness of the wheels, or half the thickness of the cleat, and inch-holes are bored through the rest of the thickness of the cleat, to receive the axles of the wheels. This cleat, in which the holes and grooves are cut, is shown at *f, f*.

A strip, $\frac{3}{4}$ of an inch thick, is then bored with one-inch holes, to receive the other ends of the axles, and is nailed firmly to the cleat of the door. This is seen at *g, g*. The door itself is shown at *h*. Thus the wheels or rollers are inclosed in the upper cleat of the door,

Fig. 2.—CLEAT AND WHEEL.

and when well soaked in oil, and covered with tallow, as well as the grooves and holes, in which they run, they travel back and forth smoothly and noiselessly. Fig. 2 shows the section of the wheel from above; *a* the cleat of the door, in which the groove and hole are seen, and, *b*, the strip nailed to it; *c* the wheel. The door is covered with a cap to protect the hangings from the weather, as in fig. 1.

Inspection of Butter.

Beef, flour, and pork are inspected, and the inspector's brand gives each a standing and character in the market, that is a guarantee of value to the purchaser, and a surety to the packer that he is getting whatever price the grade of his product deserves. But the dairyman labors under a disadvantage. If he makes a most excellent article, it is classed in the market according to its locality, and if the reputation of the locality is not equal to the intrinsic worth of the article, he gains nothing for his extra care and skill, and gets only the current price for the class of butter to which his shipment belongs. Thus if Western butter—as an unsavory reputation in the Eastern market, a shipment from a Western dairyman, unless he has already made a reputation for himself, is sold as Western butter at the regular quotations, which, as we write, are 10c. a pound below those for the product of New York State. Yet the best butter we ever tasted was from a Western dairy. Indeed we ourselves have had the mortification of having butter sold in the New York market, at several cents a pound less than we could readily get at home for it, because it was not from the State of New York, although when afterward put up in "Orange County pails," it could be as easily sold, when its quality became known, as Orange County, at the highest rates going for that class of butter. A large dealer once told us, that he would touch nothing that was not from Orange County, N. Y. Now all this is an injustice to other dairymen, and really amounts to a premium upon carelessness and poor quality. Why should not butter be inspected and sold upon its merits, as first, second, or third quality, and why should not a Western dairyman, who may have equal facilities and skill with an Eastern dairyman, be as well paid for his product? In short, why should not the dealers in the New York market, sell all good butter for the same price, irrespective of the locality in which it is made? It is well known that they do not, and that an unwarrantable and unjust discrimination is made against Western butter, simply because it is Western. There is now a Produce Exchange in New York, in whose power it is to remove this ban upon butter that is foreign to Orange County, or those chosen places, which it is the custom to include in that elastic appellation, and to put it squarely upon its merits. We bring this matter to the notice of the Granges, that through them such a pressure may be brought to bear upon the dealers, as shall force them to do equal justice to all their clients, whether

they happen to live in New York, Ohio, Indiana or Michigan. As good butter may be made in any one of these States, as in another, and while we point out this fact, we would impress upon our Western readers the necessity of bringing up the quality of their product, so that when it comes to be graded upon its merits, by competent and disinterested inspectors, it shall rise far above its present low estate.

Cider and Cider-Vinegar.

To procure either cider or cider vinegar of the best quality, care and skill are required in the manufacture. Some too economical persons, thinking that nothing should be wasted, are now engaged in gathering all the wormy and defective apples that fall from the trees, and consigning them to the cider-press. As new cider this questionable liquid is sold to the unsuspecting consumer for fifty cents a gallon. It however bears no comparison with cider that is carefully made from sound apples, and can not be made to produce a well-flavored vinegar. It would be better economy to feed all such apples to the pigs, for the first requisite for good cider or vinegar is sound fruit. All bruised, wormy, or defective apples must be discarded, if perfection is desired in the product. The next consideration is the mill and press, and the method of using them. In districts where timber is plentiful, and the necessary mechanical skill can be had, an improvement upon the old-fashioned mill and press is probably the best machine that can be procured. It is made wholly of wood, and no iron comes into contact with the crushed fruit. The timber should be sugar-maple or birch. These are free from the tannic acid, which renders oak objectionable, and stand wear and tear sufficiently well. The crushers are made of solid blocks, carefully seasoned under cover, so that they are free from cracks. They should be about 18 inches in diameter, and about two feet long. They should be turned perfectly cylindrical in a lathe, and deep, broad grooves cut lengthwise in them, so that the teeth of each, which are left projecting, fit accurately into the grooves of the opposite one. Four inches wide and three deep is a proper size for the grooves. This work should be done by a millwright, or a carpenter used to doing mill-work, as it is a somewhat difficult job. Upon the perfection of the rollers or crushers, the yield of cider greatly depends, as the apples must be reduced to a pulp, before all the juice can be pressed from them. The rollers are furnished with axles, also accurately turned, and are fitted into a frame, which is shown in fig. 1. This frame consists of a strong bottom of plank, four inches thick, preferably of maple, closely jointed and matched together. This is raised about 20 inches from the ground, upon a stout frame, and is pinned fast to heavy posts, set a few inches in the ground, so as to be immovable. A raised border is placed around the bottom planks. A cross-frame is built across the center of the bottom, into which the axles of the rollers are fitted, and to which they are secured by short blocks, pinned or bolted to the frame-work. The lower axles of the rollers fit into holes made in the bottom planks. The axle of one roller is lengthened, and attached to a horizontal arm, to which the horse may be hitched. A hopper is built at the rear of the crushers, to receive the apples, and feed them to the crushers. Fig. 1 sufficiently explains all other details. The press is shown in fig. 2.

It is an improvement upon the old-fashioned heavy press, which is made from the trunk of a large tree, and frequently required the trunk of another large tree as a support for it, and which

channel, two inches wide, and one inch deep, is made to the front, to carry off the juice as it flows. A piece of board is laid over this channel, and the floor of the press is covered with

several excellent cider-mills manufactured by different parties East and West, which are convenient for those who have but few apples, or who have enough to keep one hand-machine going. One of these, known as the Keystone Cider Mill, is an excellent one. We have made cider and vinegar of a very light color in one of these mills, as the pomace is exposed to the air only for a moment, as it falls from the grinders, and it is passed immediately under the press. No straw is needed in using a press of this kind. When the juice is safely in the barrels, it needs close watching during the fermentation. It is best to keep the bung-hole covered, to exclude insects and the air. For this purpose a perforated bung is useful, in which a glass tube, an inch in diameter, (fig. 5,) may be inserted. The tube, 12 inches long, may be kept filled, which will prevent any access of air into the barrel. When the cider is to be kept for a length of time, this course is advisable. After fermentation has stopped, which may be seen by observing that gas no longer bubbles up and escapes through the glass tube, the cider should be carefully drawn off into fresh, sweet casks. The barrels should then be stored away in a place where the

Fig. 1.—CIDER MAKING—CRUSHING THE APPLES.

is weighted at the end with a clumsy screw, a foot in diameter, and a ton of stones in a huge box. If any person supposed all this huge weight saved labor, he was greatly mistaken, because before a pound of pressure could be exerted upon the pomace, the whole weight of beam, screw, and stone

Fig. 3.—BOX.

must be raised. In this ancient machine the weight, which causes the pressure, is raised, while in the one here illustrated the pressure is brought to bear directly. The immense weight of the old press is, therefore, not only useless, but a hindrance. It is needless to give any description of what is so clearly shown in the engraving, further than to state that the material of the press is similar to that of the mill, and that the screw may be of wood, preferably of beech, but is better, and in most cases cheaper, of iron. The screw should be lubricated with hard tallow, ground up smoothly with black lead. As the apples are ground, the pomace should be put into the press immediately, if light colored cider or vinegar is desired. If a deeper color is wished for, it can be procured by exposing the pomace in the mill to the air, while one batch is pressing. A wooden scoop should be used to lift the pomace. No iron should touch the crushed fruit or juice during the process, if excellence is wished for. In building up the "cheese" in the press, it is better to use a small square frame of boards in the center, by which an interior space is left in the mass of pomace, through which the juice is expressed more readily, than if the mass were solid. The use of this small frame will obviate the necessity of a second pressing. The frame, fig. 3, is placed in the center of the press. From this center a

clean, straight rye-straw, leaving the ends projecting at each side, which have to be turned over the first layer of the pomace. This prevents the pomace from being squeezed out when it is pressed. When the first layer is finished, and the straw is turned upon it, it appears as in fig. 4. This process is repeated, until the press is full, when the pressure is applied gradually, so as not to burst the cheese. The juice runs through a filter of cut straw into a vat, from which it may be dipped or pumped into the barrels. It is well to have a strainer of hair-cloth in the funnel, or across the mouth of the pail, as the barrels are filled. In all these processes the utmost cleanliness should be

temperature is even, and the bung-holes tightly closed. If it is intended for vinegar, empty vinegar-casks may be used. The bung-holes should be left open, and kept covered with a piece of fine wire gauze, so as to admit the air. After a time the vinegar will make, and should be again drawn off into clean casks, without disturbing the sediment. If the sediment should become disturbed, the

Fig. 4.—THE CHEESE.

observed, if a good product is wished for. For those who find it more convenient to use a manufactured mill, that known as Schenck's Apple and Grape Grinder, which is able to grind 200 bushels per hour, may be desirable. There are

vinegar is never perfectly clear afterward. To make vinegar from cider in the most rapid manner, the building must be heated to about 70°, and the liquid frequently exposed to the air, by drawing it from one cask to another.

Fig. 5.

The Broad-leaved Acanthus.

Within a few years the taste for plants with handsomely formed and stately leaves has much increased. We do not now refer to leaves attractive for their color, but to those of

high, are white or lilac, each in the axil of a large leafy bract. The only plant of this we have seen is one which Messrs. Olm Bros. received with other things, and treated as a greenhouse plant. As far as can be judged from a specimen grown in a pot, the European ac-

The stem is one to two feet high, and bears at the top a large, much divided, panicle of small rich crimson flowers. The plant is as yet little known in this country, but at the Exhibitions in England, this summer, it has attracted much attention, and received high commendations.

THE BROAD-LEAVED ACANTHUS.

marked outline and habit. Plants of this class are for convenience called sub-tropical, though many of them are not natives of warm climates—sub-tropical being a convenient term for that style of gardening, which depends upon beauty of form rather than color for its effects. Among the plants that have come into prominence for this use are several species of *Acanthus*. This name is the Greek word for thorn slightly modified, some of the species being very thorny; and we are quite sure that the greatest stickler for common names will prefer it to "Bearsbrech," the name given to one species in England. The Spiny Acanthus (*A. spinosus*) is the plant that is said to have suggested the idea of the ornamentation of the Corinthian capital; the story goes, that Callimachus, the architect, was in great trouble how to finish off the capitals to his columns, and as he was pondering upon the matter in the garden, his eye fell upon a jar, around which Acanthus leaves had grown in the most graceful manner. The largest and finest of all the species used in European gardens, is called *A. latifolius* and *A. Lusitanicus*, but it is probably a variety of *A. mollis*. It is a fine, bold plant, with dark green leaves of pleasing outline, as shown in the engraving. It is said that well established clumps of this form a dense mass of fine foliage three feet high, and five feet across. The flowers, which are upon a long spike about five feet

counts are not overdrawn. It is perfectly hardy in England, and we hope it may prove so here, as it is a fine plant for the decoration of large gardens. Only two or three days before his sudden death, the elder Mr. Olm came to see us in reference to the specimen, which he had sent us for the purpose of engraving.

The Palmate Spiræa.

There are certain genera of flowering plants so large already, that we always dread to see a new species added to the list. This is the case with *Spiræa*, of which there are more than one cares to keep the run of, and with the shrubby ones at least, half or more of the list might be dropped out of cultivation without detriment. Therefore, when we saw the *Spiræa palmata* announced in the foreign journals as a new acquisition from Japan, we did not feel very enthusiastic over the matter, notwithstanding all the praise bestowed upon it. Last year we received a plant from Mr. Chitty, of the Bellevue Nursery, Paterson, N. J., and are forced to admit that it is a valuable addition to our garden. This is not a shrubby species, but a herbaceous one, that reminds us, as to its foliage, of the old "Queen of the Prairie," *S. venusta*. The leaves, as its specific name indicates, are palmately-lobed, and the lobes are sharply serrate.

THE PALMATE SPIRÆA.

With the Queen of the Prairie *Spiræa*, and others related to it, the trouble is that the flowers in the cluster open unevenly, so that by the time the outer ones in the panicle are well opened, the central ones have already dropped their petals, and taken on a seedy look. Whether this will happen with the Palmate *Spiræa* we cannot say, as our only flower-cluster was sacrificed for the sake of an engraving. We have no doubt that it will prove hardy here, as our plant stood out all last winter without protection, and came up strong this spring.

Onions Sown in Fall for a Spring Crop.

BY PETER HENDERSON.

It has long been a practice with market gardeners in the vicinity of New York, Philadelphia, and other large cities, to plant onion sets in spring for an early summer crop. These are sold in bunches in the markets in the green state; the sales are usually begun in this neighborhood about the first week in June, when they are only half grown, and continue to the middle of July. Onion "sets" have of late years been advancing so in price, owing to the increase in price of labor, that our market gardeners find that it hardly pays them to any longer buy their sets, and they are beginning to resort to another expedient to procure an

early crop, which is to sow the seed in the fall, winter over the young onions, or sets, in the ground, and allow them to continue their growth the next spring. This plan is not a new one, it being frequently followed in England, but in consequence of the severity of our northern winters, causing occasional failure, it has almost been abandoned.

But now, in view of the high price of "sets," it is again being resorted to, more care being observed to protect the young bulbs in winter. It is not easy to say, without some experiment, at what is the best time for sowing the seed, and the safest method will be to dry different dates, until it is seen which answers best. For this section, near New York, I would recommend the first, fifteenth and thirtieth of September. The ground should be prepared in the usual way, as if for sowing in spring, giving it thorough pulverization and manuring. The seed should be sown with a seed-drill, at distances of one foot between rows; this would take about 3 to 4 lbs. of seed to the acre. The kinds that prove hardiest are the red and yellow varieties. The soil must be thoroughly drained, either naturally or artificially, to prevent "heaving out" in winter. A Long Island market gardener informed me that even at the very low rates that green onions have brought the past summer, his fall sown crop netted him over \$1,000 per acre, the product in number of bunches being more than double that usually obtained from the planting of sets in spring. He sowed in a warm sheltered situation on rather light soil about the middle of September, thoroughly hoeing and weeding, so that he had a fine growth by the end of October. In December, before severe frosts had come, he covered the whole space between the rows two or three inches deep with leaves from the woods, choosing a day when snow was falling, so that the leaves were pressed down by the snow and prevented from blowing off. If the services of the snow could not be made available, branches thrown over the leaves would answer the purpose. When leaves are not at hand, salt or marsh hay, straw, or corn-stalks, would answer nearly as good a purpose, the object being to protect the crop from the severity of winter, as it is not sufficiently hardy to stand in our latitude without such protection. In all sections where the thermometer does not fall lower than 15 degrees above zero, such protection would be unnecessary. I would advise those residing in very cold localities, to experiment first with a small lot, until it can be ascertained whether they will winter over even with the protection of leaves or straw.

The Hollyhock Fungus—Cotton in Danger.

This disease among hollyhocks, which has spread in Europe with fatal activity, has already been briefly noticed. But little is known about it, save that it came from South America, and that it appears suddenly in widely separated districts, and causes the death not only of hollyhocks, but other plants of the Mallow Family. The disease shows itself in small spots upon the leaf, which, when magnified, are seen to be groups of minute fungi. The engraving here given, reduced from one published in a recent number of Gardener's Chronicle, shows the spots as they appear upon the leaf (A) of the common Round Mallow (*Malva rotundifolia*), and the fungus largely magnified. The long horn-like projections (B) are the hairs upon the mallow leaf. The spread of this pest seems to

be mysterious, it appearing at once in all parts of a large plantation; and yet Prof. W. G. Smith has entirely failed to propagate it, although he has wrapped the diseased leaves around the stems of healthy hollyhocks, and buried others in the soil at the root of the plant; this failure may be accounted for by the fact that the spores were not yet ripe and ready to germinate. Thus far no application of sulphur, or other fungus destroyers, have been of use, and the only known remedy is to root up every affected plant.

The venerable Mr. Chater, a distinguished florist, who has devoted half a century to the improvement of the hollyhock, and to whom we are indebted for the present perfection of the flower, may well be despondent at the loss of the favorites he has so long cherished. While this disease prevails, no malvaceous plants should be imported to this country from England or the Continent. Our importing florists should bear this in mind, and let all the new varieties of Abutilon, Hibiscus, and everything else of the Mallow Family, remain with the ocean between them and us. This warning should be heeded, for if the fungus is once introduced, it will no doubt prove a greater enemy to the cotton crop than all of its insect enemies together. As it, so far as known, attacks all of the Mallow Family indiscriminately, there is every reason to believe that cotton will prove no exception. Its introduction would be a national calamity, and one that can not be too zealously guarded against.

HOLLYHOCK FUNGUS.

Rose-Growing in Winter—Conflict of Opinion.

BY PETER HENDERSON.

The matter of growing Roses for winter-flowering is now engrossing much attention, and I have more than once written upon it in the columns of the *Agriculturist*; but the subject is now getting to be of such general interest in every section of the country where there are greenhouses, that anything that will tend to a further knowledge of the subject will, I know, be read with interest by many hundreds of your readers. There are three different systems in use; first, that of growing the plants in large pots, or tubs; second, planting out on prepared solid borders of soil, from 1 to 2 feet in depth, and another by planting out on raised benches or tables, in 6 or 7 inches of soil. Each of these systems has its advocates, who claim that one or the other is the best, and the novice in rose-growing (and it must be remembered that we have hundreds beginning every year) is puzzled to decide which system to adopt. I have tried them all with fair success in each, and have come to the conclusion that, taking

all points into consideration, particularly where Roses are not grown exclusively, but only form a part of the general stock, that the plan of planting out on raised wooden benches, in 6 or 7 inches of soil, is the most profitable. I am now preparing the center benches in two of my largest greenhouses, making a space of 600 feet long by 8 feet wide, or nearly 5,000 square feet, whereon to plant Roses. The plants used will be those struck from cuttings last February, and grown on in pots, so that by September they will be plants from 12 to 18 inches in height. The soil in which they will be planted is now being prepared, and consists of 6 parts thinly cut sod, from a rather heavy soil, to this is added 1 part rotted cow-stable manure, and 1 part sandy lime rubbish and oyster shells, all thoroughly chopped up and mixed together. The grassy fiber may hardly be decomposed before we use it, but that will matter but little, only it will be necessary to cover this compost when placed on the bench with an inch or two of soil, so that any of the sod roots that may be alive will be unable to grow through it. This soil will not be put on the benches before the middle of September, when the Roses, already prepared, will be planted about 12 or 15 inches apart. We shall use about 4,000 plants, which will be apportioned in number, as far as our knowledge goes of their merits, thus:

1,250 *Bon Silene* (deep carmine); requires the warmest part of the house.

1,250 *Safrano* (saffron yellow).

750 *Isabella Sprunt* (canary yellow).

250 *Douglas* (purplish crimson); requires the coolest part of the house.

250 *Duchess de Brabant* (salmon and rose color).

100 *Bella* (pure white).

100 *La Nankin*, new, (lower part of bud orange yellow, upper part pure white).

50 *La Jonquil*, new, (clear golden yellow).

Should no accident occur, we anticipate that this number of Roses so planted will average us 3,000 rose-buds per week from October 1st to June 1st. I need not detail here the after-treatment, that having already been fully done in my previous articles, other than to briefly say that a night temperature of from 55° to 65° must be steadily maintained, with a day temperature of 15° or 20° higher. The plants must be freely syringed at least once a day, but watered at the roots only when dry, and then freely.

This method of planting roses on raised benches necessitates their renewal at least once in every two years, as the soil in which they are grown becomes "washed out" by the frequent waterings; we ourselves intend to renew the soil every season. The roses planted in September will be flowered to their fullest extent during winter, until the first of June. Each plant will have then formed a mass of fibrous roots, so matted that the soil is held by them, and which can be lifted by passing a spade under them; when these are potted in pots or tubs suited to the size of the plant, no check to the growth is given. We lifted in this way from benches the past season roses which were four feet high by as much in diameter, planted them in pots 15 inches wide, with hardly the loss of a leaf. By lifting every season in June, the plants can be set out-doors, and the whole care of watering and syringing the greenhouse can be dispensed with for the three hot summer months; this is a matter of very great importance, for in most locations there is never water enough, and even if there is, unless it is unremittingly applied, the roses are certain to

be seriously injured during summer. To be sure, the labor of taking up the plants and potting them, and removing the old soil in June, and again replacing with the fresh soil in September, is a good deal of labor, but not half that of caring for the roses if they are kept under glass three months in summer, to say nothing of the unquestionable advantage of their having fresh soil to root in when again planted in September.

I have said that I consider this plan most profitable, particularly where roses are not grown as the exclusive stock. One reason for this is that the space under the benches can be utilized for many purposes. If the main angle of the greenhouse faces south, as ours does, we find that a bench placed on the south side under the main bench (which is 3 feet above the path and 7 feet from the glass at its highest point), about half way between the bench and the ground, can be made as available for many purposes as the benches or tables exposed to full light. Our lower benches are 18 inches wide, with a board behind wide enough to prevent the dry air from the pipes injuring the plants. On these underneath benches we have grown during the past season Ferns, Lycopodiums, Cape Jessamines, Irises, and all plants which naturally grow in the shade, and in spring, when these were disposed of, have again used this under space to sprout Sweet Potatoes, Dahlias, and Tuberoses. The space under the benches is usually only used by placing the plants on the ground floor, without any protection from the heat radiated from the pipes, and in consequence they soon present a wretched appearance; but when regular benches are constructed, as above described, the plants of the kinds suited to such treatment can be grown nearly as well as those exposed to direct light. It will be seen that this economy of space is of great importance, as it gives just so much more bench room, with no more cost in the labor of firing, of fuel, or of construction of the building. The under bench room used by us now is upwards of 10,000 square feet. If we used all solid benches on which to grow our roses, or other plants, this room would not be available. These wooden benches require to be replaced every 6 or 7 years, but their cost is nothing when compared to the saving made by using the space underneath.

Preserving Flowers—Winter Bouquets.

SECOND ARTICLE.

Last month, in giving an account of the method of preserving flowers by the use of sulphur fumes, a much older process was alluded to—that of preserving them by sand. This method has long been in use, although those who have practiced it have made a secret of it. At the Exhibition at the New York Crystal Palace, over 20 years ago, there was a case of flowers preserved in the greatest perfection, which attracted much attention. The writer at once guessed how the flowers were dried, and experimented sufficiently to show that his conjecture, that they were treated with sand, was correct. In drying flowers in this manner, they must be carefully surrounded by perfectly dry fine sand, in such a manner that they will hold their form, the pressure of the sand upon both surfaces being alike. Any fine clean sand will answer; it should be sifted to remove all coarse particles, and then washed in successive waters, until dust and all earthy and clayey matters are washed away, and the

last waters when poured off are perfectly clear. The sand is then to be dried, and then placed over a fire in a proper vessel, until quite hot, hotter than the hand can bear; and when cool it will be fit to use. After heating it should be used at once, before it can absorb moisture from the air. The vessel in which the flowers are to be dried, is of little importance where there are but few. We have had good success by taking a clean, thoroughly dry flower-pot, the hole in the bottom of which was stopped by a cork. This was filled a third full of the dry sand; the flowers set carefully in the sand, and then more sand slowly added, so as to surround and cover the flowers inside and out, and set in a warm place. At the end of 24 hours the cork was removed from the hole in the flower-pot, and the sand allowed to run out in a small and gentle stream. The flowers were left in the pot, perfectly dry. For operating upon a large scale, a box should be made or fitted for the purpose. A box with a sliding cover answers a good purpose, the bottom being taken off, and the sliding cover turned down to form the bottom. An inch or so from the sliding bottom there is placed a frame, upon which is tacked wire gauze of sufficiently large mesh to allow the flower-stems to be placed in it. If wire gauze is not at hand, a net-work of twine, or whatever else will answer the purpose, may be substituted. The box is to be filled with sand up to the level of this wire-gauze or other partition. Then flowers are to be placed in natural position, but not touching one another, and carefully surrounded by sand within and without. We have found a paper-funnel with a fine point, which lets the sand flow in a small stream, very convenient in this part of the work, as upon the care with which this is performed, will depend the shape of the flowers when dried. Often more than one layer of flowers may be placed in the box, the object being to have each one surrounded by a sufficient quantity of dry sand, to rapidly absorb all the moisture the flowers contain. All bell-shaped, funnel-shaped, and double flowers should be placed upright, and the sand so filled in, that they will not be crushed by pressure from without, or distorted by the sand within them. Flat or wheel-shaped flowers, like those of the Phlox, for instance, should be placed face downward. A little practice will enable one to find the proper position, it being borne in mind, that the object is to have the parts of the flower completely surrounded by sand, and still retain their proper form. It should be remembered that the flowers must be perfectly dry when gathered, as any dew or other moisture will cause them to become spotted and spoil. The flowers having been placed in the sand, and a layer of sand put on top, the box or other vessel is then to be set in a warm and dry place, such as back of or under a stove, or wherever there is a gentle heat. Those who have a greenhouse, will find the upper shelf, just below the glass, a suitable place. After the flowers have been in the sand for 18 or 24 hours, they may be taken out. The sliding bottom of the box is opened to let the sand run off gradually, and the flowers will be found dry and in their natural shapes and colors upon the partition of wire or other material. The flowers are now exceedingly fragile, and need the most careful handling. They must be taken up carefully, one by one, and if any sand remains, which does not fall off by gentle shaking, it is to be removed by brushing with a soft camel's-hair pencil; they are then put away in a box or drawer, where they will be free from

dust and dampness. Some prepare the sand after it has been washed and dried, by melting stearine with it. To three quarts of sand is added half an ounce of stearine (such as the hard or "star" candles are made of); the sand is placed on a stove in a glazed earthenware vessel, and when hot enough to melt it the stearine is added in small pieces, and the sand thoroughly stirred, the object being to coat each grain with a minute film of stearine. The use of stearine is to prevent the sand from adhering to the flowers, but if it has been properly washed, sifted, and dried, there is but little trouble. Almost all flowers may be dried in sand, but white ones have a yellowish tinge.

Florida Air-Plants—Epidendrums.

One who for the first time visits a fine collection of stove, or hot-house plants, is struck by the Epiphytal orchids, which appear to one who sees them for the first time in his life, as something quite wonderful in plant life. These Epiphytes, which in the moist woods of their native tropics, cling to the branches of trees, have in cultivation their natural habit imitated, and in the collections are grown upon billets of wood, pieces of cork, and the like, to which their roots affectionately cling. It is indeed strange to see plants not only growing without any connection with the ground, but flowering and producing a profusion of always curiously shaped, and often beautifully colored flowers. All orchids are not Epiphytes, *i. e.*, do not grow upon trees, but those which do are popularly called "air plants," as their nourishment must come from the air and the rains. These beautiful plants of the finer collections, are generally from tropical countries, and from the difficulty of obtaining them, and their slow growth, they are among the most expensive of all plants. All Epiphytes or air plants, are not orchids, as there are ferns and other plants, which grow in the same manner, one illustration of which was given in the "Long Moss," described and figured in July last. The vegetation of Southern Florida approaches a tropical character, and there are found there a number of air plants, including two orchids. These orchids both belong to the genus *Epidendrum*, (meaning—upon a tree), and form large clumps, which are attached to the tree by means of their clinging roots. Through the kindness of our friend Dr. Lungren, we received living specimens of both these species this spring; the small leaved one (*E. conopseum*), has not bloomed with us yet, but the long leaved one, (*E. venosum*) has flowered abundantly. The clump was fastened by means of fine wire to a block of wood, first putting a little moss around the roots, and suspended from a rafter of the greenhouse. It has had a daily sprinkling, and has flourished as well as if it had been at home. The engraving, reduced in size, gives an idea of the manner of growth. The stem is swollen at the base to form a kind of bulb, above which are two leaves, 4 or 5 inches long; the flower stem, 12 to 18 inches long, appears from between the leaves. After flowering, one to several offshoots are formed at the base of the old bulb, each of which develop two leaves, and during the season the stem below them forms a bulb, in which is stored sufficient nutriment to produce a flower-stem another year. Numerous flowers are distributed along the flower-stem, which, though not very brilliant, are exceedingly neat and interesting. The flower, the shape

of which is shown in the engraving, is about an inch and a quarter across; its three sepals, and two of its petals are alike in color, being a greenish buff with darker veins; the third and lower petal, called the lip, is in this as in other orchids, quite different from the other two; it is three-lobed, the side lobes embracing the stamen and pistil, and the middle lobe much larger than the others, spreading and fan-shaped; this lip is pure white, with a broad carmine blotch upon its expanded portion, and a smaller one on the narrower part. Like many other orchids, the flowers of this endure for a long time. This native plant is one which can be easily cultivated in an ordinary greenhouse, and while not so brilliant as many of its relatives, it cannot fail to be of great interest on account of its manner of growth. So far as we are aware, our native species of *Epidendrum*s have not been offered by florists,

A FLORIDA AIR-PLANT.—(*Epidendrum venosum*.)

on land that has been held by actual settlers for a hundred years or more past.

During more than a century, the coal-burners have every few years swept down the forests, from one end of the State to the other, so were

have to contend against, is the larva of *Dryocampa senatoria*. The moth deposits her eggs in large patches, on the under side of the leaf, which soon hatch, and the young larvæ move along in a vast colony, devouring the leaves as

they go. Toward the latter part of summer, trees are often entirely denuded of leaves, and the disgusting larvæ seem to be everywhere present, on the lawn, in the garden, on the sidewalk, until one shudders at the very thought of even a walk, to say nothing of a seat under the oaks.

Another enemy is the Oak-pruner. This fellow would not be so very objectionable if he did not prune too closely, and had sense enough to know where the pruning was needed, but like some senseless

horticulturist, he slashes right and left, without any regard to beauty or symmetry, and down come the twigs, and sometimes quite large branches. The workman always falls with the

it not for these exceptional trees, we should not know, except by tradition, how large the white oak and some other species would grow. But now, alas! when we just begin to appreciate and realize, how truly beautiful these various species of oaks are, when we are laying out parks, and leaving groups here and there to beautify our village, we find they are preyed upon by at least four enemies—two vital ones, the Gigantic Borer (*Prionus laticollis*),

and the locust borer (*Hylctus robinie*). The former is the larva of the largest beetle in the Northern States. Fig. 1 shows the larva, and fig. 2 the beetle, both of the natural size. This borer attacks all the oaks, but seems to prefer the white oak, making its winding paths through the wood of the trunks of the trees, weaken-

ing them to such an extent that large trees are frequently prostrated by a strong wind. The locust borer at present threatens to become even more destructive than *Prionus*; it is the larva of a large moth, (*Hylctus robinie*) and has proven very destructive to the locust groves in the Western States; but with us its preference is decidedly for the oak—the black oak (*Quercus folcata*), and the allied species are its favorite haunts. Fig. 3 gives the larva, and fig. 4 the female and fig. 5 the male moth. This morning, June 30th, I found seventeen empty chrysalid cases protruding from the trunk of one small tree. They seem to be much more numerous this season than in any previous year. But the most disagreeable of all the pests we

perfect insect comes out to lay eggs for another crop, which it deposits in the axils of the leaves.—ED.]

but those who have friends who visit Florida in the winter, can readily procure them.

The Enemies of the Oak.

BY MRS. MARY TREAT.

The oaks of New Jersey seem to be doomed. "Small matter as to that," is the sneering retort. "Did New Jersey ever produce a sizable oak anyway?"—Well that depends upon what you call a sizable oak; it probably has never produced an oak quite equal in size to the gigantic Sequoias of California; but I have seen respectable oaks growing in New Jersey. In Atlantic County I have found larger

Fig. 2.—OAK-BORER BEETLE.

white oaks (*Quercus alba*), than in any Northern or Western State that I have visited. True, this is exceptional, and such oaks occur only

seems he has sense enough to look out for himself and fall with the twig. Out of many hundred freshly fallen specimens, I have never failed to find the culprit safely ensconced in the twig. It is the larva of some beetle, but I have failed as yet, to rear it to the perfect insect. [This is probably the insect, a small slender beetle, described in Harris' Insects as *Stenocorus (Elaphidion) putator*; the means of preventing its increase is to gather and burn the prunings before the

perfect insect comes out to lay eggs for another crop, which it deposits in the axils of the leaves.—ED.]

Vineland, N. J.

THE HOUSEHOLD.

(For other Household Items, see "Basket" pages).

A Corn Knife.

In October 1872, we published a description with engravings, of a corn cutter sold at the furnishing stores, which was indented for cutting the kernels of green corn, and pressing out their contents at one operation. This cutter worked very well, but being made to sell at a very small price, was a cheaply made affair. "O. H. A." of Winchester, Va., sends us a drawing of a corn knife, which we have had engraved. Mr. A., says:

"It is used to cut green corn from the cob, the same as the corn cutter, figured in October

HOMÉ-MADE CORN-KNIFE.

Number, 1872, and can be made by any person having a handsaw-file, and an old table knife. Take an old table knife, or a new one will do equally well, and cut out circularly with a cold chisel $2\frac{1}{2}$ inches of the edge: then file sharp teeth altogether from one side, so that the points will present a long cutting surface. Pass this edge a few times down the ear, then scrape it with the back of the knife, and you have all the kernels of corn out, with the hull left on the cob. Corn prepared in this way is very much more digestible, then when cut or eaten from the cob.

Home Topics.

BY FAITH ROCHESTER.

"MAMMA, COME AND SEE."—I had just written "Home Topics" at the top of my page, when I heard the familiar call, "mamma, come and see my house! Mamma, come and see my house!"

"Mamma has gone up-stairs, and she can not come now," said Auntie. And so the call was hushed for a few minutes, Auntie having given a few words of praise to the little house-builder three years old.

How much of my time is spent in going "to see"—flowers, wild and "tame," toads, frogs, snakes, beetles, worms, insects' eggs and larvae, pictures, maps of imaginary lands, block-houses and churches, and barns and pig-stys, and monuments, supposed to belong to the inhabitants of those imaginary lands, and other things "too numerous to mention"?

Does it pay?—It interferes with the order and promptness of housework, it hinders the sewing, it interrupts my reading and writing—the very little that I undertake to do in these busy days. Often I am so tired that I dread to hear the call, "come and see," and it is a real self-denial (as far as "the flesh" is concerned) to give up a moment's rest for a child's gratification.

But "the spirit"—the enlightened mother-spirit—is always willing to sympathize with a child's pleasure, and to encourage its happy activity and investigation. There is so much occasion for reproof and disapprobation in our intercourse with growing children in whom nature has a chance to assert itself and cut up capers, that we ought to seize every opportunity to gratify their innocent desires, and to listen to their fresh experiences, though they may seem trivial to a superficial observer. Children's experiences and observations are not unimportant, and parents who judge of them by the usual standard of grown-up experience, make a very great blunder. They "snub" the artless inquirers again and again, and wonder at last that their older children do not confide in them more. Is it any wonder?

It seems very necessary that the children should have their little garments kept clean and whole, and that the rooms should be swept and garnished

with regularity, and it hurts a housekeeper's feelings to have anything interfere with good house-keeping. But a true woman, who is blessed with children, lives more in her mother nature than in the disposition of a housekeeper; and in looking back over a season, she considers with more pleasure the progress her children have made in their general education toward a useful manhood, or womanhood, than any feats in the line of soap-making, fruit-preserving, or sewing. But it is like the tithe-paying and deeds of love—"These ought ye to have done and not to have left the other undone."

PARENTAL INFALLIBILITY.—I suppose there is nothing more silly than the attempt to appear knowing upon subjects where we are really ignorant. We are, all so extremely ignorant; or we have, each of us, even the best informed, so little

knowledge compared with the great sum of attainable knowledge, that any pretension of "knowing everything" is very absurd. If children are encouraged to ask questions about what they observe, they will puzzle the mother of average education very frequently. She need not be at all afraid or ashamed to answer, "I don't know"; but she ought not to let the matter rest there. She ought to show an interest in the matter, and to find an answer to the question if she can. I have not found that children lose respect for their parents on account of their ignorance. I have to confess ignorance every day, and it is all taken to be natural enough. The thing which interested children wonder at most in grown-up people is their lack of interest in natural phenomena. Nothing hurts them more than the contempt of older people for their investigations—and it is very cruel. No doubt Agassiz was considered a lazy boy by some industrious people while he was floating about in his boat on lake Neuchatel, looking down into the water to observe the habits of the fishes. No doubt he was thought a cruel boy when he was seen dissecting insects and other animals. No doubt he was called a "girl-boy" when he came from the woods with his hands full of wild flowers for analysis. Yet the whole world knows him now as a kind-hearted man, and his life is remembered as one of great industry and usefulness. It is fortunate for us all that his natural bent was not interfered with. Our little inquirers may never become "great"—I don't care a fig for that—but they have a right to the use and development of such faculties as they have.

THE CORNER-CHAIR.—In one of the early numbers of HEARTH AND HOME there was an illustrated description of a large corner-chair, such as any

Fig. 1.—SIDE OF CORNER-CHAIR.

carpenter could make, and any woman of "faculty" might upholster. By the aid of the description and illustration we made ourselves such a chair, but found it too large to move out of the room. So it went with the house when the house was sold. I

write now from the corner where that chair stands, and the youngest member of our family, aged two months, lies sleeping in the chair, his favorite daytime couch. I like to use it for baby's bed (or one of his beds), because the high back affords a good chance to throw a mosquito-net over him, out of the reach of his hands.

The chair is on castors, and may be moved to any part of the room, but its appropriate place is a corner—either a light and sunny corner, or one near the fire in winter. Its ample dimensions and cushioned sides make it a cozy place for an after-dinner nap. Two or three small cushions piled up in the back would often be useful with the chair, as they could be arranged to suit different postures. The covering of the chair may be of any suitable material—calico, if you choose, or velvet, if that suits your taste and purse better. The bottom, or seat, of our chair pulls off and reveals a box of two compartments beneath, where things not often needed can be packed away. These compartments are papered neatly inside, and a short groove under the seat-board on one side enables one to get hold and pull off the cover.

I forgot whether our chair was made exactly according to the measurements given in HEARTH AND HOME, but its size and shape suits us very well. Two broad boards, 30 x 46 inches, are cut in the shape shown in figure 1. The seat of the chair is shaped as though a square board, 30 x 30, had

Fig. 2.—BOTTOM OF CHAIR.

one corner, or triangle with a hypothenuse of 13 inches, cut off. A frame is made in the same shape for this seat to rest upon, at a distance from the bottom of 13 inches. The seat-board raises the seat an inch higher, the castors another inch, and the cushion two or three inches more. Another board, 30 x 30, with one corner cut off, like the seat, forms the whole bottom of the chair. Cleats are nailed on at the place indicated by the dotted line in figure 1, and the three sides of the front of the chair are boarded up.

HOUSEHOLD EXERCISE.—To many women the labors of housekeeping are quite attractive, especially if the houses they keep are their own. There is some dirty drudgery about the business, necessarily, though I think this will be lessened as machinery and neighborly co-operation come more and more into use. Work is a lessening as well as a necessity to the human family, but affairs are so mixed up at present that some people have too much of it, and some have too little, for the good health of either class.

Miss Alcott cannot afford to let a hired girl do the ironing, it is such rest to her own arms and hands when weary with writing. I found, not long ago, when living in another home than my own, that I was much healthier for having a part of the housework to do, though my own housework—the care as well as the labor—had been too much for my health at the time. As strength came back, its moderate use was the best way to increase it. Women, who have brain-work to do, will find it a good plan to perform some light household exercise before entering upon the writing or study. An easy walk out of doors may be better, but if there is housework to be done, that had better come in the morning, and the out-door work later in the day.

Dish-washing is good for dyspeptics. It is light exercise of the arms and chest soon after a meal.

and it may be done sitting as well as standing. A high office-stool is very useful in the kitchen. Feeble women, who do their "own work," often stand upon their feet more than is necessary. You can sit down to dress vegetables, to wash and wipe dishes, to knead bread, to iron, and to do many other things. You may be a little more slow about the work, but you will get through it in better condition. Housekeepers would often like to take an out door walk, only their "feet are so tired!"

Dish-washing would not be half so disagreeable as it often is, if the dishes were lightly scraped free from crumbs, and neatly piled up for washing. There should be a large dish-pan and plenty of hot water, with which to fill up the pan gradually as its contents cool. I seldom use soap for washing dishes, but to the unskilled, or to those who use much butter and fat in their cooking, it seems a necessity.

Sweeping is good exercise, if the floors and carpets are not dusty. Ah! that "if"! Bed-making will serve as gymnastics, if the beds are kept clean and well aired.

And what of washing? I do not think highly of the old-fashioned wash-board exercise. It is hard for both lungs and back. With good washers and wringers, and strong arms for the lifting, it may be made passable as exercise, and it is always a pleasure to see soiled things growing clean once more.

A moderate amount of ironing is good for women in health, in cool weather. On hot days the ironing should be done in a cool room, if possible. The ironing-table may be on a shady porch, or in the dining-room.

I really wish that every fashionable woman had to iron all her own washed garments for one month. She would then understand better the full meaning of the word "achy," as used by Mrs. Whitney to describe the puffs and ruffles on summer suits, putting together in her estimate of the cost of her garments the labor on the sewing-machine, and the hard laundry work. There are few women who have not wished, when doing up fine linen plaited shirt bosoms, that men could know by experience how difficult and trying the work is, until one has become skilled by practice. But cooking is perhaps the most important department of housework, and its exercise is not heavy in quality, though to some it may be heavy in quantity. It seems to me more and more like a high art, or dignified occupation, worthy to be called a profession—far more useful and honorable than—the legal profession, for instance. I should not wonder if really good and scientific cooks could do more to preserve and to restore our health, than the doctors of medicine can. As with ironing—the hardest kind of cookery is the least necessary, or the ornamental part. We should study to make our cooking work as little heating as possible. For instance, bread may be baked in the oven instead of cooking it upon the griddle in the form of "pan-cakes," and in hot weather we can avoid those forms of food that require constant stirring while boiling. A Warrener or a Rumford apparatus for cooking by steam diminishes the unhealthfulness of the cook's business, by confining the odors of the articles in course of preparation for the table. I hear, too, that there are ovens with glass doors.

If the family cooking seems laborious, study how you can simplify it without making the food less nourishing, or less attractive.

There is a great deal of necessary work to be done in the world, in order that we may all be comfortably clothed, and fed and lodged. I should like to see what would be the result if the labor and strength spent upon unnecessary work, usually considered ornamental, should be given cheerfully to doing the necessary work of the world, as a preparation for the advent of real beauty and genuine adornment in all departments of our daily life.

Farmers' Tables.

BY WM. H. MAHER.

Of the thousand and one illusions of my childhood there was none so long-lived, or that I was so sorry to part with, as my ideal farmer. I owe the

poets a grudge to this day for my disappointment. Why should he always have been pictured as "the jolly old farmer," "the most independent man in the world," "living on the fat of the land," and so on? I supposed that being a farmer, and being happy, were synonymous terms. And, as I have struggled with boarding-house beef, half wilted vegetables, strong butter, and watery-milk, I have sighed that my lot was not cast with those blessed sons of the soil—the farmers.

Day after day, poring over journal, cash-book, and ledger, I have drawn pictures of what my life might be when I could lay business aside and be a farmer myself. I was interested in the price of crops, although the only crop I raised was my monthly balance-sheet; and I took an interest in stock, although I was but the owner of a very scrawny-looking dray-horse.

But there came a time when my business could be laid aside, and I at once started out among the people I had envied so many years. Of course you all know how soon the charm was dispelled. The farmer might be independent, but he was very slovenly; he might be exceedingly "jolly," but his wife was dying of overwork; the only part of my early impressions that I found to be true, was that one which told of his living on the fat of the land. He did; on the fat and on but little else.

I had pictured the pleasantness of being among the soft-eyed cows; the graceful, innocent-looking sheep and lambs; the gobblers and other poultry; and there was even a pleasant note—in the distance and in imagination—to be found in the porcine-grunt. But I found the farmer pounding his cows with his milking-stool, kicking his sheep as they passed through the bars, beating his pigs with the most convenient stake, and throwing rocks at the hens and turkeys, as he cursed them in language as coarse as uncalled for.

But if there was aught of the charm still left in my mind, it was dispelled when I sat down to the family meal. Shades of departed dreams, what an awakening! Where were the juicy roast, the tender steak, the fine potatoes, with feelings too big for their jackets, the crimson beet, the sugary parsnip, the golden butter, and the "Adam's ale?" Even echoes fail to answer the question. They were probably on the table of the city boarding-house; they were not here.

The etiquette of the dining-room—of their dining-room—was an etiquette peculiarly their own. Preparation for dinner consisted of a hasty wash in the tin basin, and an equally hasty brush of the hair. The men in shirt sleeves, the "women-folks" with faces red from the stove, sat down at the table, which, to make less work, was placed in the warm kitchen where the dinner had been cooked. The "hearty hospitality" of which I had so often read, consisted in an order from the head of the house, to help myself, as they didn't stand on ceremony there.

But the bill of fare! Forgive them, Professor Blot, they knew no better! It consisted of fried ham, fried potatoes, and fried turnips; bread without butter, and very strong coffee. These were put away without much ado, and then, what was evidently the crowning pride of the house-wife, an immense pie was attacked, and demolished.

There was but very little conversation during the meal, and each one helped himself, if he could stretch far enough, and reach what he wanted.

Supper should be the daintiest meal of the day, and a farmer's supper more tempting than any other man's; but my friend's table was decidedly prosaic and plain; the ham had been warmed up so that it could swim in fat; the bread, cold potatoes, and pie and cake with tea completed the bill.

After supper the family was too tired to sit up long, and I was shown at a very early hour to the "spare" chamber, where I might repose on an immense feather-bed. If I tossed and tossed about that bed all night, the fault must have been in me. Was it not their best bed? and did they not use things all the plainer on their own, that this one might be as good as their neighbors' best?

An early call to breakfast, found me with a

splendid appetite. I could have appreciated a broiled steak, but I probably was over particular, and it served me right, to have to sit down to "the plain food of the farmer." Again the everlasting frying-pan had been brought into use, and instead of a juicy steak, it was fried hard and white. The potatoes almost floated in the grease they had been fried in, and those who wanted butter on their bread might dip in the gravy, as some of my companions did. There was thick black coffee, and the perpetual pie.

Such was the bill of fare for the three meals, and they were fair samples of our board during the month that followed. What was most noticeable to me was the entire, or almost entire, lack of vegetables on the table at every meal. Of course I did not mention the subject so that they would connect it with their own table, but I was curious to learn why it was they ate no vegetables but potatoes and turnips. The answer was they didn't like vegetables; they would as soon eat a pill as a pea; would rather have chopped leather than string-beans; and thought carrots and parsnips were only fit for cattle! When the subject of cooking came up, I noticed they prided themselves first, last, and always, on their cakes and pies.

Where, O, where were my visions now! Dead, dead beyond hope of resurrection. And now I find that these farmers whom I have mentioned are really typical of their calling. The great State of Massachusetts, through her Board of Health, has been looking a little after the farmers of that State, and publishes the result in the last Annual Report of the Board. Among the many questions of the Board to their correspondents, were questions as to the farmer's diet. The result of the questions prove:—

1. Good bread is scarce.
2. There is too little variety in food.
3. Meat is too apt to be fried.
4. Baked beans and salt pork too generally used.
5. Pastry and cakes are used to an injurious extent.
6. Too little time is allotted for meals.
7. Coffee and tea are too freely used.
8. Water is used to excess.

After quoting from the replies of correspondents, the author of the article in question says: "The suggestions of our correspondents are admirable and worthy of heed. The general opinion is: more fresh and less salt meat; less frying and more boiling, broiling and roasting; a greater variety of vegetables and fruits; less pies and cakes; more well-kneaded bread, raised with yeast; less tea.

"It is a somewhat singular fact that farmers live so little upon their own productions. They send their fresh vegetables, fruits, eggs, and poultry, to market, and live themselves upon salt-pork, pies, and saleratus.

"The poor cooking which prevails among our farmers, as well as all other classes, doubtless results from hurry; frying takes but little time and trouble, saleratus bread can be made in a 'jiffy,' and bread and pastry are heavy and sodden, because kneading requires time. The overwork of farmers' wives is therefore, in great part, responsible for inferiority of farmers' diet."

Alas! and again alas! that my fancies should have been thus rudely killed; and yet—it may be that the dream dies slowly—I can't help thinking that the fault is with the men and women who do not improve their opportunities, and not in the calling itself. I can not help thinking that their life ought to be just what it is not. Perhaps, after all, the poets wrote of *what might be*, hoping their prophecies would become realities. Would that the time was here.

[That the above is a truthful account of the way in which some farmers live no one can deny, but in justice to the many excellent housekeepers who are farmers' wives, and not only read, but contribute to these columns, we must say that the strictures of our correspondent are too general. Still, we let him "say his say," in the hope that it may contribute to a reform, for which, we regret to admit, there is still abundant room.—ED.]

BOYS & GIRLS' COLUMNS.

Water Melon-choly Accident.—

Yes, we repeat it, what a melancholy accident is represented in this engraving! Jack and Gill went up the hill, to get a watermelon, Gill brought her's back, but Jack's alack, his little toes it fell on. It is a proverb that "you can not carry two pumpkins under one arm." We never saw any one try it, hut can imagine it a hard task, and it is nearly as difficult to carry one watermelon in two arms, particularly if, as in the picture, those arms happen to be those of a little boy. Indeed, was there ever a more awkward thing to carry than a watermelon? Nature has furnished it with a handle, or stem, all out of proportion to its size, and if the stem chances to be strong enough to hold it, the weight of the melon makes it cut one's

BRINGING HOME THE WATER-MELONS.

fingers. But we must not find fault with the way melons are made, for they are made just right, and the fault is in our not knowing how to handle them. Besides, do we not recollect the fable in which the man found fault that the strong oak here only little acorns, while the heavy pumpkin had a little weak vine, and don't we recollect how an acorn, coming plump upon his bald pate, convinced him that the arrangement was just right, or, as the last line of the fable reads: "For had this tree but pumpkins borne, where would have been thy head?" Very likely Miss Gill will share her melon with her brother, and the next time they go to the melon-patch, they will take a basket along. A great many water-melons from the Southern States are sold in New York streets long before those grown near the city have ripened. These dealers fix a sort of sling of strong twine, so as to make a handle, by which the buyers can carry the unbandy things. There is a hint for boys.

Aunt Sue's Puzzle-Box.

CHARADE.

My first will designate a branch,
Seldom in civil parlance named,
Which, if composed of fibers staunch,
In troublous times will ne'er be shamed.

My next a village in the West,
And 'tis—but no, I can not feign,
Either that this one is the best,
Or yet the "loveliest of the plain."

Long years ago my whole was formed,
For foreign depredation meant,
But when by Nature's powers stormed,
Soon was it into fragments rent. HENRY.

SQUARE WORD.

1. A distinguished general, who, in a council of war, wrote on a card for each of his under-generals: "Advance in solid column, early in the morning." 2. One of Shakespeare's characters. 3. A boy's name. 4. Homes without hearths. 5. To scorch. LITTLE FOLKS.

CROSS-WORD.

My first is in paper but not in ink,
My next is in flower but not in pink,
My third is in whisper but not in talk,
My fourth is in ride but not in walk,
My fifth is in east but not in south,
My sixth is in ears but not in mouth,
My whole is an article dangerous quite,
And when touched with fire it will take its flight
In a column of smoke that is nearly white.

CAPTAIN FUNNYMAN.

AUNT SUE'S NOTICES TO CORRESPONDENTS.

Mrs. LIZZIE M.—Your riddles are very acceptable. Thanks.

TILLIE S. D.—Don't scold: the "Sphinx" of the Graphic Hearst and Home is not at present under my charge, so I am not "responsible."

Thanks for puzzles, letters, etc., to Chas. A. Sproach, F. Vondersmith, Billy Button, E. L. K., N. R. F., jr., Muggins, and Ellie Van B.

The Little Garden.

Last May, I think it was, I had something to say about sowing seeds in your little gardens. There are many plants, which grow much better by dividing the old ones, and planting the pieces of root. And now is the time to be looking out for these, so that when fall comes, and the leaves die down, you will know where to get these roots. It is a good thing, that those who love flowers, also like to have others enjoy them, and they will rarely refuse a bit of a root to another, especially to a child. But all of you who live in the country can easily get plants for your little gardens without troubling others.

The woods and the meadows have many beautiful flowers quite as handsome and interesting as those from other countries, only we don't think so because they are wild and "so common." That is just the way people think of our choice garden flowers in the countries they come from. Sunlight is "very common," but not the less glorious, and so it is with our wild flowers. If you get our wild Columbine from the rocky hill-sides and plant it in good garden soil, it will grow much finer and bloom longer than you ever saw it when growing wild, and if there are any of the garden Columbines near by it will excel them by its grace and beauty. So with the Bluets, the Anemones, the Violets, and a long list of wildlings; if you take them up with a good bit of earth about their roots, and shade them for a few days, the most of them will grow right on as if nothing had happened, even if taken up while in bloom. I say "the most of them," as there are some plants that don't like to be moved, no matter how carefully you do it, but you will only find out which these are by trying. The flowers just mentioned come in spring, and are small. The large late ones had better be marked with a stick, so that you can find the roots when they have done blooming. Many of the Asters, the Cardinal flower, the wild Lilies, the Butterfly-weed, and a long list of late wild flowers, will make a fine show in the bed. This growing of wild flowers in the garden is very interesting; I know, for I have done it for several years, and am quite as fond of my little natives as I am of the more costly ones that come from far-off countries, and have very grand but not very pretty names. Now I hope you all will see that there is no difficulty in the way of any boy or girl who is old enough who wishes to have a garden. Then how fine it will be if the boys and girls of the same family will only work together in it. As I go about the country there is nothing that I see that interests me more than here and there a little corner where some boy or girl has a few flowers. Bless their little hearts, they will get them so full of the love of the most beautiful of God's works that wicked thoughts will find no room.

THE DOCTOR.

Aunt Sue Goes to the Hippodrome.

I promised in last month's Chats to tell you more about Barnum's Hippodrome. Many of my friends went there, and the question was often asked me, "Aunt Sue, have you been to the Hippodrome yet?" "No, I have not." "Oh, you must, it's splendid!" At the risk of falling in the esteem of many of my friends, I must admit that I always did like to go to the circus, and it was not at all unpleasant to be urged to go. I sent in advance and procured two reserved seats, (those who are curious about my personal appearance, need not form an estimate of my dimensions from the foregoing statement, as I intended to go with a lady friend.) It was a very warm day when we found ourselves at Madison Avenue, going into Barnum's, and Oh! how cool and pleasant it was inside. The animals, glass-blowers, candy counters, soda water, lightning calculator, curiosities, portraits of distinguished individuals, etc., etc., are at the back, and under the steps or seats, that surround the arena walked in. I tried to see everything at once, but having only one pair of eyes, I was not successful, so I concluded to go to work systematically. First stall to the right, two giraffes, looking just as they do in the picture-books, only more so, light fawn color, two of them, one eating out of a rack as high as your ceiling, the other sticking his funny little nose through the bars at me; I wished I had a bit of pie for him; "don't eat pie?" Well then an apple or a banana, or something he did like, he had such large beautiful soft eyes. But I mustn't stop here, making love to this giraffe, or I shall not get my money's worth of sight seeing. Next, a funny little black bear, kangaroos, leopards, tigers, four-horned goat, zebra, llamas, guu, guanaco, rhinoceros; I did not stop long to look at these, for a little further on I saw between ten and twenty ponies, from the size of a dog up to a calf, in a stall, with their dear little heads close to the passers by; such saucy little fellows; of course I had to speak to each one, when they stretched their necks so far over the dash-board (?) to greet me. I do love horses, and these were so get-at-able that one couldn't help petting them. One little chap laid his ears back, so I skipped him. Then the elephants. I have always thought I should like to cultivate the affections of an elephant; they are so sensible, so faithful, I should no more insult an elephant, by offering him a stone instead of a peanut, than I would hurt a baby. One of the largest was leaning too far over the stall, trying to reach friendship's offering, when the keeper, going by, said, "go in, Betsey!" and passed on. Betsey turned her trunk towards him, and investigated the back of his vest, until he had got beyond her reach, in a sort of "who are you! and what do you know about it? I shall do as I've a mind to" manner that was very funny. Old Carlo was walking about, in among their feet. Betsey is very

fond of this celebrated dog, and frets after him if he goes away. Carlo is fifteen years old, and can't live much longer, and the elephants' keepers are dreading the effect upon Betsey, when poor old Carlo dies. The polar bears looked a little over done with the heat in their fur robes, but they were refreshed occasionally with ice water. The two immense sea-lions had a grand tank to

Then came France, next Rome, then Turkey, Italy, Egypt, Russia, (the band playing the national air of each, when they first entered), Ireland, Spain, China, India, (camels and elephants had their place in the procession), America, and last and least "Lilliput," lots of little children dressed as knights and soldiers, on my little pets, the ponies, with any number of infantry. It was a

ungracefully, that it looked for all the world like a great goose on four legs.

The exhibition wound up with "20 minutes of fun, or the Lancashire Races." In one minute they had raised booths around the arena. Crowds came to the Fair, four funny fellows danced on a platform; the band played; bells rang; the hand-organ man was there; boys raced in sacks, (tumbled down and couldn't get up); with wheelbarrows; on donkeys; climbed a greased pole: and had just the jolliest time that ever was. One grand race of all the Lancashire lasses on horseback, closed the performance. I need not say that we enjoyed our visit to the Hippodrome.

Something About Dogs.

Who likes a dog? "I," "and I."—Oh yes, of course, you all do. It seems to be a part of boy nature to like dogs. Yes and girl nature too, for the girls are quite as fond of them as the boys, though perhaps they like rather quieter dogs than the boys do. Notwithstanding there are some unpleasant things about dogs, we suppose they will always be kept as domestic animals, and that as long as there are boys and girls, each will like his or her own pet, and think it the best dog that ever lived. A stupid dog is a very uninteresting thing, but there are many dogs that are very far from stupid. They show so much intelligence, that we do not wonder that boys and girls become fond of them. Many and many are the stories that have been told of the intelligence of dogs, and some of them do things, which almost make us think that they know more than some stupid people. Reading in an English journal, the "Science Gossip," not long ago, we came across the following, which was given as something very wonderful for a dog to do. A clergyman says:

"A gentleman residing in my parish possesses a fine animal, which he is accustomed to send daily to the railway station for his newspapers, the distance being about a quarter of a mile. As soon as the train has arrived, the dog takes the shortest cut across the field to the station, and looks at the station-master in a knowing manner, clearly announcing the object of his errand. The railway official duly delivers the paper to the canine messenger, who forthwith takes it in his mouth, and trots back again to his master's house, with a degree of importance which shows that he is fully alive to the trust committed to his charge."

Now this did not seem to us as anything so very strange, and we have no doubt that many of our boys girls have seen dogs do quite as smart a thing as this. And we thought we would ask if it were not so. If any of you can tell us any good dog stories, that is those which show intelligence in the animals, we would like to have them, and if we think they are good enough, we shall be glad to print them.—Who speaks?

The Little Gleaners.

In this country we know little about gleaners and gleanings. In olden times the scattered ears of grain were considered the right of the poor, who went after the reapers and harvesters, and gathered them up for their own use. A very old custom indeed, for in the Mosaic law it was forbidden to reap the corners of the field, and to gather the gleanings of the harvest, as these were for the poor and the stranger. This Scripture custom was kept up within recent times, and the poor laborers in Europe regarded it as their right that their wives and children should pick up the scattered grain. The privilege was often abused, the gleaners not only taking the fallen grain, but often pulling out that which was in the sheaves, and the custom is now but little observed. Indeed, with the reaping by machinery, there is but little left for the gleaners, and they would not find much to gather upon the modern wheat-field. The little ones in the picture have no doubt heard of gleaners, and may have read in the Bible about Ruth, who "came and gleaned in the field after the reapers," and they are following the old custom just for fun. It may be that they are gleaning for their pet chickens, or for their rabbits, but whatever they are doing it for, they, with their bright faces and pleasant laughter, make the field much pleasanter than it would be without them. It is not well to forget about these customs almost as old as the race, even if we have found out other and quicker ways.

THE LITTLE GLEANERS.—Drawn and Engraved for the American Agriculturist.

swim in; what extraordinary things they are to look at. The Bengal tiger was a magnificent animal. The young men who had the animals in charge, were all kind and polite, ready to answer any question to the best of their ability. I asked the keeper of the tiger, if the animal knew him, if it ever showed any affection; he didn't think it cared for him more than any one else, although it always purred like a cat when he fed it. Can you fancy a tiger purring? We would fain to have looked longer at the funny monkeys, at the pretty birds, at the camels, at the glass-blowers making such graceful pretty things, etc. But it was nearly time for the performances, so we went up the stairs leading to the main building, and were shown to our seats. A very fine band, in gorgeous regimentals, furnished sweet music. The signal was given, the drums were beaten and the grand procession, "The Great Congress of Nations," began its march. First Great Britain was represented; "Queen Victoria," clad in purple and gold, on a splendid car drawn by four horses. Earls, heralds, horse guards, yeomen, dukes, marquises, and princes, mounted, and on foot, with their appropriate flags, in attendance. The band played "Rule Britannia," as the royal cortège passed.

gorgeous procession, filling the entire circle and two rows down the centre. That alone was worth the price of admission. But after that came the athlete who walked through rings, (catching his feet in one ring after another), with his head hanging down! A net was stretched under him to catch him if he fell, but I always look at such exhibitions with my eyes shut. The same with Miss "Victoria," when she rode her velocipede, from one end of the Hippodrome to the other, on the "lofty wire." Then came races on horses, races in chariots, monkey races on ponies, "twenty-one horses at liberty," (no riders); they were led up to the judge's stand, and at a signal they were allowed to start. Oh! how they went, like the wind! "Now the black is ahead! The sorrel has passed him, black shoots ahead, neck and neck with grey, wonder if they look like that, when racing wild over the plains! Black is ahead again! How will they ever stop these creatures? The judge taps his bell, black has won the race; the attendants raise a canvas across the track, and the wild arab steeds dart under the curtain out of sight. The camel race was very comical. I had never seen a camel run before, and the creature stuck out its long neck, and tumbled along so

Life Insurance.

All governments have specially recognized the usefulness of life insurance by making laws for its wise direction, watching over it, encouraging and fostering it, because of the benefits it bestows upon all communities. In fact it is the duty of all public authorities, among whom the press is one of the most powerful, to see to it that the system of life insurance shall be made as nearly perfect as possible, and that so long as it affords to the most helpless members of a community absolute security against those terrors of poverty which succeed the death of their natural protectors, it shall be rigidly upheld in public estimation.

Since their organization seventy-one of the leading life insurance companies of the United States have had 47,253 claims presented to them, covering \$139,376,577.08 of insurance, of which 46,935, equaling \$137,625,376.76 insurance, or over ninety-eight and three-fourths per cent. of all claims made, have been paid on demand without litigation or contest of any kind; that 83 claims, covering \$380,677.17 in amount, have been paid after litigation upon the verdict of a jury or by compromise, and 110 claims, covering \$513,232.15 of insurance, successfully resisted, leaving 190 claims, covering \$857,292 yet unsettled.

The history of these seventy-one companies—and they embrace nearly the whole of the life insurance companies in the country—is the history of life underwriting in the United States, and it proves that over ninety-eight per cent. of every claim made has been promptly paid on demand, and less than two per cent. contested in any way. Among these companies is the United States Life Insurance Company. It is one of the strongest as well as most honorable of our life companies. It has never contested an honest claim, and has made thousands of widows' hearts sing for joy because of its timely benefactions. It is a company whose foundations are as solid and whose record is as clear as its renown is wide.

YOUNG MEN.

BOYS & MIDDLE-AGED MEN

Consumers' Importing Tea Co.,
No. 8 Church Street,
P. O. Box 5,509. New York City.

This is a combination of capitalists to supply the consumers of Teas throughout the United States on the mutual principle.

We have experienced agents in all the best districts of China and Japan to select Teas especially for our trade.

We expect every consumer of Teas to render us all the assistance they can in carrying out our enterprise, as we make a specialty of SUPPLYING CONSUMERS ONLY (and allow no middlemen to make any profit on our importations), which will enable us to supply them with Teas at prices lower than have ever been known, and of those fine qualities that seldom reach the interior, being sold only in the large cities and among the very wealthy.

Hoping the consumer will take an interest in our enterprise, and send at once for a circular with full explanations of how to proceed to obtain our goods, we remain,

Most respectfully yours,

Consumers' Importing Tea Co.,
No. 8 Church Street,
P. O. Box 5,509. New York City.

Entered, according to Act of Congress, in January, 1874, by the Consumers' Importing Tea Co., in the Office of the Librarian of Congress, Washington, D. C.

IMPORTANT TO FARMERS,

PLANTERS, PRINTERS, BREWERS, AND ALL USING STEAM POWERS.

ANDERSON'S PATENT STEAM BOILER AND KIPP'S NEW ENGINE.

Best and Cheapest in the World! HIGHEST AWARD.

Large Silver Medal at American Institute Fair, fall of 1873, for the best Portable Steam Boiler, 2 to 12 Horse Powers. Also, 1st and Highest Premiums at seven State Fairs and Expositions.

THIS IS NOT A FLUE BOILER.—It is a boiler within a boiler, the two connected together, and presenting an immense amount of heating surface to the fire, and also securing the Greatest Strength, Durability, and Effectiveness of any Steam Boiler yet introduced. Over 150 put in on trial, and never lost a sale.

25 to 30 per Cent Saved in Fuel—Five Sizes—2 to 10 Horse Power.—Will raise steam from cold water to 60 pounds pressure in 10 to 12 minutes. The Most Economical Combination Extant. Feeds itself from a Tank, and requires no more attention than an ordinary stove, and is just as safe. The engine is of the simplest possible form; the cylinder, bed, frame, guides, and bearings, being all cast in one piece, can not get out of line. Cheese and Butter Factory Apparatus and Fixtures.

WHITMAN & BURRELL, Manufacturers and Dealers, Little Falls, N. Y.

BLAKE'S PATENT STONE & ORE BREAKER.

Carbonized Enamel

IS AS PURE AS GLASS.

The Bridgeport M'f'g Co., OF BRIDGEPORT, CONN.

(Office, No. 88 Chambers St., New York). Have the exclusive control of this valuable enamel, and are using it to cover all of their celebrated

American Submerged Force Pumps.

They also enamel pipe inside and out, which delivers the water chemically pure. The Enamel is composed of vegetable matter, baked on so hard that a blow does not break it, and it resists acids that eat gold.

Gentlemen: I have examined the sections of Carbonized Enamel Pipe submitted to me by you. It is superior to any pipe I have ever seen for resisting acids and conducting water from springs or for use in connection with pumps, etc. The Enamel adheres with astonishing tenacity, withstanding even heavy blows; and the surface of the metal where the enamel is beaten off seems to be protected against the ordinary action of water.

M. C. WELD,

Late Associate Editor Am. Agriculturist.

MUDGE & WOODS, No. 88 Chambers St., N. Y., are the exclusive selling agents of the Bridgeport M'f'g Co. for the Licenses of States, counties, and towns rights for the American Submerged Suction and Force Pumps.

The best Work Ever Issued for Farmers is

BELL'S Carpentry Made Easy.

It is useful to all who have barns, bridges, and out-houses to build, as it treats on the science and art of Framing on a new and improved system, with specific instructions for building Balloon Frames, Barn Frames, Mill Frames, Warehouses, etc.

Nicholson says of "Carpentry": "With an experience of more than twenty-four years at carpentering, I may say it is the best work of the kind I have ever had the good fortune to meet with."

JOHN J. NICHOLSON.

Another Carpenter says: "It is just the book for a young beginner."

PRICE, \$5.00, Prepaid.

HOWARD CHALLEN, Publisher, Philadelphia, Pa.

Schuckers' Life of

CHIEF-JUSTICE CHASE.

New York, July 10, 1874.

Messrs. D. APPLETON & Co., Publishers.

Gentlemen: We are gratified to learn that the "Life and Public Services of S. M. CHASE, Late Chief Justice of the United States," by Mr. J. W. Schuckers, and lately announced by you, is on the eve of publication. We hope it may find a large sale.

Mr. Schuckers' long and close association with Mr. Chase, in a confidential capacity, having been for many years and at his death his private secretary, peculiarly fits him, in our judgment, for writing a history of Mr. Chase's Life.

We know that this book is approved by all the members of Mr. Chase's family, and those of his friends who have examined advance sheets.

Very truly yours,

HIRAM BARNEY, Late Collector of Port of N. Y.
JOHN J. CISCO, Late Assistant Treasurer U. S.
CHAS. G. FRANKLYN, Agent of Cunard Line.
WILLIAM ORTON, Pres't Western Union Tel.

BELLEVUE HOSPITAL MEDICAL COLLEGE.

CITY OF NEW YORK.

SESSIONS OF 1874-'75.

THE COLLEGIATE YEAR in this Institution embraces a preliminary Autumnal Term, the Regular Winter Session, and a Summer Session.

THE PRELIMINARY AUTUMNAL TERM for 1874-1875 will commence on Wednesday, September 16, 1874, and continue until the opening of the Regular Session. During this term, instruction, consisting of didactic lectures on special subjects and daily clinical lectures, will be given, as heretofore, by the entire Faculty. Students designing to attend the Regular Session are strongly recommended to attend the Preliminary Term, but attendance during the latter is not required. During the Preliminary Term, clinical and didactic lectures will be given in precisely the same number and order as in the Regular Session.

THE REGULAR SESSION will commence on Wednesday, September 30, 1874, and end about the 1st of March, 1875.

For the Annual Circular and Catalogue, giving regulations for graduation, and other information, address the Secretary of the College, Prof. AUSTIN FLINT, Jr., Bellevue Hospital Medical College.

"UP FOR REPAIRS,"

A Beautiful, New Picture for Every Subscriber to the

American Agriculturist

FOR 1874.

An exquisite Oil Painting by the celebrated American Painter, Mr. B. F. Reinhart, executed expressly for the American Agriculturist and entitled

"UP FOR REPAIRS,"

has been most successfully reproduced in Chromo by the well-known firm of Bencke & Scott. It is a picture of a scene in childhood, which many will recognize as what they have themselves witnessed or been actors in, and can not fail to please both old and young.

The Publishers will give this beautiful Chromo

To Every Subscriber

to this paper for the year 1874 received after this date, as detailed below. It is ready for immediate delivery at 245 Broadway, Free of Charge.

If to go by mail, 10 cents must be sent to cover cost of packing and postage. For 25 cents it will be Mounted, Varnished, Packed, and sent Post-paid.

N. B.—The Chromo will be delivered: At the Office, Unmounted, Free. " " Mounted, 15 cents extra. Sent by Mail, Unmounted, 10 cents extra. " " Mounted, 25 cents extra.

We advise all to have them mounted before leaving the office, as in the large quantities we put up we are able to mount them for a quarter of the cost of doing it singly, and better than it can usually be done elsewhere.

The picture is designed for every subscriber upon the terms stated above, which please read carefully; and on these terms all are alike entitled to it, whether their names come singly at \$1.50 each, or in Clubs of Four for \$5, or Clubs of Ten at \$1.20 each, or in Clubs of Twenty or more at \$1 each. Subscribers in Premium Clubs will also thus be entitled to it.

N. B.—A few of the beautiful pictures entitled "MISCHIEF BREWING," which have been given to so large a number of subscribers, are still in stock, and, while any remain, subscribers to the American Agriculturist can have their choice between this and the new Chromo "UP FOR REPAIRS"; but the choice must be named at time of subscribing. ORANGE JUDD COMPANY, 245 BROADWAY, NEW YORK.

Money IN THE GARDEN.

A VEGETABLE MANUAL,

PREPARED WITH A VIEW TO

ECONOMY AND PROFIT,

BY P. T. QUINN,

PRACTICAL HORTICULTURIST.

In this work the author aims to give, in a plain, practical style, instructions on three distinct although closely connected branches of gardening—the kitchen-garden, market-garden, and field culture; the only and sufficient credentials for the fitness of his undertaking being a successful practical experience for a term of years.

CONTENTS.

Chapter I. Money in the Garden.	Chapter VIII. Melons.
" II. Hot-beds.	IX. Onions.
" III. Artichoke.	X. Parsley.
" IV. Beans.	XI. Radishes.
" V. Cabbages.	XII. Salsify.
" VI. Egg-Plants.	XIII. Tomatoes.
" VII. Lettuce.	XIV. Forcing Houses.
Chapter XV. List of Seeds.	

PRICE, POST-PAID - - - - - \$1.50

ORANGE JUDD COMPANY,

245 BROADWAY, NEW YORK.

Beckwith Sewing Machine

ONLY \$20.

We have offered as a Premium, and also for sale, for more than a year past, the Beckwith Sewing Machine, which has been fully described in previous numbers of this paper. We have already given and sold more than one thousand of these machines, and testimonials of satisfaction have come from every quarter.

The Beckwith Sewing Machine Company has from time to time added improvements to their original Machines, which have been sold for \$12. They now manufacture only

THE BECKWITH PORTABLE FAMILY SEWING MACHINE.

PRICE \$20.

Enlarged and Improved. Its Weight is 7 Pounds.

PORTABLE FAMILY MACHINE.

A new and very simple braiding-foot has been made, by which a child can sew on braid without the least trouble, following any desired pattern with ease; also a new arm, spiral spring and lever for raising the presser-foot, all of which are now set in a position that leaves the needle free to be threaded. The joint is much enlarged, and the machine is otherwise greatly strengthened and improved. The use of the braider-foot alone will be valued more than the cost of the machine.

The \$20 Portable Family Machine

Comprises all the excellences of the former machines, with many valuable improvements. Its size and power are increased, and its capacity thus very much enlarged, without impairing its portability. There have been added cam and eccentric movement, a balance-wheel, and also an oscillating needle-clamp, by which the length of stitch can with the greatest ease be changed to the finest shade of variation without touching the needle.

Each of these machines is put in a neat, compact box, with hemmer and guide, oil-can with oil, thread, different-sized needles, etc., with full Printed Directions for using.

To any one sending us \$20, we will send one of the Machines (packed in a neat, portable case, with handle to carry it easily), expressage to be paid by purchaser.

The Machine as a Premium.

We will give one of these \$20 Machines to any one who will collect and forward to us Thirty Subscribers to American Agriculturist for one year at \$1.50 each, or One Hundred at \$1 each, expressage on the Machine to be paid by the recipient of it.

Almost any lady can readily secure the small number of subscribers required to get this Machine as described above; or some friend can thus obtain it for her as a present.

ORANGE JUDD COMPANY,

245 BROADWAY, NEW YORK.

TREES, Etc.

- Address
Establish'd 1840.

ELLWANGER & BARRY,

Mount Hope Nurseries, ROCHESTER, N. Y.

PHILADELPHIA, June 11, 1874.

N. GUILBERT, Gwynedd, Pa.—Enclosed is sample of wool of a yearling ewe, bred from the ewe Cotswold that I ordered from you for Mr. Keller, at Akron, Pa.; the wool of the yearling weighed 16½ lbs., and speaks very well for your stock. He intends having it advertised in the Lancaster newspapers. He sold all his other sheep.

Yours, etc., A. R. FRASER, No. 415 S. Second St. Always on hand and for sale, Cotswold Sheep, Southdowns, Blooded Live Stock, Horses, Cows, Calves, Swine, Geese, Ducks, Turkeys, Fancy Fowls, Peacocks, Dogs, Maltese Cats, Rabbits, Guinea Pigs, White Mice, Deer, Swan, Pigeons, etc. A noble pair of thoroughbred Mastiffs, and an elegant English Greyhound Dog. Wanted—Deer, Swan, and Wild Geese. N. GUILBERT, Evergreen Farm, Gwynedd, Pa.

Stephen Hoyt & Sons, NEW CANAAN, CONN.,

Offer for sale a very large and superior stock of FRUIT AND ORNAMENTAL TREES, consisting largely of Apple and Peach Trees. Also, Cherry, Pear, and Plum Trees.

A splendid lot of Concord, and other Vines, one and two years old. 75,000 La Versailles, Cherry, and White Grape Currants. 200,000 Apple Seedlings, two years old, etc., etc.

DWARF PEARS.

A large stock of two-year old trees, very fine. Also, Standard Pears, Apples, Plums, Cherries, &c., &c. Inspection invited. Correspondence solicited. NICHOLAS & NEWSON, Geneva, N. Y.

Climbing Fern, or Lygodium Palmatum.

Pressed or unpressed, sent in perfect order to any part of the country. Enclose stamp. REED WATSON, East Windsor Hill, Ct.

THE PEOPLE'S Force Pumps.

Awarded medal of American Institute over all competitors last fall. For the house and out of doors. Non-freezing, and adaptable to wells from 6 to 100 feet deep. Highly recommended for city houses on account of their great power. Parties about to supply themselves are invited to call and examine. Circulars sent on application. Plumbers are particularly requested to call. See Ogden Farm Papers, Dec., 1871. See "Notes from the Pines," on page 182, May number, of American Agriculturist, 1874.

Certain parties, with the intent to profit by the well earned reputation of these pumps, the result of faithful manufacture, having imitated them, the public are cautioned to look for the name, "People's Pump," Patented Aug. 31, 1859, cast on the lid, to insure obtaining the genuine article, and to avoid litigation.

W. S. BLUNT, 77 Beekman Street, New York.

The Hutchinson Burner.

(Price, 35 Cents, by Mail.) No chimney needed. Fits the common lamps, and burns kerosene with a clear, steady flame two inches high, or any less light desired. For safety, convenience, and economy, unequalled. Sent by mail for 35 cents; two for 60c., with wicks. Write to HUTCHINSON & CO., Cayuga, N. Y.

WANTED, by an American boy, a situation in one of the Western States, where he can learn to be a practical Farmer. He is 16 years of age, is willing to work, and make himself useful. Any Farmer (in Illinois, Iowa, or Indiana, preferred) wishing such a boy, will please address THOMAS C. PATTERSON, 1,157 Mary Street, Elizabeth, New Jersey.

W. H. BANKS & CO., General Agents, 34 & 36 S. Canal St., Cor. Wash'ton, CHICAGO.

A Man of Honor.

By GEORGE CARY EGGLESTON. Finely Illustrated.

NOTICES BY THE PRESS.

A capital picture of Life in Old Virginia before the war is to be found in Mr. George Cary Eggleston's "A Man of Honor." Virginian hospitality, Virginian cousinship, Virginian housekeeping, are portrayed in accurate and attractive colors. It is a life which the author has himself known and loved, and he writes of it with a warmth that comes from the heart.—N. Y. Evening Post.

Really readable in the most refreshing sense of the term—a story of the most amusing and attractive interest.—St. Louis Times.

It is written in an off-hand manner, and is bright and amusing.—Worcester, (Mass.) Spy.

With Virginian life as a specialty, Mr. Eggleston has drawn a simple, straightforward, truthful, and withal, artistic picture of Southern society. It is sketchy, perhaps too much so, but the sketches are all vigorous and show the hand of a practiced artist. In forming the characters of his book it is evident that Mr. Eggleston has drawn oftener on his memory than on his imagination; that he has lived among the people whom he describes, has heard them talk, and seen them under all the moods of ordinary life.—Boston Daily Advertiser.

CONTENTS.

Chapter 1. Mr. Pagebrook gets up and calls an Ancient Lawgiver.—2. Mr. Pagebrook is Invited to Breakfast.—3. Mr. Pagebrook Eats his Breakfast.—4. Mr. Pagebrook Learns Something about the Customs of the Country.—5. Mr. Pagebrook Makes some Acquaintances.—6. Mr. Pagebrook Makes a Good Impression.—7. Mr. Pagebrook Learns Several Things.—8. Miss Sudie Makes an Apt Quotation.—9. Mr. Pagebrook Meets an Acquaintance.—10. Chiefly Concerning "Foggy."—11. Mr. Pagebrook Rides.—12. Mr. Pagebrook Dines with his Cousin Sarah Ann.—13. Concerning the Rivulets of Blue Blood.—14. Mr. Pagebrook Manages to be in at the Death.—15. Some very Unreasonable Conduct.—16. What Occurred Next Morning.—17. In which Mr. Pagebrook Bids his Friends Good-by.—18. Mr. Pagebrook Goes to Work.—19. A Short Chapter, not very Interesting, perhaps, but of some Importance in the Story, as the Reader will probably Discover after awhile.—20. Cousin Sarah Ann Takes Robert's Part.—21. Miss Barksdale Expresses some Opinions.—22. Mr. Sharp Does his Duty.—23. Mr. Pagebrook Takes a Lesson in the Law.—24. Mr. Pagebrook Cuts Himself Loose from the Past and Plans a Future.—25. In which Miss Sudie Acts very Unreasonably.—26. In which Miss Sudie adopts the Socratic Method.—27. Mr. Pagebrook Accepts an Invitation to Lunch and Another Invitation.—28. Major Pagebrook Asserts Himself.—29. Mr. Barksdale the Younger goes upon a Journey.—30. The Younger Mr. Barksdale Asks to be Put upon his Oath.—31. Mr. William Barksdale Explains.—32. Which is also the Last.

ILLUSTRATIONS.—By M. WOLF.

"Now I've Got You" (Frontispiece).—Mr. Robert Pagebrook was "Blue."—"I Fall at Once into a Chronic State of Washing up Things."—"Foggy."—Cousin Sarah Ann.—The Rivulets of Blue Blood.—Miss Sudie Declares Herself "so Glad."—"Let Him Serve it at Once, Then."—"Very Well, Then."—"I'm as Proud and as Glad as a Boy with Red Morocco Tops to his Boots."

PRICE, POST-PAID\$1.25

ORANGE JUDD COMPANY, 245 BROADWAY NEW YORK.

AT CRETE, NEB., LOOKING UP THE BIG BLUE VALLEY.

IF YOU WANT A FARM OR HOME,
 YOU SHOULD BUY OF THE
BURLINGTON AND MISSOURI RIVER RAILROAD CO.
 IN IOWA OR NEBRASKA.

BECAUSE—Their prices are low, ranging for the best land from Three to Ten Dollars per acre.
BECAUSE—No payments are required of the purchaser for four years, except interest at six per cent.
BECAUSE—After the fourth year only one seventh of the principal is payable annually till the whole is paid.
BECAUSE—You are not required to go into a wilderness, these being well-settled States, the population of which is rapidly increasing.
BECAUSE—The mildness of the climate and fertility of the soil is such that the settler can pay for his farm from the products raised upon it long before the time when the principal becomes due.
BECAUSE—Failure of crops from drouth is unknown.
BECAUSE—Large allowances are made upon fare and freight, thus giving low rates on both to purchasers of this Company's lands.

AND YOU SHOULD BUY THIS YEAR.

BECAUSE—Purchasers of our lands in Nebraska during 1874 who cultivate one-half their land within two years from their purchase are allowed a reduction of twenty per cent on its price. **LARGE DISCOUNTS** also, FOR CASH, within One, Two, or Five Years.

**HAKES' IMPROVED
SWIVEL PLOWS,
For Level Land and Side Hill,**

Overcome all objections in Swivel Plows heretofore made for plowing level land, and the same results are obtained as with hand-side plows.

Possess a combination of advantages which recommend them to universal use, effecting the complete inversion and pulverization of the soil on level as well as uneven surfaces, avoiding dead furrows and side ridges, giving an even surface to the fields.

The merits of these Plows are fully stated in our illustrated and descriptive circular, which will be sent by mail, free, to any address. Made only by

AMES PLOW COMPANY,
53 Beekman St., New York,
and Quincy Hall, Boston, Mass.

53 Beekman-st., New York.

THE ONLY RECOGNIZED STANDARDS in CANE MACHINERY are the

Cook Evaporator and
the **Victor Cane Mill.**

18,000 COOK EVAPORATORS are in use, and 13,000 VICTOR CANE MILLS, all warranted. They have taken the FIRST PREMIUM AT 117 STATE FAIRS. All attempts, thus far, to equal these unrivaled machines by other contrivances, have signally failed on trial. Planters can't afford to risk crops of Cane on light, weak, unfinished Mills that break or choke, or on common pans or kettles that do second-class work, and only half enough at that. The *Savory Hand-Book and Price-List Sent Free.* BLYMYER MANUFACTURING CO., 661 to 694 West Eighth St., Cincinnati, O., Manufacturers of Cane Machinery, Steam-Engines, Shaker Thresher, Wood-Sawing Machines, Corn and Cob Crushers, Farm, School, and Church Bells.

I have invented the cheapest and best hay, straw, and stalk cutters in America. Do not pay until you have tried it on your farm and like it. Local Agents wanted. Splendid chance for farmers. Circulars free.
WARREN GALE,
Chicopee Falls, Mass.

**CADY'S PATENT
IRON SLEIGH KNEES**

Have been tested thoroughly the past five years, and are in use in almost every Northern State; we have yet to hear of the first instance wherein they have failed to give entire satisfaction. The increasing demand wherever they have been introduced, has demonstrated beyond question that they are no longer an experiment, but must and are superseding Wooden Knees for the following reasons:

ARE CHEAPER, MORE DURABLE,
NO JOINTS TO DECAY.

WILL CARRY DOUBLE THE
LOAD OF A WOODEN KNEE.

The Wooden runners and beam relieve the Iron Knee from all concussion or strain that would be liable to break it. The braces underneath are dispensed with, which lessens the draft in Heavy Snows and Crusts. They can be constructed with less mechanical skill, and at one-third less expense than by the old method. In fact, these Knees place Bob Sleds within the reach of all.

See illustration and description in *American Agriculturist* January, 1874, page 16.

IMPORTANT TO INVENTORS.
**American Agriculturist
PATENT DEPARTMENT**

In compliance with the request of numerous inventors, we have organized a

PATENT DEPARTMENT

in connection with this office for the transaction of all business connected with

Securing Patents

in the United States and foreign countries.

Reliability

which has been maintained by the AMERICAN AGRICULTURIST for more than thirty years will be carefully guarded in this as in other departments.

All Inventors

desirous of procuring patents at moderate cost are invited to forward (express prepaid) a model of their invention, with a brief description of its working. The model should not exceed one cubic foot in dimension. Upon receipt of model an opinion as to patentability will be given free of charge.

Preliminary Examination

at the Patent Office, to determine patentability, will be promptly made for a fee of \$5.

Litigation of Patents.

The services of the best counsel have been secured to prosecute or protect before the U. S. Courts and the Patent Office the claims of those intrusting their business to this agency. Specifications, drawings, engravings, models, and all other appliances furnished at moderate prices.

In all dealings with this Department inventors may depend upon promptness, fidelity to their interests, and the best services which can be rendered by thorough experts. For full particulars, address

Waltham Watches.

HOWARD & CO., No. 222 Fifth Avenue, New York,
continue to send single Waltham Watches by Express or
Mail to any part of the Country, no matter how remote,
without any risk to the purchaser. Having sold Waltham
Watches on this plan for the last six years, their customers
are numbered by thousands, and from almost every county
in the Union. In every case the purchaser gets a good, re-
liable Watch, and full value for the money. Great improve-
ments have been made during the present year; all grades
and sizes are now made both as key-winders and stem-
winders. Our new price-list which is sent free, describes all
the new Watches with prices of each. Write for it, and
mention that advertisement was seen in the American
Agriculturist. Address,
HOWARD & CO., 222 Fifth Avenue, New York.

THE HOOSIER SCHOOL-MASTER.

By **EDWARD EGGLESTON.**
Finely Illustrated, with 12 Full-Page
Engravings, and Numerous Other
Cuts.

NOTICES BY THE PRESS.

It is full of quaint humor, a tender pathos, and vivid de-
scriptions.—*New York Standard.*
The "events" are stirring and dramatic, and the style is
quiet, impersonal, and almost epigrammatic in its ability to
lay bare an entire situation or character in a sentence or
phrase.—*Brooklyn Daily Eagle.*
It is at once quaint and truthful, and illustrated as it is by
masterly cuts, it should be one of the most popular
books.—*Christian Standard (Cincinnati).*
For realistic conception and life-like delineation of char-
acter, it is not excelled by any American story.—*Methodist.*
Some passages in it, for life-like delineation and the sim-
ple, artless beauty which constitute the highest perfection
of story-writing, are equal to some of the very best passages
in Dickens.—*Belmonte Telescope.*
PRICE, POST-PAID, \$1.25.

The End of the World. A LOVE STORY.

By **EDWARD EGGLESTON,**
Author of "The Hoosier School-Master."

WITH

Thirty-two Fine Illustrations.

NOTICES BY THE PRESS.

The personages who figure in this story are, with one
exception, country people—such men and women as
Wordsworth loved to study. It is not every man, what-
ever may be his talents, that can safely enter this sphere
of literary labor. To be successful in it, he must possess
exceptional qualities; but for those who know how to
find it, here there is gold of the purest, richest kind. In
such a work, however, there is no convenient place
where mediocrity can rest; there is nothing but absolute
failure or absolute success. And Mr. Eggleston has suc-
ceeded. His power lies in the delineation of character.
The plot is ingenious and natural, the incidents are man-
aged with great skill, and there are many descriptive
passages of singular force and beauty. But the strongest
impression left on the reader's mind as he closes the
volume is that he has been in the company of very inter-
esting men and women, and has made a number of new
and valuable acquaintances.—*The Albion, New York.*
Price, Post-paid, \$1.50.

Agricultural Chemical Analysis.

After E. Wolf, Fresenius, Krocker, and Others.

Edited by **G. C. CALDWELL,**
OF CORNELL UNIVERSITY.

PRICE, POST-PAID, \$2.00.

In this work Professor Caldwell has brought together the
processes of analysis which apply especially to soils, fertil-
izers, animals and plants, and their products. He has tested
the methods of the best foreign authorities, and presented
them in a compact hand-book. Such a work has long been
needed by all who teach agricultural chemistry, and by
analytical chemists generally. Professor Caldwell modestly
calls himself the editor, but his book shows that he has not
contented himself with editing the works of others, but has
given much of his own experience.

Either of the above books sent post-paid on receipt of
price, by

ORANGE JUDD COMPANY,
245 BROADWAY, NEW YORK.

JOHN ANDROSS.

BY
REBECCA HARDING DAVIS,
Author of "Life in the Iron Mills," "Dallas Gal-
braith," etc., etc.

ILLUSTRATED.

NOTICES BY THE PRESS.

The story is of intense interest, and holds the reader from
its commencement to its close, and gives much food for
thought regarding the workings of political rings and gov-
ernment frauds in our large cities.—*Post, Salem, Mass.*
The characters and their work are strongly but no doubt
truthfully drawn. Aside from its literary merit, the book
deserves credit for calling attention to a crying shame of
our time.—*Christian Advocate, Pittsburgh, Pa.*
It will at once enchain the attention of the reader, and
prove vigorously and skillfully written, by this among
the foremost novel writers of America.—*Commonwealth,*
Boston, Mass.
Of a story of Mrs. Davis it is hardly necessary to say that
it holds the reader's absorbed attention from beginning to
end. Though the interest of the plot is very considerable,
it is subordinate to the higher interest of the description
and development of character. There is a great deal of
very life-like painting of people and manners.—*Christian
Union, New York.*
The characters are well drawn, the incidents are full of
interest, and the plot sustained with consistency and power.
—*Daily Spy, Worcester, Mass.*
We are constantly struck with the out-cropping of the
one golden thread that holds all her writings together, and
never fails to shine through the web of whatever plot she
weaves about it—that singleness of point and moral more
characteristic of her writings than of any other we know of,
and which is, broadly stated, a self-sacrificing devotion to
duty.—*Daily Standard, Bridgeport, Ct.*
Her hero is a man entangled by the great Ring of Penn-
sylvania, who is sent by this corporation to the State Senate
with a hold of criminality to keep him in hand, who even
then attempts to break loose and join the party of honesty,
but is at the crisis brought in check again by the Ring, with
the still more potent motive of love. . . . The plot is very
well wrought, and the denouement is powerfully couched
and managed.—*New York Evening Mail.*
Price, Post-paid, \$1.50.

PRETTY MRS. GASTON, AND OTHER STORIES.

BY
J. ESTEN COOKE,
Author of "The Virginia Comedians," "Dr. Van Dyke,"
"Surry of Eagle's Nest," etc.

NOTICES BY THE PRESS.

The narrative is ever animated, and here and there touch-
ed with warm, tender, yet natural emotion.—*College
Courant, New Haven, Conn.*
The principal figure of the story, the pretty widow Mrs.
Gaston, is well drawn and attractive, and the author has
displayed in the treatment of this character much care and
ingenuity.—*Boston Traveller.*
The style of Mr. Cooke's writings is smooth and fascinat-
ing, and whoever commences the perusal of them will never
regret the undertaking.—*Westfield News Letter.*
A romance with a most delightful complication of matri-
monial purposes, as well as having a villain, forger, gambler
and detective to assist in the action.—*Boston Post.*
The plot of the principal story is finely wrought out, full
of incident, and there is a sort of fascination about the style,
which claims the attention of the reader until the close.—
Salem Gazette.
A very lively and amusing book.—*Country Gentleman.*
The story is written in popular style—a little plot, a little
mystery, a little love—and is sure to attract a large number
of readers.—*Reading (Pa.) Eagle.*

Newly Revised and Enlarged Edition.

Practical Floriculture.

A Guide to the Successful Propagation and Cultivation of Florists' Plants.

By **PETER HENDERSON,**
Author of "Gardening for Profit."

Beautifully Illustrated. Price, Post-paid, \$1.50.

In this work, which has everywhere become so deservedly popular, not only is the whole "art and mystery" of propagation explained, but the reader is taught how to plant and grow the plants after they have been propagated. The work is not one for florists and gardeners only, but the amateur's wants are constantly kept in mind, and we have a very complete treatise on the cultivation of flowers under glass, or in the open air, suited to those who grow flowers for pleasure as well as those who make them a matter of trade. The work is characterized by the same radical common sense that marked the author's "Gardening for Profit," and it holds a high place in the estimation of lovers of floriculture. The new edition has been thoroughly revised by the author, and much enlarged by the addition of valuable matter

The following are a few of the subjects embraced in the latest edition:

Laying out Flower Garden and Lawn; Designs for Grounds and for Greenhouses; Soils for Potting; Cold Frames; Hot-Beds; Greenhouses Attached to Dwellings; Modes of Heating; Propagation of Plants by Seeds and by Cuttings; Culture of the Rose and Tuberosé; Growing of Winter-flowering Plants; Construction of Bouquets, Baskets, etc.; Parlor and Window-Gardening; Wardian-Cases and Ferneries; Insects; What Flowers Grow in the Shade; Culture of Grape-Vines under Glass; The Profits of Floriculture; How to Become a Florist, etc., etc.

Window Gardening.

By **HENRY T. WILLIAMS,**

EDITOR OF THE HORTICULTURIST, AND HORTICULTURAL EDITOR OF THE NEW YORK INDEPENDENT.

FINELY ILLUSTRATED.

There can be no more attractive ornaments about the house than beautiful flowers, and Mr. Williams's book tells exactly how they may be arranged, and what flowers to plant. It is seldom that a book is published on such subjects containing so much practical information.

—The World (New York).

The Government of Ontario, Canada, having lately established a School of Agriculture, and an Experimental Farm, will receive applications from persons competent to be in charge of the Institution as Principal. The Principal must be thoroughly versed in the practice and science of Agriculture, and possess large personal experience in managing rural affairs. His special charge will be the field department, which he is personally to direct. He is also to devote a daily average of two hours during the year in the class room, to the oral instruction of the pupils in the principles of husbandry, and in such branches of agricultural science, and to such an extent of these branches, as may enable them to understand the scientific facts and principles on which the several field operations are based. It will also be his duty to exercise surveillance over all the operations and transactions of the Institution. Salary, \$2,000, with apartments, fuel and light. Applications, with testimonials, to be addressed to the undersigned, before the 17th October, from whom further particulars may be obtained.

Gardening for Profit.

A Guide to the Successful Cultivation of the Market and Family Garden.

By **PETER HENDERSON.**

Finely Illustrated. Price, Post-paid, \$1.50.

The following voluntary notice of this book comes from a Western market gardener and shipper of vegetables, and is a specimen of similar testimony from very many quarters. "March 23d, 1874.

"If this should go to Mr. Henderson, I would say that I believe the gardeners of this country would gladly hail another edition of 'Gardening for Profit;' at least, I thank him for that little work. Through its influence I left a paying manufacturing business and began to follow its teachings. This was three years ago. Now I have a market garden of thirty acres and 400 four-foot sash, and enjoy myself as I never did before. Again I thank him."

Money in the Garden.

A VEGETABLE MANUAL,

PREPARED WITH A VIEW TO

ECONOMY AND PROFIT,

By **P. T. QUINN,**

PRACTICAL HORTICULTURIST

In this work the author aims to give, in a plain, practical style, instructions on three distinct although closely connected branches of gardening—the kitchen-garden, market-garden, and field culture; the only and sufficient credentials for the fitness of his undertaking being a successful practical experience for a term of years.

CONTENTS.

- Chapter I. Money in the Garden.

Play and Profit

IN MY GARDEN.

By **E. P. ROE,**

Author of "Barriers Burned Away," etc.

NOTICES BY THE PRESS.

The author takes us to his garden on the rocky hill-sides in the vicinity of West Point and shows us how out of it, after four years' experience, he evoked a profit of \$1,000, and this while carrying on pastoral and literary labors. . . . It is very rare that so much literary taste and skill are mated to so much agricultural experience and practical good sense.—*Harper's Magazine.*

This book is as poetical as it is practical. Still he is no dreamer. He goes into every essential detail with as much minuteness and precision as if he were writing a manual for the practical farmer. Indeed few works professedly devoted to agriculture give more sound and valuable information on the secret of winning golden harvests from the soil than this brief idyllic sketch.—*N. Y. Tribune.*

A very charming book, not only by reason of its pleasant style, but for its quiet refined humor and fund of really useful information on the subject of gardening.—*Boston Gazette.*

It deserves to stand side by side with "My Summer in a Garden."—*Christian Register.*

A fresh, lively work.—*N. Y. Observer.*

One reads without weariness and learns much of practical value.—*Chicago Evening Journal.*

Full of information. Explains just what the reader wishes to know. We most heartily commend it.—*Providence Evening Press.*

A chatty, sensible, profitable book.—*Cleveland Herald.*

The book gives much valuable information, and gives it in the pleasantest manner imaginable.—*Detroit Daily Union.*

HUSKING CORN BY MACHINERY. — Drawn and Engraved for the American Agriculturist

When we try to realize the enormous bulk of our corn crop, the figures commonly used fail to give us any clear idea of it. In round numbers, a large crop will now reach a thousand million of bushels. This quantity of corn in the ear, would fill a crib of ordinary height and width long enough to reach from New York to San Francisco. Shelled, all this corn would make up 3,000,000 car loads, which would make a train of box-freight cars 17,000 miles in length, or which would extend nearly three-quarters of the distance round the earth at the equator. The idea that all this vast quantity of corn has to be handled ear by ear in the single process of husking alone, presents to our minds a waste of human labor that is surpris-

ing; to say the least, and opens up a field for the exercise of mechanical ingenuity large enough to occupy scores of inventive minds. The general average saving of labor by the use of machinery upon the farm is in a ratio of 10 to 1. That is, with the assistance of machinery, the labor of ten men is done by one man. The mower or reaper, driven by one man, does the work of ten mowers. The thrashing machine, worked by four to eight men, saves labor in about the same proportion. And in almost all the work of the farm we have the help of machinery, except in the harvesting of corn. The greatest need of the time is a corn harvester. A corn-husker we have, but unfortunately it is far too little known and used. From

three or four years' knowledge and study of this machine, we believe it to be at least as valuable a help to the farmer, and as great a labor-saver as the mower or reaper, and were corn-huskers in as general use as the reapers, we should consider them equally indispensable. The usual amount of corn that can be husked by a fair farm hand in a day is from 30 to 40 bushels. We have found few men to husk more than this, although we have heard of those who profess to be able to husk 100 bushels a day. If we take this extreme quantity as the limit of a man's work, then the husking machine that will husk 100 bushels in an hour, will do as much more than hand labor as may reasonably be expected of any farm machinery.

AMERICAN AGRICULTURIST.

NEW YORK, OCTOBER, 1874.

If there is one admonition that is more timely than another just now, it is to push the fall work ahead. Some kinds of work must be done whatever the weather may be.

Hints about Work.

Winter Wheat.—This crop should be in the ground by this time in the Northern States. In the Middle and Southern States, it may be sown this month.

Corn Husking should be done without delay. Twice as much work may be done on a fine October day, as on a cold blustering day a month later.

should be done by the bushel, and care taken to see that clean work is done, and that the stalks are well bound and shoeked.

Potatoes.—In digging potatoes let them be exposed as little to the sun and air as possible. Dig as soon as tops are dying or dead.

Live Stock generally should now receive more than usual care. Separate unthrifty animals from the rest, and nurse them up before the cold weather comes on.

Weeds.—There is no month in the year while weeds are growing, in which they may not be fought with advantage. Burn everything in the shape of a weed that can be gathered at this season.

Keeping Accounts.—If no accounts have been kept upon the farm, it is a good time now to begin. Make a map of the farm, no matter how rough it may be.

Sundry Matters.—A list should be made of all work that must be done, and that which may be done. Fix a time for doing that which must be done, and stick to it.

Work in the Horticultural Departments.

By the middle of this month, nearly all the harvesting will be finished in the Northern States. There will, however, be plenty of work after harvesting.

Rye or Wheat.—"J. N. J." Middletown, Ohio. Upon an inferior soil, rye would be a better crop to sow than wheat.

as they did during the long warm days of August and September.

Orchard and Nursery.

Fruit.—All late sorts should be harvested before sharp frosts. Never shake good fruit from the trees, but pick carefully by hand, to avoid bruises and consequent decay.

Packing.—In packing take care not to injure the fruit, and let it be well assorted; the difference in price between properly assorted fruit, and that packed as it comes from the tree, will repay a good deal of care in this respect. When good prices can be had, it is better to sell at once. Keep the temperature of the fruit cellar as low as possible without freezing.

Cider.—Do not mix that made from the summer apples, with that from the late fruit, unless for making vinegar. Cider made from the late fall and winter apples, is best for home use. The more care used in sorting the fruit, and the more gradual the fermentation, the better the quality will be.

Planting.—Where fall planting is done, set the trees at once, so that they will become well established before cold weather. Land for planting trees next spring should be plowed in the fall.

Labels.—Replace old and defaced labels with new, and at the same time see that a plan is made with the name and place of each tree.

Nursery Trees should be looked after, and if they need cutting back or trimming, do it at once.

Budded Trees will need looking after, and the tyings loosened if too tight.

Pomace.—If it is desirable to separate seeds for raising stocks, small quantities may be washed out by means of a sieve, but where much is needed, a stream of water and a kind of cradle are required.

Peach Stones should be buried in boxes and left over winter. If considerable quantities are planted, the best way is to sow thickly on the ground, and cover with earth, they will crack during winter and are to be sifted out in the spring and planted.

Fruit Garden.

Grapes.—Allow them to become thoroughly ripe before gathering, whether for table use or for wine; when ripe the stems to the bunches lose their stiffness, and hang directly down.

Strawberries may be set out early this month from rooted runners. Muleh old beds with leaves, cut straw, or hay.

Blackberries and Raspberries.—If the fruiting canes were not cut last month, do it at once, and tie up the new wood to stakes or trellises. If new plants are set this fall, cut back to within 3 or 4 inches of the ground. Set raspberries 4 to 6 feet apart, and blackberries 6 to 8 feet.

Currants and Gooseberries.—As soon as the leaves have fallen, prune thoroughly; cut out such old wood as is not needed, and make an open bush. The cuttings may be planted in rows 18 inches to 2 feet apart, and the cuttings 6 inches in the rows. Press the soil firmly around the lower ends of the cuttings. In two years these plants will fruit.

Kitchen Garden.

Cabbages.—Prepare cold-frames for wintering the young plants grown from seed the last month. The frames should be a foot high at the back, and 8 inches in the front, and the width of the length of a common sash, viz., 6 feet. Set out the plants 2 to 3 inches apart each way, putting them down to the leaves; cover in freezing weather, but not before, as the object is to keep them dormant.

Cauliflowers.—Treat in the same way as cabbages.

Celery.—Finish earthing up, banking the earth well up to the stalks, nearly to the top of the leaves. In cold localities it may be stored in trenches the latter part of the month.

Lettuce.—Some of the hardy varieties will winter over in the open ground, if covered with leaves or litter. For early spring use the plants should be set in the cold-frame the same as cabbages.

Rhubarb.—Divide now if new beds are wanted, as the plants start so early in the spring, that they can not then be handled so easily. Give a heavy dressing of good stable manure to old or new beds.

Spinach.—Sow for spring crop early this month. Thin out the late fall crop, and on the approach of freezing weather, give a thin covering of marsh hay.

Squashes.—Cut on the approach of frost, and allow them to lay two or three days in the sun, covering with the vines at night. In handling take care not to bruise or break off the stems, as this will often produce decay. Store in a dry place, where there is no danger of frost.

Sweet Potatoes.—After the first frost has wilted the vines, dig and allow to remain in the sun until dry. Those wanted for winter should be packed in barrels with cut straw, or dry leaves, and stored in a place where the temperature is not below 60°.

Root Crops.—Have the root cellars, bins, barrels, etc., ready for storing as soon as the weather makes it necessary to hurry up the work. Pits in the open ground answer for storing large quantities; the pits should be 2 1/2 to 3 feet deep, 3 feet wide, and as long as needed. Between every two feet of roots, a space of six inches of earth should be left, as this will allow the section to be taken out easily without exposing the rest. Fill the sections with roots to the top of the ground, cover with litter, and on the approach of cold weather, cover with earth, giving slant enough to allow the rain to run off. Of course such pits can only be made in dry ground where water will not settle during the winter.

Plowing and Draining may be done now, as ground thus treated in the fall, will be ready to work some days earlier in the spring.

Manure.—Save everything that can be converted into manure, and collect leaves, leaf-mold, and whatever other absorbents can be had easily. Cart to the field when the teams can be spared, and place in piles where needed.

Flower Garden and Lawn.

If any improvements are designed in the grounds around the house, new walks or drives to be laid out, now is a favorable time to make them, and much better than in spring when the rush and hurry of work is on. If the ground does not lie so that there is a natural drainage, lay underdrains.

House Plants.—Remove to the house at once such plants as it is desirable to save for another season. Cut back both root and branch, and keep in the shade for a few days, until well established. Make cuttings of all such as it is desirable to propagate.

Cannas.—Take up before the frost has killed the foliage, otherwise the roots are apt to rot.

Chrysanthemums.—After the plants have formed good buds, pot for fall and winter blooming. Those left out ought to have stakes to support them.

Perennials.—Where they have been left for three or four years in the same bed, they should be taken up, divided, and reset; they produce enough better flowers to pay for this extra trouble.

Bulbs.—All hardy bulbs, such as tulips, hyacinths, jonquils, crocuses, etc., ought to be put into the ground by the middle of the month if possible. Tender bulbs, like gladioluses, tiger-flowers, etc., should be taken up after frost, dried off, and stored in a cool, dry place, where they will not freeze.

Dahlias.—After the frost has killed the foliage, dig the roots on a warm sunny day, taking care not to break them. As soon as dry, label, and store in a dry cellar.

Protection.—Collect all materials needed for covering half-hardy shrubs and plants. Red cedar, or other evergreen boughs, marsh hay, and leaves, are all useful. Do not cover too early, as the plants may start if protected too soon. Not only are tender plants, but hardy sorts, benefitted by covering.

Greenhouse and Window Plants.

Even though frost has not made its appearance, it is better to have all tender plants under cover, than to expose them to the cool nights. Plants set

out during the summer in pots or tubs, should be taken in, and either repotted, or the top soil removed, and replaced by rich compost.

Repairs should all be finished by this time, and everything put in proper order to receive the plants. See that all insects are destroyed within the house, and all the plants taken into the house, first carefully examined and freed from all vermin.

Commercial Matters—Market Prices.

The following condensed, comprehensive tables, carefully prepared specially for the American Agriculturist, from our daily record during the year, show at a glance the transactions for the month ending Sept. 14th, 1874, and for the corresponding month last year:

Table with 3 main sections: 1. TRANSACTIONS AT THE NEW YORK MARKETS (Receipts and Sales for Flour, Wheat, Corn, Rye, Barley, Oats); 2. Comparison with same period at this time last year; 3. Stock of grain in store at New York (Sept. 8, 1874, and previous months).

Table with 4 main sections: 4. Exports from New York, Jan. 1 to Sept. 10 (Flour, Wheat, Corn, Rye, Barley, Oats, Peas); 5. Receipts at head of tide-water at Albany each season to Aug. 31st (Flour, Wheat, Corn, Rye, Barley, Oats).

Gold has been up to 110 1/4 and down to 109 1/2—closing Sept. 12th at 109 1/2 as against 109 1/2 on August 12th. The movement in domestic produce, of nearly all kinds, has been on an extensive scale. The receipts of Flour and Wheat have been liberal; and, in view of the very favorable results of the harvest in most countries, holders have been very urgent in offering supplies for sale at much lower prices, leading an active trade, in good part for export, the low rates on ocean freights favoring shippers. Corn and Oats, on the contrary, have been offered quite moderately, and have been in very good demand toward the close at much stronger rates. The dealings in Corn have been largely on speculative account, and the market here, as well as in the interior, and at Liverpool, has been measurably under speculative control. Hence, the advance has been somewhat arbitrary. The old crop of Oats had been almost exhausted before the new crop began to reach the market, and as the wants of the jobbing trade were quite pressing, sellers of the new crop were enabled to realize better prices. The transactions in grain, especially in Corn and Oats, have been largely in stock for forward delivery. Rye has been in limited request at our quotations. Barley has been quite nominal in price, no business having been reported thus far this season. Barley Malt has been in moderate request, but at easier figures. Provisions have been fairly active, but quoted lower and unsettled, closing more steadily. Wool has been in brisk demand, mainly on manufacturing account, closing strong and buoyant in price. Cotton has been freely dealt in, mostly for forward delivery, but at easier prices. The later crop reports, having been less favorable, tended to strengthen the views of holders. Tobacco has been unusually quiet, and much firmer; the demand having been largely speculative. Hay and Straw have been quoted lower on a moderate business. Seeds have been in moderate request, but closed weaker in price. Hops have been held with more firmness, on, however, a restricted business. We now quote this year's growth in our comparative table of prices. The crop of domestic now saved is said to be the finest in quality since that of '67. Brewers, it is thought, will not be long adding out that the hops are much richer and heavier than usual, and that a much less quantity will be required to produce the same result. As to the extent of the yield, the prevailing opinion is that we have grown about the same quantity as last year. In the interior, some 3,000 bales have been bought by dealers on speculation, at an average price of 40c. per lb.

CURRENT WHOLESALE PRICES.

Table of current wholesale prices for various commodities including gold, flour, wheat, corn, and other agricultural products, with columns for item names and prices.

unless fat. With many poor on hand, the market has drooped, and prices are off. For fat stock the prices are 6@6 1/2 c.; common to prime, 4 1/2 @ 5 1/2 c. Choice lambs sell for 6 @ 7 1/2 c. Swine.—With increased receipts, the quotations for dressed hogs have given way slightly. Corn-fed hogs have touched 9 1/2 c. during the month. As we close, we note quotations for live at \$7.18 @ 7.31 @ 100 lbs.; dressed hogs at 8 1/2 @ 9 c., and slow of sale for grassers, and 9 1/2 @ 9 1/2 c. for corn-fed.

Don't Fail To Read about the New Campaign On Pages 393 to 396.

containing a great variety of items, including many good hints and suggestions which we throw into smaller type and condensed form, for want of space elsewhere.

Remitting Money: — Checks on New York City Banks or Bankers are best for large sums: make payable to the order of Orange Judd Company. Post-Office Money Orders for \$50 or less, are cheap and safe also. When these are not obtainable, register letters, affixing stamps for postage and registry; put in the money and seal the letter in the presence of the postmaster, and take his receipt for it. Money sent in the above three methods is safe against loss.

N.B.—The New Postage Law.—On account of the new postal law, which requires pre-payment of postage by the publishers, after January 1st, 1875, each subscriber, whose subscription runs over into the next year, must remit, in addition to the regular rates, one cent for each month over which his subscription extends in 1875, or ten cents for the whole year 1875. Every subscriber, whether coming singly, or in clubs at club rates, will be particular to send to this office postage as above, that is, at the rate of ten cents for the year, additional to the regular subscription. Subscribers in British America will continue to send postage as heretofore, for pre-payment here.

Subscribe this month, and get November and December Numbers FREE. Read "Better Yet" on p. 396.

Our Western Office.—Our friends in the West are reminded that we have an office at Lakeside Building, Chicago, Ill., in charge of Mr. W. H. Busbey. Subscriptions to American Agriculturist are taken there, and sample copies of the paper and chromo are delivered, and orders received for advertising on the same terms as in New York. All our books are on sale at the Western Office. Please call and examine, buy, subscribe, and advertise.

What the Publishers Say.—Very interesting reading will be found on pages 393 to 396 of this number. We specially ask all our friends and patrons who have learned by experience the value to themselves and to their homes of this Journal, to kindly call the attention of their friends and neighbors, who are not subscribers, to the column on page 396, headed "Now Save Money." We say, "kindly call attention," because we are sure that any who may be led by such a call to subscribe for this Journal, will be ready to return thanks for the kindness many times before the year 1875 is over, in consequence of the benefit and enjoyment they and their families, from the oldest to the youngest member, will receive from the American Agriculturist.

Magnolia or Not?—"R. E. F.," Pa. The leaves sent are apparently those of some kind of magnolia, but it is not safe to determine a plant from leaves only. That they drop in autumn, is no proof that

the tree is not a magnolia, as all species that are hardy at the North do so. None of the evergreen magnolias would be hardy with you.

Manual of Geology, by James D. Dana, 2nd edition, New York: Ivison, Blakeman, Taylor & Co. In noticing a work by Prof. Dana, the reviewer has only to name the author, and all who know about such matters, will at once understand that the work is as well high perfect as it is possible for one of its kind to be. We rejoice that one of Dana's eminence, can find time and inclination to write text books for popular instruction. A large share of the school-books treating of the natural sciences are made to sell, and when one like Dana or Gray steps into the field, it should be a matter of congratulation. We need only to say in reference to the present work, that it has special reference to American geology, and that the abundant illustrations are mostly from American sources. While it is admirable as a text book, it is also of great value as a work of reference to the farmer and general reader, a matter in which its very full and complete index will prove of great help. It only remains to add that the publishers have worthily done their part, and that type, paper, and engravings, all tend to make a handsome volume.

Sending Fruit Samples.—The same thing has happened this year that has given us trouble in previous years. Persons send us samples of fruit, with no mark on the parcel to show where it came from. After some days a letter will come saying that a pear, a bunch of grapes, or other specimen was sent several days ago, and asking us to give our opinion of it. In the mean time a dozen samples will have accumulated, and we are without the slightest clue to whom they belong. This has happened a number of times this season, and those who have received no reply concerning their pear, grapes, or other fruit, will know that it is because we are entirely unable to identify their specimens. The law does not allow any writing to be sent with the fruit, unless full letter postage is paid, and our friends must take some other method to designate their parcels. We are always ready to name specimens as far as we are able, and hope that friends who send us packages by mail, will send a letter concerning the fruit by the same mail, or before, never after, and request the postmaster to mark the post office upon the bundle or box, in such a manner that it can be read. When boxes are sent by express, the charges should be paid. It is not fair to ask us to pay all the way from 50 cts. to \$2 for the privilege of looking at a fruit, whether good or bad. A few years ago we paid over \$2 on a box, which, when opened, contained only a decayed watermelon. Always prepay.

Brick Machine.—"J. P.," and others. We are unable, at present, to give the address of the maker of the best brick machine. We know of one, at least, that is working steadily making brick, but have not yet been able to ascertain the address of the maker. We believe there is no machine made that will make both brick or tile by changing the dies.

A Draining Plow.—"W. L.," Oberlin, Ohio. There are many varieties of draining or mole plows made, and their use is certainly to be recommended as beneficial. They operate by breaking up the subsoil and leaving a number of more or less effective channels, by which the surface water finds an outlet to the lowest portion of the farm. This, as it goes, is a sort of draining, which is to be practised, rather than none. The mole plow known as the blind ditching plow, made by H. Chamberlin & Son, of Olean, N. Y., will do the work required.

Wistaria.—"H.," Somers' Center, N. Y. You do not say when the leaves of your Wistaria turn yellow. If before their time it may be mildew, or the plant may be in a very wet place, and unhealthy.

Hedge for N. J.—"R.," Pittsgrove, N. J. The best general hedge plant for you, is the Honey Locust. Sow seeds in spring, and when plants are a year old set them in the hedge row.

Rotation of Crops.—"A. B.," Westmoreland Co., Pa. Our present rotation of crops is susceptible of improvement. We have now corn, oats, wheat, and clover, almost universally. There are three grain crops successively, and but one green crop. This helps the land to become foul and weedy, and is too exhaustive. A better rotation in some places, would be to substitute barley for the oats, and to sow clover with the barley, following the clover with wheat. The corn would come between the two small grain crops. This would help to clean the land, as the cleaning crop, corn, would not come next to the green crop, clover. Or

New York Live-Stock Markets.

Table of receipts for live stock markets, including columns for week ending, beefs, cows, calves, sheep, and swine, with total figures.

Beef Cattle.—At the outset the market opened with an improvement of 1/2 c. a lb. upon prime to extra cattle, while poor stock dragged heavily. It was apparent that the influx of poor cattle would result in a lower average, and while extra beefs sold at fully 1/2 c. a lb. higher than at the same time last year, the low range of 5 cents for the poorest weakened the market all round, and prices drooped throughout the month. At the close the market was dull, with a losing business to shippers. To get \$3 a head above first cost in Chicago, was thought to be doing well, and many were sold at prices which paid nothing for freight. At the close extra sold for 13 1/2 c., to dress 58 lbs.; good native steers brought 9 @ 13 c. @ lb., to dress 56 to 57 lbs., and poor Texans and natives sold for 7 @ 9 c., to dress 55 lbs.

The prices for the past five weeks were as follows: Table with columns for week ending, range, large sales, and average.

Milk Cows.—The business in fresh cows has been fair throughout the month. Good average cows would fetch \$55 to \$60, and choice cows, with the calf, sell for \$75. Fancy cows, for family use, sell occasionally for \$80 to \$100. Only choice cows are wanted at this season. Calves.—The market for veals has been firm throughout, grass and buttermilk calves have eased off. Quotations are for good veals, 7 @ 10 c. @ lb.; grassers, \$4.75 @ 10.50 per head, and buttermilk calves at 3 1/2 @ 5 c. @ lb. Sheep and Lambs have been hard to sell,

where it is possible, the wheat might be followed with grass, mixed or not with clover, or the corn might be followed with a crop of roots. Any of these would be better than our present rotation.

Our Premium List.—Do not fail to read the Descriptive List of Premiums to canvassers for the *American Agriculturist*, which will be found on pages 393 to 396. Everybody wants something that will be found there. Look it over carefully, select the thing you want from the useful and valuable articles named, and then go to work and secure it by collecting the necessary number of subscribers, which you can do with but little effort, as thousands have done in past seasons.

Cotswold-Merino Sheep.—"L. R. D.," Washington Co., Pa. The cross-bred sheep produced from Merino ewes and a Cotswold ram, are probably the most useful class of farm-sheep that can be kept, both for early lambs, wool, or mutton. They are becoming a favorite class of sheep in Europe, and we notice that at the Vienna Exhibition of last year, they attracted a great deal of attention, and were considered "fine examples of sheep" by the judges. Specimens from a flock of 340 of these, bred in Moravia, are described as having wool $4\frac{1}{2}$ inches long, 10 months after shearing, much finer than the Cotswold wool, very bright, having good curl, and thickly set upon the skin. The flesh was firmer than that of the Cotswolds, and lambs, 12 to 14 months old weighed 139 to 148 pounds per head. The half-bred animals bred well together without deteriorating.

Balloon Hanging Baskets, Pot-Holders, Etc.—Peter Hendersou & Co. send us an entirely new floricultural appliance, which can be better understood from engravings, than from description. Instead of making a hanging "basket," with a wooden bowl and rattan supports, the harness of the bowl, so to speak,

is of narrow steel strips, strong, flexible, and elastic. Some of these are contrived as pot-holders, by which a pot can be suspended in the quickest possible manner. Many plants show much better when seen from below, and this contrivance allows any such specimens to be suspended at the window or elsewhere.

Information as to Cheese Factories.—In an item under this head last month, we inadvertently gave the address of Gardiner B. Weeks, as Utica, N. Y., instead of Syracuse, N. Y. Persons desiring trustworthy information respecting cheese or butter factories, can procure it from Mr. Weeks.

Burlington Co., N. J., is one of the great fruit-producing districts between New York and Philadelphia, and its Annual fair should be in some respects one of the best in the country. We notice that the time of holding the fair at Mt. Holly has been changed from September to October 6 and 7.

Goldsmith Maid.—"Pioneer." Through the kindness of Col. Skinner, of the Turf, Field, and Farm, we are enabled to give you the desired information respecting "Goldsmith Maid." Owner's name, H. N. Smith; age, 17 years; on the course, 9 years; best recorded time, at Rochester, N. Y., August, 1874, 2 min. 14 $\frac{1}{2}$ sec. She did not beat Dexter's time in California last year. Goldsmith Maid has since beaten her own time, as above given, at Mystic Park, Mass., Sept. 3, the mile being made in 2.14.

Gathering Leaves.—"W. C.," Kalamazoo, Mich. We have gathered forest leaves with a steel tooth hay rake, after clearing out all the brush, and cutting off the stumps and snags level with the ground. The rake gathers the leaves up as easily as it does hay into windrows, from which they may be piled into heaps and left until there is leisure time to draw them home. They should be drawn in a hay rack upon which are spread some blankets or barn sheets. The easiest

method of loading them is with barley forks, or large barn baskets made very wide and shallow. Such baskets are made purposely for gathering leaves, for the use of charcoal burners, and are sold in large quantities in Detroit and other lake ports, for shipment to the Northern iron regions. They would be very useful for farmers.

Petroleum.—"G. T. C.," Ancora, N. J. Crude Petroleum is not kerosene. The oil, as it comes from the wells, is what is meant by crude or unrefined petroleum. It is a thick black semi-liquid substance, similar in appearance to the coarsest molasses. This oil has the property of penetrating into the pores of wood rapidly, and hardening and smoothing the surface. When handled, it does not stick to the skin as does linseed oil. For this reason it is preferred for preserving shovel handles, rakes, and all the implements about a farm.

Situation of a Dairy Farm.—"J. A. O.," Grantville, Mass. The richest grass lands are the most suitable for a dairy farm. As these are generally found in what are called bottoms, or level alluvial tracts, such a location should be chosen in preference to less fertile uplands. But where rolling lands productive of excellent grass can be secured, we would prefer such to a river bottom for healthfulness of the stock. A limestone soil is preferable to any other.

College of Veterinary Surgeons.—The session of the College of Veterinary Surgeons of New York, commences on Thursday, the first of October. Information as to fees, etc., can be had from Dr. A. F. Liantard, Secretary, 205 Lexington Ave., New York.

The Home Cook Book is the title of a work made up from the contributions of the ladies of Chicago and other places, published by J. Fred Wagener, and sold for the benefit of "The Home for the Friendless." We have often stated that no one can give a proper opinion of a cook-book, until after thoroughly testing it. A book made up in the manner in which this is, will present a greater variety, than if it were the work of one person, and for the same reason we should expect to find various discrepancies in it, as the views of one contributor differ from those of another as to the method of doing the same thing. We can only say of the present work, that it impresses us favorably, and the lady who presides over our household affairs is of the same opinion. It has the merit of freshness and originality, and we have no doubt will prove itself a favorite household guide. Its mechanical appearance is excellent, and its utility is increased by the binding in of numerous blank leaves, which allows the addition of other recipes under their proper heads. We must, however, ask the editor to leave out in another edition, the medical recipes, some of which, especially for hydrophobia and small pox, are too absurd to be published anywhere.

The Ohio State Fair.—Just as we are closing up these pages, there came to hand copious notes from an associate, who attended the Ohio State Fair, at Columbus. We at this late hour can only record its general success, financially and otherwise. The entries exceeded those of any previous year by over 1000, and thus made a very full and varied exhibition. Live stock, especially cattle and horses, were in large numbers. Cattle from Kentucky and Illinois, as well as from the best herds in Ohio, made a fine show. Sheep, swine, and poultry were much as last year. "Fruit Hall" was well filled, and the fruit of great excellence. The new grounds are regarded as admirable, and the management in general is spoken of in the highest terms.

Death of Doct. J. H. Slack.—This gentleman at the time of his death (Aug. 27) was one of the Fish Commissioners of New Jersey. He was well known by his writings on fish culture, and by his successful fish-breeding establishment at Bloomsburg, N. J. His last public service was to hatch a quantity of the eggs of the California salmon, and distribute the young fry in the waters of the Southern and Middle States. He was a remarkably versatile, and at the same time a very modest man, and his death at the early age of 38 is a public loss.

"English" Sparrows.—"S. F.," Rock Grove, Ill. These sparrows are not exclusive English, as they abound on the continent. They are to be had of the bird dealers in early spring at \$2, more or less, the pair, according to the demand. They have done good service in cities in freeing trees and gardens of insects, but we should hesitate about introducing them into a grain-growing neighborhood. Better protect and encourage the native insect-eating birds. The sparrows do not migrate, hence they must be provided with food in winter when snow is on the ground.

See Pages 393 to 396.

Prize Farms.—It is a part of the regular business of the English Agricultural Associations to offer premiums, frequently of \$500 in amount, for the best cultivated farms. Generally there are three premiums offered for the first, second, and third best of the farms entered for competition. In some parts of Germany, in addition to the award of prizes to the best managed farms, the worst cultivated farms are sought out, and the students of the agricultural schools are given the opportunity of comparing the worst and best managed farms together. This is a most valuable aid in their education. We commend the idea of awarding premiums to the best cultivated farms of certain districts, to the State Agricultural Societies, believing this would result in great good. The prize farms might not be visited by a large number of farmers from a distance, but the agricultural journals would take pains to make known in the widest manner, everything of interest connected with them.

The Grayling.—A correspondent at Adrian, Mich., writes: "I notice your article upon the Grayling in the *Agriculturist* for this month. This fish is found on the west side of this State, (that is the lower peninsula,) from the Manistee river northward to the Straits of Mackinaw, and thence in several of the streams on the northeast coast. My son, who lives near the Boardman river, which flows into Grand Traverse Bay, and in which both trout and grayling are abundant, has this season sent me both kinds of fish. Being a native of western Massachusetts, where in my neighborhood trout were plenty, my prepossessions were strongly in their favor, but after trial we consider the grayling fully equal to the trout for the table. They are decidedly a game fish. I have not learned whether they are found in the streams of our upper peninsula, but it is well known that they abound with trout.

SUNDRY HUMBUGS.—Friends often write us about some swindling operation, and ask us to show it up in our Humbug Columns, if it comes within

"OUR SCOPE."

We have never in this matter stopped to consider what were the limits or extent of our "scope." We regard every attempt to get money without rendering a fair equivalent in return, as belonging to the genus *humbug*, whether the operation is in railroad bonds or postage stamps. We do not give much space to swindles involving large sums of money, as those are only practised among bankers, brokers, and other men, who are usually supposed "to have their eye teeth cut." It is these numerous minor swindles, where the sum concerned is a few dollars at most, that need exposure, for it is this class that find their field of operations among rural communities. When we say that farmers are more apt to be taken in by these swindlers, it is not spoken to their discredit. Persons who are perfectly honest and upright themselves, are slow to suspect others of wrong doing, and the man who has never defrauded another of a cent, can not conceive of the meanness which will stoop to wrong him.... We are tempted by some recent occurrences that came under our notice, to repeat some advice which we perhaps have already given in substance in former years. Almost every one, no matter where he may live, expects at some time in his life to visit New York city. While there are many other fine cities, there is but one New York, and every farmer's boy, every village clerk, and even every young miss, has an undefined notion that some day they shall see the sights of the wonderful city, of which their reading has told them so much. So it happens that thousands of strangers, from near at hand and from the far West and South, come to the metropolis solely for the purpose of sight seeing. At all times of the year there are numerous visitors of this kind in the city, but of all other seasons

OCTOBER BRINGS ITS CROWDS.

This month is the most favorable for seeing the city, the days are fine and cool, wanderers have returned from their vacations, the streets are full, the stores are at their best, and there is no other time at which the city is so attractive as in these golden autumn days. Where there are grapes there will be the foxes, and the rascals who make their living by prowling around, increase in proportion with the visiting strangers. Then swindlers, gamblers, and confidence men of all kinds, who have been plying their games at the watering places, the race courses, and the country fairs, or wherever people gather in crowds, are on hand in full force, to meet the crowd that this month assembles in the city, and a few words of

CAUTION TO STRANGERS IN NEW YORK

may save our visiting friends much annoyance and loss. Some of these swindlers, not content to await the arrival of their victims, go out to meet them, and many a man who has met an agreeable traveling companion on his journey to the city, has learned a lesson in regard to this kind of swindling that he will not soon forget. To those

unnsed to traveling we would say, be careful of showing your money. Only take out enough at stations to pay for tickets, keep sufficient loose change for incidental expenses in a handy pocket, and have the rest securely placed in some inside pocket. Having disposed of your money, don't fuss about it and every now and then feel to ascertain if it is safe, as there is no surer way of directing a pick-pocket than this. It is a safe rule to treat traveling companions with politeness, and nothing more; allow no sudden intimacies; if one persists in taking you into his confidence, the chances are that he has some end to serve. Don't change any large bills for any one, and do not tell any stranger what your business is, or where you are going to "stop." Those who have traveled much, and are good judges of characters, have no need of these cautions, but those who have had little or no experience, should be careful how they make chance acquaintances. Whatever you may do at home, by all means avoid

CARD PLAYING WHILE TRAVELING.

When wearied with a long journey, the temptation with some is very strong, to accept the invitation to make the fourth hand at a game of cards. It is safe always to decline, and often highly dangerous to accept. The "social" game is readily turned into a gambling one. "Only 25 cents a side to make it interesting," this point passed the end is not far. It is well known that certain lines leading from the city, are infested by well dressed "gentlemanly" gamblers, who "travel on the make," and we have seen persons stripped by them of every dollar, the conductor apparently knowing all about the little game. Within the city the traps that await the stranger are numerous. One of the common tricks of the street "bummers," is to run up to a stranger with open hand, pretending to be very glad to meet him, asking when he came to town, how he left the folks, where he is stopping, and all that; if the stranger does not know the chap, he says, "Oh! here comes Charlie," and Charlie is sure to know the stranger twice as well as the first one. It often happens that a good natured person, feeling the loneliness of a large city, thinks he might have known these persons at some time or somewhere. If he hesitates or stops to explain, he is quite likely to be taken possession of by his newly found friends, who will not leave him so long as he has a dollar. This thing happens almost every day directly in front of our office, and our young men, when they see it going on, do not hesitate to step out and inform the stranger of the character of his "friends." Another game is for these chaps to get names from the hotel register, and then call upon the guest with some story of being related, or other appeal to his sympathy. The only safe way for an entire stranger in New York, is to absolutely repel all advances of whatever kind from unknown persons. Let him make up his mind what points he wishes to visit during the day, and learn from the hotel clerk how to reach them. If he wishes information while on the streets, ask it of a policeman, and of no one else. Avoid auctions, "great sacrifices," "dollar," and other cheap stores of all kinds. If he wishes to make purchases, and has no friend to advise with, ask the hotel people for the names of respectable dealers, or consult the advertisements of the daily papers. Much more might be said in the way of advice to strangers in New York, and the same applies to other large cities, but we have touched upon those which our observation shows are most needed. Remember that money is the first requisite in traveling, and that next in importance is "common sense," which, among other things, will lead to the proper care and expenditure of it. So much space has been given to those swindlers to whom the victims come, that we have but little left for those who spread themselves over the country through the agency of the mail, but though our budget for the month is a "sizable" one, it is mainly a repetition of the old stories. We have frequently advised our readers to exercise caution in regard to the

CHEAP SEWING MACHINES

advertised so freely everywhere, except in New York. We have before shown that some of the machines were absolutely worthless, and a late complaint has come that money had been sent and no returns made. While we could not declare these sewing machine chaps swindlers, upon the unsupported assertion of persons not personally known to us, there was evidently abundant reason why we should put our readers on their guard. On the day we go to press, the morning papers announce the arrest of R. J. Mulligan, one of the parties against whom frequent complaints have been made. We are unable to give the result of the matter in the present issue. Probably those agricultural and horticultural journals, which advertised this concern so extensively, will be looking around for their advertising bills. Here is a circular of a grand gift concert, of the

MONTPELIER FEMALE HUMANE ASSOCIATION,

which claims to be a home for old, infirm, and destitute ladies, at Alexandria, Va. We have also letters asking

whether it is a humbug or not. Here is a most worthy purpose, that of providing needy women with a home, and it is endorsed and supported by gentlemen of the highest respectability, several of whom occupy distinguished positions in the State and National Government. Yet, notwithstanding all this, we place the scheme among the humbugs. That the lottery, for it is that and nothing more, will be fairly drawn, and that the funds received will be properly appropriated, we have not the least doubt. Indeed we have never seen a scheme of the kind, that was more thoroughly respectable, and on that account we regard it as one of the very worst. When we set this down among the humbugs, we do not imply that there will be any humbug in carrying out the programme, but our objection reaches back of that—to the character of the scheme itself. If we analyze it, we find that it is proposed to give "cash gifts," the modern name for lottery prizes, to the amount of \$1,000,000; (one million). There are 22,178 "gifts" offered, ranging from \$20 to \$100,000 each. To raise the money there are 100,000 tickets offered at \$20 each, wholes, halves, etc., in proportion. Suppose all the tickets to be sold, and all the prizes to be drawn, a thing by no means likely to happen, the tickets will bring in \$2,000,000. Of this \$1,000,000 must go for prizes, and that will leave \$1,000,000, out of which must come cost of advertising and circulars, discount to agents, pay of officers, and every other expense, and we think it not unfair to estimate, that under the most favorable circumstances can more than half a million finally go to the Association. Here, supposing each purchaser to invest in one whole ticket, one hundred thousand people will have engaged in this kind of gambling, in order that they may put five dollars each into the hands of the charity. The circular does not appeal to the benevolence of the community, but holds out the hope of gain as the motive for investment; governors, senators, and other dignitaries, give their names to a scheme which encourages the hope that by investing a little one may, *by chance*, get much. Now, we have no doubt that these very gentlemen are trying their best to shut up the policy shops in Richmond, Alexandria, and other Virginia cities, where the negroes squander their dimes upon just such a game of chance. Gentlemen, you have made a mistake! With your object we are in full sympathy, but your *scheme* is actually not better than "policy" gambling, and however distasteful it may seem, we must record you as responsible for a dangerous and immoral humbug. We notice that postmasters are solicited to act as agents for this and similar lotteries. Perhaps Postmaster-General Jewell will have a word to say on this.

WALL STREET GAMBLING.

Some parties who have no reputation at the Stock-board, but are known as "curb-stone brokers," send out very "promising" circulars, with a view to tempt persons at a distance to put money into their hands. If our Connecticut correspondent, who sends one of these circulars, knows so little about "put and call," "straddles," and other gambling farrago, that he must send to us to find out about them, his very safest way is to keep out of "the street," both in person or by proxy. Still, if he wishes to "know how it is himself," we can suggest no quicker way of finding out than to send a few hundreds to one of the chaps who issue these very taking circulars.

MEDICAL HUMBUGS

may be reported as rather quiet, the "fall styles" have not, at the early time at which we write, made their appearance. They will no doubt come next month almost as thick as the leaves which then fall—and not half so valuable. Our humbug correspondence brings us some strange confidences, but we have had nothing more touching than a letter from a gentleman in Pennsylvania in relation to the doings of an "oxygenated air" quack. This is a case, in which all feelings of delicacy should be put aside, and our correspondent owes it to the community that he should publish the whole affair over his own name. We have before stated that a proper regard for decency prevents us from publishing some of the worst quacks, who profess to be medical men. There are some things which we can not even mention in our pages, where the whole family must see them, but which ought to be exposed. The richest thing in the way of a circular, when we consider its English, which has a strong Eddie Eastman flavor, and the nastiest in respect to its object, professes to come from Trowland & Co., of London, who also have a branch-office in New York; we are sorry to deprive our readers of much fun, but decency demands. Rhode Island is not a very large State, but we think she can show more quacks to the acre than any other. The newspapers of Providence have a wide reputation for ability, yet their advertising pages are filled with quackery, and in a recent visit to that prosperous city, we noticed that quacks of all kinds had established themselves in respectable quarters: the number of "Chinese Doctors," "Catarrh Curers," "Readers of Mind and Soul," and all that sort of thing, were in most

appalling array. Providence presents an unusually intelligent community, its school system is almost perfect; that ancient seat of learning, Brown University, overlooks the city, and yet quackery flourishes there, as it rarely can elsewhere. We do not understand it.

Crusher for Bone or Plaster.—

"J. A. B.," Utica, N. Y. The Blake stone crusher is well adapted for crushing bones or plaster. This powerful machine reduces the hardest substances to small fragments, and bones and plaster can easily be made fit for the mill stones by it. It is made by the Blake Crusher Co., New Haven, Ct.

Yield from Two Potatoes.—

Charles Schultz, Canajoharie, N. Y. writes us that he planted two Early Rose potatoes on the 5th of May, and dug the produce, which was 4½ pecks, on the 25th of July.

Composting Manure.—

"H. C.," Bradford Co., Pa. Manure may be composted with muck, in proportion of 1 load of manure to 5 or 6 of muck. No lime is needed in the compost, nor is water necessary to keep it moist. This mixture will not heat injuriously. If it is evenly made it will not need turning. The muck alone is of very little use. Compost so made is a good dressing for meadows upon all sorts of soils.

To Improve a Rough Meadow.—

"A Reader," Ramsey Co., Minn. There is no machine that will cut off the tussocks or round bunches of sedge or grass roots, which grow upon wet meadows. They must be cut off level with the surface, with a broad sharp adze-shaped tool, or with a prairie-breaking plow, having a broad sharp share. They should then be gathered and burned. But the removal of these tussocks will be only a temporary expedient, unless the meadow is drained in some manner, as they will gradually grow in again and displace the cultivated grasses. Redtop is the only grass that will thrive upon such a wet meadow.

Value of Wood Ashes.—

"M. F. Van G. B.," Rondout, N. Y. Wood ashes are worth about 75 cents a barrel. There are 20 blocks to the mile in the avenues of New York City.

Garget.—

"M. F. Van G. B.," Rondout, N. Y. When cows have once been attacked with garget or inflammation of the udder, they are very apt to become permanently subject to it, and at every calving or change of health, the trouble will return. Much may be done by watchful care, in the way of prevention. When the udder is hard and swollen, and the milk is clotted and drawn with difficulty, a pound of Epsom salts should be administered to the cow, the udder should be bathed with cold water and greased with lard, and the milk should be drawn frequently.

Dysentery in a Calf.—

"C. A. N.," Morristown, N. J. Dysentery is a difficult disease to cure in a young animal. It is generally due to some irritating cause, which needs to be removed by a cathartic. For a three months' old calf two ounces of Epsom salts might be given, with half an ounce of ground ginger. If the discharges continue to be watery, cold rice water should be mixed with the milk, and a tea-spoonful of laudanum may be given daily. The greatest danger in cases of dysentery, arises from the want of prompt treatment of the previously occurring diarrhea. Diarrhea is readily cured by the above treatment, but when dysentery occurs the animal is generally much weakened, and the difficulty is complicated greatly in consequence.

Value of Merino Rams.—

"J. C. deW.," Albany Co., N. Y. We can not give the name of any particular breeder of sheep, who could supply Merino rams for \$25 each. No doubt by reference to the advertising columns the names of parties will be found, to whom you could write. The fancy prices for Merinos, which were current some years ago, have passed away, and by looking out for chances, fair sheep may be purchased very reasonably. We were offered a small flock of the best Vermont blood not long since, for \$10 per head. This was a somewhat exceptional case, but such cases are always happening.

See Pages 393 to 396.

George Such's Catalogue.—

Last year we published some account of Mr. Such's collection of plants at South Amboy, and we now have his catalogue—a very model of neatness and good taste, which he modestly styles a "Catalogue of some Stove and Greenhouse Plants, including Orchids, Palms, Ferns, etc."—"Some!" We should say so!—Here is this catalogue, over which we have pored and powdered, have read by day, and

dreamed over by night—waking only to find that all these treasures were not ours, but were away among the desert sand-hills of South Amboy—and he merely calls it a catalogue of "some" plants! Mr. George Such, you are dis-tressing in your modesty. If you had said "Catalogue of the finest collection of plants in America, and second to but few in the world," you would have told the truth. Here are plants, a single one of some of them equal in value to the whole stock of some florists, put down in as mat-ter of course way, as if they were ten cent verbenas or petunias. If you can quietly say that the price of such a plant is \$50, and upwards, if you can tantalize us with palms at \$150—\$250—\$350, and so on up to \$500—with others so choice, that we can only have "prices on application," why don't you blow?—Seriously, we give this catalogue of Mr. Such's an especial notice, because of its importance. It marks an era in American horticulture. Here is one who makes a business of selling plants, and he is too shrewd a man to offer that which he does not think can be sold; he has confidence in the increase of the love for fine plants, and foresees that our men of means and refined tastes will be willing to pay for the best, and he has brought together a collection that is simply wonderful, not only in the rarity of the species, but in the perfection of the individual specimens. Whether the investment in these choice plants shall prove profitable, or not, Mr. Such is a public benefactor, in placing them within reach of those who can afford to buy them, and the future of our horticulture will be largely influenced by his quiet exertions. Americans are known abroad as always wanting the best, but here Mr. Such places the best at their own door, and we are much in error, if the increasing taste for fine plants does not ultimately repay him for his enterprise.

Effects of Chemical Fertilizers.—

"A Reader." The common idea that artificial fertilizers help to exhaust land would seem to be supported by recent experiments by Professor Voelker of London. In some analyses of drainage water from soils that had been manured with chemical fertilizers he found that lime was rapidly carried off when ammonia-salts had been applied. He concluded that the ammonia soon became changed into nitric acid, which combined readily with the lime, and the combination being easily soluble, was quickly removed and lost to the soil. The ammonia of guano or other powerful manures would of course act in the same manner. For this reason we can not hope to keep our farms fertilized with guano or chemical manures alone. There must be barnyard manure, clover and lime, and the more of them the more ammoniacal manures are used.

The Boucherie Process of Preserving Wood.—

"C. G. M. B.," Detroit. The process known as above, was patented by Dr. Boucherie in 1833. It consisted originally of displacing the sap of a living or newly felled tree with saline solutions; those used by Boucherie were sulphate of copper, pyrolignite of iron, and chloride of calcium. The vital forces of the tree were utilized, and the saline solution was made to flow through the pores of the wood from a circular saw cut at the base of the tree, to the ends of the branches. Three years afterwards another plan was proposed; to force the solution into the wood by hydrostatic pressure. A water tight cap was fitted to one end of the piece to be operated on, and connected by a tube with an elevated reservoir of the solution, 50 feet above the timber. This process is largely employed in France and Germany, for preserving telegraph poles and railway ties.

Wrought Iron Plow Beams.—

"C. S. W.," Conrad, Minnesota. Plows with wrought iron or steel beams are made in Chicago. They are patented, and known as Kimplen's Malleable Iron Beams. They weigh about 30 pounds, and are stronger than any other kind of beam. We do not know the manufacturer's name, but any large implement dealer can procure them.

Clover in the South.—

"Subscriber," Spring Hill, Tenn. In many parts of the South clover has been successfully sown in the fall. Early in September is the time to sow the seed along with wheat or rye; if the soil is well prepared the clover may be sown alone, and will make a strong growth before winter, which will enable it to stand frost without injury.

Leaf Mold for Wheat.—

"J. B.," Oakland Co., Mich. Leaf mold would be of but little service for wheat unless applied in such large quantities, as materially to change the character of the soil. If applied largely, say 200 loads per acre or more, it would probably have some good effect. It would be better still, if 20 or 30 bushels of lime per acre could be mixed with it.

How to Make a Nest Egg.—

"M. S. A.," Dutchess Co., N. Y. A nest egg that can not be broken by frost or accident, and that can not be mistaken

for a fresh egg, may be made by breaking a small hole in each end of a hen's egg, and blowing out the contents. The shell is then filled with plaster of Paris, mixed with water to the consistency of cream. The plaster soon sets solid, and the egg can not be distinguished by the hen from other eggs, but its weight easily prevents it from being mistaken for a sound one. The plaster is such as is used for hard-finishing, and may be had of any mason or marble worker.

Shorthorn Bulls for Breeders.—

Farmers and writers for agricultural journals, have heretofore bewailed the impossibility of procuring bulls of good blood for breeding purposes, at reasonable prices. Notwithstanding, bulls are every day bought by breeders of stock for market, and are scattered through every State from Maine to Texas, making a great improvement in the quality of market cattle. Recently, at some stock sales in Kentucky, thoroughbred bulls of various ages from 5 months to a year, were sold from \$35 to \$100. It would seem that there is no reason now for a farmer to complain of inability to procure a good bull. If he does not get one, it is because he does not want one.

Professional Hedgers.—

"W. W. M.," Springfield, Iowa. Considering the want of knowledge as to the proper planting and the care of hedges, it is not strange that there should be so many failures. Scarcely one hedge in a hundred is a success, and it is probable that before long farmers will find it the best plan to contract with some one who understands his business, to plant and keep their hedges in order, paying a yearly sum for the purpose or hiring the work done by the day. In England where hedges are common, there are "hedgers," who do nothing but make and keep hedges in order. The well known Joseph Arch is a "hedger." It would be much the cheapest plan, and would be nothing more than a division of labor, which is so common a resort in regard to other matters. In the West the planting of hedges can not be abandoned, on account of the difficulties attaching to it. On the contrary it should be greatly increased.

The Western Farmer and Stock

Grower, by Milton Briggs, Davenport, Iowa; Day, Egbert & Fiddler. The appearance of this volume is pre-possessing, and when we came to read in the preface, that the larger portion of the farm literature was "not applicable to the Western prairie," and that agricultural writers, "such as never scented the new mown hay under a July sun" had been writing all sorts of errors, we felt, well here at last is the real thing. We read on, and on, and found such blunders as are only proper to ascribe to too much "July sun," and wondered what it was all about. After reading through 194 dreary pages, we learn on page 195 that the whole thing is an advertisement of Mr. Briggs's stock farm, which is in Jasper Co., Iowa, and we have no doubt a very good one, but if our readers wish to know any more about it, they can buy the book, in which besides this they will find recorded the views of the author on matters and things in general, including the nebular hypothesis, fungi, electricity, and not least the "mad-stone." If this is the kind of farm literature demanded by the Western prairies, we quite agree with the author, that the "older States" can not furnish it.

How to Build Boats.—

"M. K. F.," Griggsville, Ill. Full directions with illustrations for building light row-boats and skiffs were given in the *Agriculturist* for August, 1871, and October, 1872. Each number can be had for 15 cents.

First Lessons in the Principles of

Cookery, by Lady Barker; London: Macmillan & Co. This might more properly be called a plea for the National School of Cookery, at South Kensington. Its 100 small pages are mainly devoted to showing the need for instruction in cookery; its "first principles" are well enough what there are of them, but we can not see the least use for the book in this country, whatever there may be in England. 50 cts.

Liming Eggs.—

"Montclair." The "lime water," in which eggs are preserved, is properly the "milk of lime," that is, a mixture like a very thin white-wash. The eggs are placed in this, and kept in a tank or barrels in a cool dry place.

Limestone Water for Boilers.—

"J. W. J." When used for the Anderson or any other boiler, water that contains lime should be purified previously by some of the "anti-incrustation" preparations.

See Pages 393 to 396.

Effect of Tomatoes upon Cows.—

"A. K.," Chetopa, Kansas. We can not tell what effect ripe tomatoes would have upon cows. It is a question which may easily be determined by observation.

Catalogues, etc., Received.

While some dealers issue but one catalogue for the year, others put out one in the spring and another for the fall trade. The majority of those enumerated below, are fall lists made as supplementary to the main catalogues. In the early numbers of the *Agriculturist* for the present year, from February to June, will be found notices of the catalogues of a large number of dealers. We repeat here what was said in enumerating the catalogues last spring; we do not notice or allow to advertise, any party or firm that we do not consider as fair dealing men, and the fact that we make mention of their trade lists, is sufficient evidence that we consider them safe to order from; this is mentioned to save our friends the trouble of writing to us for our opinion of this or that dealer. Moreover, we cannot advise our friends at what particular establishment to make their purchases. Unless such inquiries are made in regard to some article not generally kept, we always decline to indicate a preference for one dealer over another.

NURSERIES.

OTTO & ACHELIS, Morris Nurseries, Westchester, Pa. Wholesale list of general stock and young evergreens.

A. HANCE & SON, Rumson Nurseries, Red Bank, N. J. Buds of peach and other trees, and grape vines.

BUSH & SON & MEISSNER, Bushberg, Mo.—Our esteemed friend, Geo. E. Meissner, has united himself with the celebrated house of Isidor Bush & Son, and what they do not have in the way of grape vines, will be difficult to find elsewhere.

BRONSON, HOPKINS & Co., Geneva, N. Y.—A full wholesale list of fruit and ornamental trees.

DOWNER & BROTHER, Fairview, Ky., succeed J. S. Downer & Son, by reason of the death of the senior Mr. Downer—and propose to sustain the well deserved reputation of the Forest Nurseries.

NICHOLAS & HEVSON, Geneva, N. Y., issue a very full wholesale list. This stock is grown upon the land formerly celebrated as the farm where Jas. O. Sheldon raised his Shorthorns.

C. P. LINES, New Haven, Ct., makes grape vines and small fruits his specialties.

THOMAS MEEHAN, Germantown, Pa., has a list remarkably full in the department of ornamental trees, including kinds rarely offered. He offers hedge plants in large quantities.

A. BRYANT, JR., Princeton, Ill., has a catalogue full in all departments, but especially in forest trees.

S. B. PARSONS & SONS, Flushing, N. Y.—A fine list of ornamental trees, etc., with evergreens, rhododendron, camellias and azaleas as specialties.

CALKINS & BROOKS, Bricksburg, Ocean Co., N. J., with a general stock, give special attention to peaches, apples, grapes and strawberries.

L. B. CASE, Richmond, Ind., with the general nursery trade, unite a large florists' establishment.

JONES & PALMER, Rochester, N. Y., offer large quantities of stock at wholesale rates.

J. DE SAINT-ANGE, Rochester, N. Y., is general agent for several French nurseries and seed-growers.

RANDOLPH PETERS, Wilmington, Del., has a very full catalogue; he is one of the largest growers of peach trees in the country, and we have personal knowledge that he sends out well-grown stock.

HOOPES BRO. & THOMAS, Cherry Hill Nurseries, Westchester, Pa., send two catalogues, wholesale and retail, which show that this old establishment is quite up with the times.

ELLWANGER & BARRY, Mount Hope Nurseries, Rochester, N. Y., have such a large and varied stock, that their different catalogues make a handsome volume. Besides general nursery and florists' stock, their fall catalogue announces a full assortment of bulbs.

FLORISTS.

Several of those whose main business is that of nurserymen, also deal in florists' stock.

ROBERT J. HALLIDAY, Baltimore, Md., offer camellias, azaleas, roses, etc., at wholesale as well as at retail.

GEORGE SUCH, South Amboy, N. J.—This remarkable catalogue has a special notice elsewhere.

LONG BROS., Buffalo, N. Y., publish their catalogue of winter-blooming plants in the form of a supplement to their "Home Florist." It contains very full and useful cultural directions, and is well illustrated. The "Home Florist" itself is one of the best things of its kind.

W. J. HESSER, Plattsmouth, Nebraska.—There is no more striking illustration of progress in the Western States than this price list, offering a general assortment of green-house plants, and at wholesale too! Alaska will be doing the same thing next.

SEEDS AND BULBS.

J. M. THORBURN & Co., 15 John-st., New York, are first in the field with their catalogue of bulbs and flowering roots: a very full list.

PETER HENDERSON & Co., 35 Cortlandt-st., New York, have also a full catalogue, in which, besides bulbs, they include grapes and small fruits, and a full list of garden requisites.

B. K. BLISS & Sons, at 34 Barclay-st., New York, have their new store well filled with bulbs and other stock, all of which their catalogue describes.

JAMES FLEMING, 37 Nassau-st., New York, whose place is by the removal of other dealers now an "old stand," also imports fine bulbs.

FRANCIS BRILL, Mattituck, (L. I.), N. Y., not only writes a book on seed-growing, but grows seeds for sale, and offers several choice varieties.

YOUNG & ELLIOTT, at their new store, No. 12 Cortlandt-st., which is the great auction flower-mart of the country, also have all the bulbs of the season.

JAMES VICK, who, it is hardly necessary to say, is in Rochester, N. Y., offers his usual stock of bulbs, which he sends very safely by mail.

HENRY A. DREER, Philadelphia, is also in the field with a general assortment of bulbs, and green-house plants of the season. That this house sends out well-grown plants, we can testify from personal experience.

BROOKS BROTHERS, Rochester, N. Y., make a specialty of bulbs, and also offer a choice assortment of winter-blooming house-plants.

BULBS IN BOSTON.—After this list was closed, the fall announcements of our Boston friends came in. We can not, at the last moment, give each a separate item, and it is sufficient to say that the well-known houses of Hovey & Co., Washburn & Co., W. H. Spooner, and T. D. Curtis & Co., have everything in the way of bulbs and seeds that can be found anywhere.

LIVE STOCK, ETC.

M. QUINBY, St. Johnsville, N. Y., offers bees, and all the requisites of the apiary.

HERBERT MEAD, Waccabuc Farm, Golden's Bridge, N. Y., catalogues Jersey cattle, swine, and dogs.

F. J. KINNEY, Worcester, Mass., believes in Brown Leghorn fowls, and tells about them in his circular.

IMPLEMENTS AND MISCELLANEOUS.

HARTFORD PUMP Co., M. C. Weld, Agent, 189 Water-st., New York. The remarkably ingenious machinery made by this Company, is described on another page.

G. T. PECKHAM, Providence, R. I., makes the fountain pump, and sends illustrated circular.

LORD'S HORTICULTURAL WORKS, Irvington, N. Y., turn out greenhouses and other glass structures, which are illustrated in a neat pamphlet.

EUROPEAN CATALOGUES.

E. G. HENDERSON & SON, London, N. W., Eng., send a catalogue of new plants, including all the novelties in soft-wooded stock.

WILLIAM BULL, King's Road Chelsea, London, S. W., Eng. Mr. Bull styles himself "New Plant Merchant," a name to which he is justly entitled, as the number of novelties he has brought into cultivation is something wonderful. Two monstrous catalogues, one of seeds, and the other of plants, the last named finely illustrated, are evidence of the extent of his collection.

CH. HUBER & Co., Heyeres, France, send a list of choice Primula and other seeds.

VILMORIN, ANDRIEUX & Co., Paris, France, present a list of seeds of all kinds, illustrated by the charming little engravings, that make their "Atlas of Flowers" so valuable. Their agents in this city are Pabst & Esch, 11 Murray-st.

JOSEPH SCHWARTZ, Lyons, France, sends a catalogue of roses, which are so great a specialty with him, that he calls his place "Terre des Roses," or Rose-land.

J. LINDEN, Ghent, Belgium. After the purchase of the renowned collection of A. Verschaffelt, Mr. Linden removed from Brussels to Ghent, where he maintains one of the finest establishments in the world.

J. C. SCHMIDT, Erfurt, Germany, besides a large collection of living plants, does a great business in flowers, grasses, and moss, dried, dyed, and otherwise, prepared for bouquets and other decorations.

L. VAN WAYEREN & Co., Hillegom, Holland, sends his wholesale catalogue of Dutch Bulbs, and informs us that he is represented in New York by Richard Lauer.

Industrial Fairs.

Besides the various State, County, and other Fairs, which are, or should be, mainly agricultural, of late years there have been held in various parts of the country, fairs, or "expositions," as it is now fashionable to call them, in which agriculture, if represented at all, is subordinated to other forms of industry; at these fairs mechanical arts and manufactured products, as well as the fine arts, are the main features. For a long time the American Institute of New York was the only exhibition of this kind, but recently the principal cities of the Union have held similar fairs, and found them not only interesting, but profitable. They are certainly deserving of every encouragement, as they bring together under one roof a view of the leading industries of the cities in which they are held, and also often show in comparison the productions of other localities. As not only products are shown, but frequently the processes by which they are produced are to be seen, these exhibitions are highly instructive, and they should be encouraged as important educational agencies. We are glad to notice that in Rhode Island all the manufacturing establishments in the vicinity suspended work for one day, in order to allow the employes to attend the recent N. E. Fair, and we would suggest to manufacturers in and near the cities where these industrial fairs are held, that the example of the Rhode Islanders is worthy of imitation. Indeed, those establishments which employ skilled, and in a degree permanent laborers, would find it a good investment to provide their workmen and their families with free tickets to these fairs. The return would come in increased intelligence as applied to their business. As the pioneer exhibition of this kind we mention first

THE AMERICAN INSTITUTE,

which opened the doors of its *forty-third* exhibition early in September, and will keep them open until the middle of November. October is the month in which New York is most thronged with strangers, to many of whom the Am. Institute Fair is one of the chief attractions; nor are the city people unmindful of the fair, and its spacious halls, especially in the evening, are filled with admiring crowds. This fair is some years better than at others, but we have never seen one of its exhibitions which did not amply repay attendance, or from which an intelligent person could not gain new and useful ideas. We go to press before we are able to visit the present fair, but learn that it is unusually attractive, especially in machinery and the processes of manufacture. The fair is held in the readily accessible and spacious hall, formerly the "Rink," which extends from the 3d to the 2d Avenue on 63d St.

THE CHICAGO INTER-STATE EXPOSITION

opened on the same day with that of the Am. Institute. Our representative there sends us a full account, but we have only room for the following extracts:

"The building is one-third larger than it was last year, the greater part of the added space being devoted to agricultural implements and machinery, and to floral products. The floral display is an extraordinary one, both as to character and extent. Eastern as well as Western professionals are represented, and amateurs have contributed. In the machine department nearly all leading manufacturers of the country are represented, those of the West assuming scarcely more prominence than others. In farm products the principal display is made by the land grant railroads, interested in calling attention to the productiveness of the sections along their roads. While these displays are very fine, they are chiefly remarkable as showing what a well organized effort can do in bringing prominently before the public the productiveness and peculiar excellence of a particular locality. Outside of this department, the display of farm products is not specially noticeable.

"The fine art department contains the largest collection of fine paintings ever exhibited in this country, contributions coming from New York and other Eastern cities, to be added to the collection from the West. This has the character of a National exhibition.

"Other departments show the business of Chicago in miniature. All that is curious or worthy in manufacturing is represented.

"The Exposition Building is at the foot of Adams St., four blocks east of the Western office of the *American Agriculturist* in the Lakeside Building. Our friends in the West, while visiting the great representative exhibition of the North-west, will have a hearty welcome extended to them at our Chicago office."

THE CINCINNATI INDUSTRIAL,

which was such a marked success last year, is advertised to close on the 3d of this month. From the extended report of last year's show we feel warranted in advising our Western friends, who get this notice in time, to make the most of the last few days.

THE LOUISVILLE (KY.) EXHIBITION

keeps open until Oct. 7th. This fair proved a great success last year, and presented several novel features.

THE FRANKLIN INSTITUTE

celebrates its semi-centennial by an exhibition at Philadelphia, which holds from Oct. 8th to 31st. An unusually favorable location has been secured, and this will probably be the greatest mechanical display ever seen in the country.

THE NEWARK (N. J.) INDUSTRIAL FAIR

is open as we write, but we are not informed how long it will continue. It is an interesting epitome of the wonderfully varied industries of Newark.

Supplementary List of Fairs.

The following list gives the later fairs not in the one published last month. Some changes of date are given here. See list of last month (September) for other fairs to be held in October or later.

MAINE.

Kennebec East.....South China.....Oct. 6-8
Kennebec North.....Waterville.....Oct. 6-8
Knox.....Thomaston.....Oct. 6-8
Jay.....Jay.....Oct. 7-8
Somerset Central.....Skowhegan.....Sept. 29-Oct. 1

VERMONT.

Barton.....Barton.....Sept. 29-Oct. 1
Rutland.....Rutland.....Oct. 6-7

MASSACHUSETTS.

Norfolk Club.....Norfolk.....Oct. 7-8
Stow.....Stow.....Oct. 2

CONNECTICUT.

Hartford.....Bloomfield.....Oct. 1
Milford and Orange.....Orange.....Sept. 30-Oct. 1

NEW YORK.

Catskill.....Catskill.....Oct. 1-2
Columbia.....Hudson.....Sept. 29-Oct. 1
Hudson River.....Poughkeepsie.....Oct. 20-23
Skaneateles.....Skaneateles.....Oct. 7-8
Westchester.....Yorktown.....Sept. 29-Oct. 1
Yates.....Dundee.....Oct. 14-16

NEW JERSEY.

Burlington.....Mount Holly.....Oct. 6-7

PENNSYLVANIA.

Carbon.....Leighton.....Oct. 6-9
Chartiers Valley.....Canonsburg.....Oct. 13-15
Cumberland.....Carlisle.....Oct. 6-9
Greene.....Waynesburgh.....Oct. 14-16
York.....York.....Oct. 6-9

MARYLAND.

Alleghany Valley, W. Va. & Penn. Cumberland. Oct. 20-23

VIRGINIA.

Baldwin-Augusta.....Staunton.....Oct. 13-15

OHIO.

Fairfield.....Lancaster.....Oct. 14-17

WISCONSIN.

Dodge.....Beaver Dam.....Oct. 5-7

IOWA.

Delaware.....Manchester.....Sept. 30-Oct. 1
Jasper.....Prairie City.....Sept. 29-Oct. 2

MINNESOTA.

Martin.....Fairmount.....Oct. 8-9

CALIFORNIA.

Santa Clara Valley.....San Jose.....Oct. 5-11
San Joaquin.....Stockton.....Sept. 29-Oct. 3
Southern.....Los Angeles.....Oct. 25-Nov. 1

PROVINCIAL.

Nova Scotia.....Halifax.....Oct. 5-10

The New England Fair.

The fair of the N. E. Agricultural Society was this year held in conjunction with that of the R. I. Society, at Narragansett Park, near Providence. Those who have visited this race-course, which was built by Col. Amasa Sprague, in the days of the great prosperity of the Spragues, know that it is unequalled in the country; everything about it, even to the smallest accessory, is of the most thorough character. No society ever had a finer place for a show, and in some respects the show was worthy of the place. In cattle the exhibition of this year has not been excelled by that of any former one held by the Society, indeed, the strength of the exhibition, to all but horse people, lay in the cattle, which included bulls, cows, and calves of all the leading breeds, as well as grades, fat cattle, and working oxen, and these came from every New England State, though Rhode Island was most largely represented in proportion. We have not space to enumerate the fine animals, or even the premium herds. The show of different breeds by Mr. George F. Wilson, of Providence, was remarkable for size and excellence, and the rare Swiss cattle of Messrs. Aldrich & Hall, with their picturesque collars and sweet-sounding bells, attracted much attention. The commodious stalls of the park al-

lowed a better inspection of the horses, than one can usually make at a fair. Swine and sheep were not in large numbers, but good animals of their kinds were shown, and while the poultry was not so numerous, as all New England ought to show, there were some excellent coops. In the poultry-tent we observed an instance of great cruelty to animals; right in the midst of the fowls was a coop containing a pair of foxes, the mental distress of these animals thus surrounded, must have equalled that of Tantalus, and is recommended to the attention of Mr. Bergh. The halls attached to the grand stand afforded room for the display of manufactured articles, sewing machines, and the like, while other machinery and agricultural implements were shown in an enormous tent near by. The display in all departments in this tent was very full, and was largely enhanced by the contributions of Messrs. W. E. Barrett & Co., of Providence, one of the heaviest houses in this line in New England. The horticultural portion of the exhibition was held in the city, at Howard Hall, a spacious room, which was well filled, though largely by Rhode Island growers; Hovey & Co., of Boston, had a large show of pears, and Vick, of Rochester, was represented by a good display of annuals. The time was rather too early for the best display of fruit, and the R. I. Horticultural Society, at their exhibition some weeks later, propose to excel this in excellence. The vegetables were remarkably good, though not so numerous as they should have been.

We have not yet heard the pecuniary results of the fair, but if it did not pay expenses, it should have done so, for the arrangements for exhibitors, spectators, and the press, were in all respects admirable, and if we mistake not, credit for these is largely due to the labors of Col. Pitman, Secretary of the R. I. Society. While we record high praise to the fair as a whole, we are obliged to point out some faults. The exhibitions of the N. E. Society have more than any others been of the horse, horsey, and the present was no exception; we believe strongly in the utility of "that noble animal, the horse," but can not see what agricultural bearing there is in the fact, that a certain gray mare went round the track in two seconds less time than a certain brown gelding. There is no getting over the fact that this was an agricultural horse-trot, with other matters as appendages. The N. E. Society is an important one, and its influence in degrading fairs into horse races has not been for good; we have, however, reason to hope for better things, as Col. Needham, the secretary, stated at one of the evening meetings, that he hoped the time was not far distant, when the Society could hold a fair without depending upon horse-racing—or words to that effect. Another glaring fault at this fair was the admission of all sorts of side-shows within the grounds. If armless, under-lean, and over-fat humanities must exhibit their deformities, pray keep the disgusting things outside of the fair-grounds. Quackery of all kinds, that should have been kicked outside of the gate, was rampant within the enclosure. The President of the N. E. Society hears, and we doubt not rightfully, the title of *Doctor*, yet within hearing of his tent there stood a mountebank, all decked with gold-lace and other finery, in his gaudy baronche, with a servant in showy livery, and this arrant quack was allowed to cry out the virtues of his vie compounds without hindrance. Gentlemen, who manage the N. E. Society, we have a right to expect better things of you. We do not like to find fault where there was so much to praise, and we trust that the toleration of these nuisances was an accident that may not again occur.

Our Patent Department.

In so large a circle as the readers of the *Agriculturist*, there will, of course, be many inventors, and probably many times more among our readers than in the same number of persons who do not take the paper. In years past a considerable share of our correspondence has been in relation to inventions, and we have been frequently consulted as to the advisability of patenting this or that invention, and often asked to put the inventor in the way of procuring a patent. In all this correspondence, complaints were not wanting of enormous fees charged by patent-agents—fees, which seemed to us out of all proportion to the service rendered. As the Patent Office is a department of the government, and is presumably for the benefit of the people, we could not see why persons wishing a patent should not deal directly with headquarters and dispense with patent-agents altogether. With our then knowledge of the subject, it seemed that the people should have direct access to, and deal directly with, the officers placed in the Department for the express purpose of attending to the very business, which inventors pay the agents for doing. Having excellent friends in the Patent Office, we consulted with these, as well as the Commissioner himself, as to the propriety of advising inventors to have nothing to do with agents, but to deal directly with the office. The result of these interviews

quite changed our notions. In an ordinary court of law a man may manage his own case, and may possibly succeed; the probabilities, however, are that he will fail, and his failure is likely to be due to a want of knowledge of the law. While those who wish to manage their own cases at the Patent Office, will find the officers ready to offer them every facility, they must take the risk of the mistakes into which they must fall from not knowing the laws. The patent laws are so many, and have been so modified and variously complicated—by the law-makers and not by the officers of the Department—that it is hardly possible for one not versed in patent laws to manage his own case to the best advantage. So, while here and there an inventor may be able to get along without the aid of an attorney or agent, we were quite convinced that it is, as the laws now are, better for the inventors, as a class, to engage competent advice and aid. We are well aware—and we are quite sure that the officers of the Department agree with us—that there is much about the existing laws that is absurd and useless, and that they should be greatly simplified, but as long as the laws exist, they must be complied with, and until the whole code is revised, it becomes a necessity for inventors to seek the advice of those who have given special study to the laws as they now stand. In order to offer inventors intelligent aid in this respect, we some months ago associated with ourselves a gentleman, who has made a speciality of patent matters, and one who stands very high in the esteem of the officers in the Department at Washington, and are thus able to offer the best possible services at reasonable rates. Though we have not announced this department of our business otherwise than through these columns, the number of patents it has secured has been very encouraging, and the letters of those who have obtained patents through its aid, express the greatest satisfaction with the manner in which it is conducted. It is hardly necessary to ask our subscribers to send their patent business to this office, but we do ask them to do us the favor to mention our patent department among their inventing friends, and assure them that their patent business will be attended to promptly, and that they will be dealt with fairly.—Circulars may be had on application.

"Walks and Talks" Correspondence.

AGE OF BREEDING SOWS.—"D. F. C." Scott Co., Iowa, writes that the general custom there is to breed from young sows. They aim to have the sows farrow in April and May; they are then fattened for market the next fall. This plan is very convenient, but it will not do to breed the sows too young. I seldom let my sows breed until they are 15 or 18 months old. Breeding continuously from such young sows only, the breed would degenerate. It would be better to wait 6 months longer. The pigs intended for breeders should be fed liberally until 5 or 6 months old, after that they should have plenty exercise, and less nutritious food. During the following summer and autumn they will need nothing but pasture, and the run of the stubbles after harvest. The sows will be strong and fully matured, and will probably prove good sucklers, and will soon recuperate after the young pigs are weaned, and can easily be fattened early the next fall.

ESSEX OR BERKSHIRE.—"D. F. C." further says: "I have a cross of Berkshire on Poland-China sows. The pigs are fine enough in the bone; but the Berkshires are a little too wild to suit me. Would the Essex be better than the Berkshire in this respect?"—The Essex are distinguished for being remarkably quiet. But much depends on how they have been bred and managed. A well-bred Essex hoar, with a good grade Poland-China sow, would make a capital cross. I can think of nothing more likely to give perfect pigs, unless it is one or two more crosses of Essex blood. If white pigs are preferred, I would select good grade Chester White sows, and cross them with a well-bred Suffolk. I think the handsome litter of pigs I ever raised, was from a large grade Yorkshire sow and a pure-bred Prince Albert Suffolk boar.

ABOUT FERTILIZERS.—"A. J. C." Fairfield Co., Ohio, writes: "Much is said in the papers about superphosphate of lime, salt, plaster, etc., but I do not know of any being applied in this neighborhood, and I would like to make some experiments with them."—That is right. Try them on a small scale. I have never seen any decided benefit from the use of superphosphate on wheat. I have always seen it applied broadcast to wheat. For turnips, it is a well ascertained fact, that it is best to sow it in the drills with the seed. It has an almost magical effect on the young plants, causing a great development of roots, and a rapid growth of leaves. When superphosphate is sown broadcast on turnips, it has ultimately a beneficial effect, but you do not perceive such a marked result in the growth of the young plants, as when it is drilled in with the seed.

SUPERPHOSPHATE ON WHEAT.—I have always said that it would not pay us to use superphosphate on wheat. But some, in this section, have been using it for a year or two past. One of my neighbors used it last year on part of his wheat field, and I could see little or no difference in the crop. Another states that he also used it, and could see no benefit. Both applied it broadcast. On the other hand, several farmers who have drilled it in with the seed, report a very decided benefit from its use. In this section very few of our drills have a fertilizer attachment, and I am not sure but that these reports of the great advantages of drilling the superphosphate with the seed are made in the interest of the makers and agents of the drills with fertilizer attachments. Drilling in the superphosphate with the seed is worth trying. But it will require more evidence than I have yet seen to convince me that superphosphate is a profitable manure for wheat at present prices.

PLASTER ON WHEAT.—"A. J. C." further asks: "Will it benefit the wheat crop to sow gypsum or plaster in the drills with the seed? Will it be better alone, or will it add something to sow salt with it?"—I would drill in the plaster with the seed—say two bushels per acre, more or less. More will do no harm, and it is said that one bushel is enough. Here, when plaster is cheap, I frequently sow four bushels per acre on clover. I would not mix the salt with the plaster. There is nothing to be gained by it, and the salt, when drilled in with the seed, might be injurious. Sow from three to five bushels per acre broadcast on the land before or immediately after sowing the seed.

SALT AS A FERTILIZER.—Occasionally great benefit is derived from an application of salt to wheat, and still more frequently to barley and mangel-wurzel. The Onondago Salt Co. sell an impure salt for manure at a mere nominal price.

USING LIME.—"Will the wheat crop be benefited," asks the same correspondent, "by sowing lime on the plowed land, and if so, how much per acre?"—Lime almost invariably proves beneficial on drained land, but not on land that is wet. Whether it will pay or not depends somewhat on the price. If I could get it for 15 cents per bushel, I would use it freely. In regard to the quantity per acre there is much difference of opinion. I would put on 80 bushels per acre, or half a bushel to a square rod. The land will show the effect of the lime for many years.

WHEAT FROM OREGON.—James Aitkens, Marion Co., Oregon, sends me several heads of Chili Club Wheat. His crop was sown in the fall. Usually this wheat is there sown in the spring. I think I never saw larger or handsomer heads of wheat. I counted 126 kernels in one head. I suppose it would be claimed as an "amber" wheat, or from that to white. Mr. A. thinks it would be too tender for our climate. He says, parts of his field this year would yield 45 bushels per acre, and the only reason why the other parts do not yield so well is "simply owing to poor cultivation." "This field," he says, "and it is only a type of hundreds of others, has been in cultivation, wheat and oats, about 20 years without anything being returned to the soil. Last year it was poorly summer-fallowed, and some manure hauled on to it in places. There was a larger growth of straw where the manure was applied, but I think there was no more grain."—Probably another twenty years will change all this. I presume even now the average yield of wheat in Marion County falls very far below these figures. I do not mean by this that the land is becoming "exhausted." I think it is quite probable that the crops are as good as they were 20 years ago. But I presume that then, as now, there were a good many poor spots that pulled down the general average. Is it not so?

Bee Notes.

BY M. QUINBY.

If you failed to notice the condition of your bees last month, do not put it off another day. If the suggestions then given were carried out, the main thing now is to ascertain the amount of winter stores. It is best to weigh them. Old combs are often well supplied with bee bread, and are heavier than new combs that have more honey; 25 lbs. of clover honey is the least that is safe, 30 lbs. is safer, 60 lbs. is more than is necessary, and unless properly stored, would make wintering very hazardous. If you have no means of weighing, without more trouble than the bees are worth, let me try and give a rule for guessing at the quantity of honey. If you purchase bees before winter, you may want to feel sure that they have honey enough. Say the hive has eight combs, each containing 160 square inches, these eight combs will average half full of sealed stores, not far from 4 lbs. each. If everything has been cared for in the regular course, the outside ones will be nearly full, while those

in the middle may be a quarter or third full of sealed honey, some unsealed, and some empty cells, which the young brood has just vacated. Such a state of things is most favorable. In *guessing* at the quantity, by surface of sealed honey, another thing should be observed. If combs are straight, and just one inch and a half apart, they are more uniform in thickness and weight, than if irregular in distance apart. I have seen hives fitted up with so little care, that six frames occupied the place of eight. In a space of 12 inches, some of them might be 2 or 3 inches thick, while an inch and a quarter would be just right for sealed honey. It is more difficult to judge in such a case. . . . A visitor just related what he thought a curious fact. A new swarm of his had built two combs on one frame the whole length, true and nice. I could not help telling him that he had not frames enough for the width of his hive, or that some of them were too close. I could not quite see how he would manage to extract, or how he would find the queen, if she should happen to be between the two combs. . . . Here is another point, frames should be just so far apart, all of one size, and all alike. After all, a little too much honey is better than none at all towards the spring, but a good deal too much is fatal. Unusually thick combs when filled, are more unsafe than those of proper thickness. When the bees build their own combs, and happen to make them straight, as without frames, they are near the right distance apart. But when made crooked, the crook of each comb does not always match with the crook of the next one to it, and spaces will be left if there are no long cells to fill out with. Sometimes there will be a space rather larger than they like to fill with long cells, and not quite large enough for another comb, resulting in a thin comb with cells too short for any purpose. Hence the economy of straight combs, and having them the right distance apart. The earlier bees can be put in condition for winter the better, and the more likely they are to get through.

The early part of this month, will be the time to expect some of the neighbors to complain of bees destroying fruit. I wish that every truthful bee-keeper and orchardist, might scrutinize a little more closely than they ever before did. Whenever complaint of the bees is made, see if the bees make the attack in the beginning. If you have fruit of your own, you will have all the better chance. Watch patiently, not to shield the bees from judgment if guilty, but to get at facts. If it can not be determined in any way by watching them attentively, you can make one further effort that might prove more satisfactory. Bees are out of the way in many places, or nearly so. In most sections of the Eastern States, no more honey is accumulated after this time, and bees may as well be kept at rest as roaming about. If they were housed in a cool, dark cellar, the whole of this month, they would be better off, and the trouble would be more than balanced, by the good feeling promoted between neighbors. Carrying them in, is much better than shutting them up, which is often ruinous. Have every hive numbered, likewise the stands to correspond, and after fruit is all secured, return them for a few days, if thought necessary before winter. We may yet find there is nothing lost by housing for winter, as soon as all the brood is hatched. When the bees are set out of the way, and the pears and apples are found rotting as badly as before, the grapes punctured and spoiled for market, without the bees, I hope we shall trace the trouble to where it belongs.

The profits of bees when rightly managed, ought to repay even this trouble. I hope to be able to give some of the results of improved management next month. These results do not come from those who think that procuring a dish to catch porridge is all sufficient. The farmer's cattle must be cared for two or three times daily, for half the year. Daily care for the bees may be needed, when we learn how to apply it. We have learned this much, that whenever care of the proper kind has been given, it has always paid.

Phillip's Spiral Corn-Husker.

The machine which is illustrated upon our first page, is known as the "Phillip's Spiral Corn-Husker," from the peculiar form of the rollers, which strip the ears from the stalk, and the husks from the ears. It is run by two or more horses, and is able to husk from 500 to 1000 bushels of ears per day. Hand-machines, to be operated by two men, can husk 200 bushels per day. The corn-stalks are fed into the machine from a table, upon which they are spread out, butts foremost. They are seized by the spirally grooved rollers, and crushed, as they are drawn through; when the ear reaches the rollers, as it can not find room to pass between them, it is torn from the stalk, drops into the sloping groove, and is immediately seized by the spiked rollers, seen beneath the machine. A portion of the casing is shown in the engraving as being cut away, so that these rollers may be seen. The stalks pass to the front of the machine, from whence they are taken occasionally, and bound into

sheaves. The crushing they receive helps greatly toward their rapid curing, and makes them more easily cut in the fodder-cutter. The husks are stripped cleanly from the ears, taken by the rollers, and deposited in a box or basket beneath the machine, where they are ready to be removed for final disposal. The ears are dropped separately from the nibbins at the rear of the machine, where they may be caught in boxes or baskets, and carried to the crib. It makes very little difference in time or labor, whether the husking is done in the field, in the barn, or in the barn-yard. It depends greatly upon the condition of the fodder, if that is dry, the husking may be done in the barn, or where the corn is to be stacked. Some economy of labor, of course, depends upon the arrangement of the work. We do not say that this machine is a perfect corn-husker, by any means. That is not to be expected of any machine so recently introduced as this is. But that it is able to facilitate greatly the slow and costly labor of husking corn, we are assured, and as it is not only the best husker we have, but the only one that can be operated by horse-power, its use is one of the absolute necessities of the corn-grower.

Ogden Farm Papers.—No. 56.

I have recently had a visit from the younger member of the firm of J. I. Boies & Son, Marengo, Ill., to whose dairy allusion has several times been made in these articles. I wish I could give to every reader of the *Agriculturist* the exact impression that his statements made upon me. They contain a wealth of suggestion for enterprising farmers at the West.

Mr. Boies is young, energetic, frank, and outspoken. He and his father have had ups and downs in life, and have had some rough business experience. They have taken to their new enterprise, good natural abilities, some commercial training, and the discipline of some misfortune. Their farm contains 300 acres of land, which was bought a few years ago, as "worn out." It lies 60 or 70 miles northwest of Chicago. As already stated, they keep from 100 to 130 cows, buying all the ground feed they use—which is a great deal—and buying milk in addition to that which they make themselves, supplementing their operations with the making of much pork, and incidentally of an enormous amount of rich manure.

The first year their corn crop was 35 bushels per acre, the next 45, the next 75, and the next 96 bushels—not by an estimate or guess, but by actual weighing over their hay scales. Their dairy operations are simply stupendous; at the height of their season they make 600 lbs. per day, and will probably average 400 lbs. They last winter shipped 25,000 lbs. to one dealer in Providence, R. I., and he expects to want more this winter. They supply several large hotels in Chicago, and have a shipping custom to other points. They receive from 35 to 45 cents per lb. I did not ask especially, but conclude that their average would be rather over than under 40 cents per lb., *at the farm.*

The milk as soon as drawn, is strained into deep pans, similar to the Orange County Milk Pans, standing in an underground room, which is kept at a temperature of 60° in summer, by the circulation of air under the adjoining ice-house. The milk is skimmed at the end of 36 hours. The churning is done in a revolving four-sided box churn. The butter is washed in the churn only, thoroughly worked, and receives $\frac{1}{4}$ oz. of salt per lb. Mr. Boies is his own butter maker, and attends to every detail with great care. He has found no difficulty in making sale for his product at the prices stated above—which I consider more remarkable in view of his location, and of the quantity to be sold, than \$1 per pound near Eastern cities. Pork, of course, constitutes a very large source of income.

On my way to the St. Louis Fair in October, I hope to visit this dairy, and may write further about it. In the meantime, I am very much impressed with the fact, that there is a suggestion here for the relief of agricultural distress in the West. Butter is by no means the only product that can be made there, and be shipped cheaply to Eastern cities, for sale; cheese-making would probably be nearly as successful. The great point is so to regulate the business of the farm, that none of its crops shall be sold away. Turn everything into butter, cheese, pork, beef, mutton—something that can be transported without the enormous cost of sending grain; and the production of which will supply the farm with ample manure. It is a number of years since I have been at the West, but I assume that I no longer run the risk of criticism, if I say that even on "the exhaustless prairies of Illinois," the manure question is *the* question, and that neither railroads nor middlemen can have a tittle of the influence in dragging down Western agriculture, and making poor men of Western farmers, than can the sale of hay and grain, and the neglect to collect and provide ample manure. Naturally nine-tenths of the farmers at the West will be guilty of this neglect, and will suffer for it, blindly refusing to see the source of their misfortunes, but the few enterprising men, among whom I hope we number our readers, can not fail to be stimulated by such examples as the one set forth, to adopt and faithfully pursue a course of radical reform, looking for their money income to articles of little bulk and good price, and retaining on their farms everything that can add to the fertility of the soil.

At the West as well as at the East, it seems to me that the happiness and prosperity of farmers would be increased, by the return—if such a return were possible—to the "good old ways." I do not mean, nor do I believe, that it is desirable to produce everything consumed so far as possible upon the farm itself, for cloth can be woven in mills cheaper than in private houses, and there are better advantages for selling home produce, than existed before the era of railroads. At the same time money is too important a factor in the life of modern farmers—we have all of us been more or less corrupted by the high prices and flush money of the war times, and of the plentiful paper dollars prevailing since then, so that we have made our comfort depend too much on the ability to spend money. A farmer's income to be sure, substantial, and satisfactory, must be very largely in other things than money. An improved home, richer land, more convenient buildings, and more carefully bred and reared stock—these are within his reach without the outlay of much ready money. Home labor and the capabilities of the farm, will supply them if properly directed, and if patiently waited for, without the hiring or buying of outside helps. The tendency to measure prosperity by the amount of money that a farmer has in outside investments, or that he is able to spend for his pleasure, is giving a wrong tendency to our whole system. Farmers can not hope to compete in this respect with merchants and manufacturers, whose business is much more speculative and full of risks, and who too often give a fictitious evidence of wealth, by spending the money which they *hope* to earn, and which is not seldom lost by farmers and other producers who have trusted them.

Taking the whole merchant class of America, including their clerks and porters, they would probably show at the end of 25 years, less actual honest earning than the same number of farmers and farm-laborers. The growing tendency to spend money, and to count their wealth in dollars and cents, rather than in more substantial possessions, is assimilating them more and more to the speculative classes, whom they are so apt to decry. Let us get all the real advantage that we can out of modern civilization, but let us at the same time avoid so far as we comfortably can all that takes cash money, and gives a fleeting pleasure as our only return.

The English Agricultural Gazette has, for a number of weeks, been publishing the early education and training of successful farmers, in different parts of the Kingdom. It is almost discouraging, in view of what is so generally hoped as the outcome of our agricultural college system, to see how very few of these men had anything approaching a liberal education, and how often the 3 R's alone appear as the representatives of the schooling received. Those of our people who are longing to get out of their occupations, and to become farmers, would probably also be somewhat discouraged to see in how very few instances among those cited, the successful farmers have adopted the business late in life. Farmer's sons and farm-laborers have furnished the stock from which nearly the whole list has been drawn, and especial importance is attached in nearly every case, to very early training to hard work, and to the manifold cares of the stable and field. All this does not by any means indicate that success can not be attained, by men who have not sprung from the families of farmers and farm-laborers, nor by well educated sons of farmers, but it does suggest the importance of sound rudimentary training, and a strong inclination toward the farm rather than away from it. It makes it clear too, that farming is a business which requires no small share of energy, attention, and acquired skill; that it can not be gone into hap-hazard with only the knowledge that comes from schooling, and one or two years of experience with a good farmer. It requires thorough ingrained training in every detail of farm work, a real love for it, and a determination to succeed in it. Any young man starting life with these qualifications, may be considered safe to stay on the farm; not because of a sentimental liking for it, but for the much better reason that he knows that there he can make more money, and earn more substantial success in life, than in any other occupation that is open to him.

A friend writes me of a visit to the farm of S. J. Sharpless, in Chester Co., Penn. He says: "Sharpless has been doing well. 14 cows made last week (Aug. 6) 105 lbs., equal to 7½ lbs. each. They averaged 4½ months from calving." In a subsequent letter he says: "In mentioning the production of Sharpless' cows I forgot to say that they are running in clover half way to their knees night and day." So we may ascribe a part of the success to the Jerseys, and a part to the feed—a combination that is hard to beat.

I have long wished to identify myself with the sheep interest, which seems to me one of the most important to American agriculture, but have been prevented by the lack of suitable accommodations at home. Several attempts

made in this direction have turned out decided failures, mainly owing to the lack of sufficient fences and the inuriousness of too many dogs in the neighborhood. I have recently bought a half interest in the Cotswold flock of Mr. D. F. Appleton, of Ipswich, Mass. I hope in future to be able to report good success with them. The flock numbers about 75; it was begun with a lot of good ewes selected in Canada; and a fine imported ram, "Young America," bought from J. D. Wing, of Maple Shade. Mr. Appleton subsequently imported a lot of ewes from Howell, and 2 rams from William Lane, in the Cotswold hills in England. The rams cost \$300 each, and the flock has taken first prizes whenever exhibited at the New England Fair.

A correspondent in Iowa, who has a remarkably good Jersey cow, concerning which he has frequently written me, and whose product of butter I am satisfied is over 2 lbs. per day, asks what he shall do for a bull, as there is none available in his neighborhood, except a calf of this same cow. I reply: "If the bull-calf is sound, and was got by a fairly good bull, I should use him upon his dam, his sisters, his daughters, and his grand-daughters, as long as he lasts, unless the experiment showed some defect in its early stages. When you get such a cow as that, you had better take the chances of in-breeding and try to secure her perpetuation. I should do it myself."

In-breeding, as a rule, is of course not to be recommended, but in-breeding as an exception is often very successful, and it is always worth while in the case of a remarkable animal to run the risk, and resort to what is of course much the best means for perpetuating good qualities and establish valuable strains of blood. The experience of Shorthorn breeding is of itself a sufficient indication of the wisdom of taking such risks.

"A. M. E.," of Providence, writes: "In your Ogden Farm Paper No. 54, you say the increasing richness of the milk of native cows served by a Jersey bull may be sufficiently accounted for by the fact of their increasing age. This greater age is doubtless one reason for increased richness, but is not the latter also a proof of the influence of the male on the whole organism of the female? Darwin cites the case of a chestnut mare, which was served by a male quagga, and subsequently her foal by a black Arabian stallion, was barred like a quagga." The effect on the character of subsequent progeny by the character of cross-bred progeny is tolerably well known to most breeders. A bitch that has thrown mongrel pups can not be trusted to bring a whole litter of thoroughbreds thereafter. The same peculiarity has been noticed in other animals, and there is undoubtedly some influence exerted by progeny crossed with another breed, upon whatever it is that determines peculiarities of all subsequent progeny of the same mother. It would, however, be carrying the analogy too far to suppose that this influence on future descendants is accompanied by a transforming influence on the mother herself, at least to such an extent as to alter the character of her milk secretion. Being a champion of the Jersey race, I should be glad to claim for them any such mysterious quality as the one referred to, but I do not believe that it can honestly be done.

I have the following from Alabama: "You are not perhaps aware that it is well-nigh a universal practice in the South, with those who

make butter, to wait until the milk or cream is "turned" (as it is termed) before churning. I have seen in my neighbors' houses wooden churns charred until black by roasting them before the fire, to make the milk "turn," to "clabber" in cold weather. Here is the *modus operandi*: the milk is skimmed, and the cream placed by itself, until the last milking just before churning is brought in. Into this the accumulated cream is poured, and that is left to stand or placed near the fire until *clabbered*, and then churned.

"I think your practice quite different from the above, and would be obliged to you for a statement of your practice, together with your objections to the foregoing (if any), believing it will prove beneficial, as well as interesting, to many other of your southern readers. The southern man believes that the butter can not be gotten out of sweet milk until it makes that seemingly inevitable *evolution*. (?)

"Can you tell me why butter is always *white*, and light in weight, after the churn has sat too long by the fire?"

The practice described seems to be a cross between that of churning cream and that of churning whole milk. What it is hoped to gain by adding fresh milk to the cream, I do not exactly see, unless it is to increase the quantity of the buttermilk, retard the churning, and give the butter more firmness and more thorough washing in buttermilk, to free it from particles of curd. It would hardly be fair to the many old readers of these papers to repeat the details of our process of making butter. They are quite fully described in earlier numbers of this series. It is not exactly gracious work to find fault with the prevailing systems of any region, but it seems to me that it would be much easier to bring cream to the proper temperature by standing a metallic vessel containing it in warm water, than to heat it through the non-conducting substance of a churn; that the only beneficial effect of adding milk as described, would be equally well gained by adding sour milk, or skimmed milk of previous days—probably, in the case described, the churning of the cream of the fresh milk added is less complete than that of the older cream, a different length of time being required for its development; many persons claim a great advantage from the souring of the cream, others are equally strenuous for churning it fresh. So far as I have been able to see, the evidence is about equally divided, the opinion being generally in favor of more delicacy of taste in the sweet churning. I have never tried churning sweet milk; Col. Weld stated recently in the *Country Gentleman* that he had tested the milk of a certain cow by churning it immediately after it was drawn, and obtained a very large product of butter. It is our own practice to churn our cream sweet, and we are satisfied with the result in all respects.

The whiteness and frothiness of butter made from overheated cream, is probably due to some change effected in the casein of the milk by overheating, which prevents it being properly separated from the butter, the product being really a mixture of butter and cheese.

Flowing Water in House and Barn.

The economy of a full supply of water flowing fresh from the spring, without the labor of pumping, is only equalled by its luxury. No man ever knows how to estimate either the luxury or the economy of the thing, until it is

with him a matter of experience, after this, it becomes well nigh one of the *necessities* of life. Among the various contrivances for raising water to elevated positions, whence it may be conducted about the house, and to the barns and stock-yards, the Automatic Windmill Pump of the Hartford Pump Co., is notable for its simplicity and convenience, as well as for the ingenuity evinced in its construction, and the application of well-known principles. The reverse of the principle by which we suck cider through a straw, may be said to be shown, when by blowing air into a tight vessel filled with liquid, having an open tube descending to near the bottom, we force the liquid to spout out through the tube. This is illustrated in figure 1. A barrel, containing water, has a tube passing through the top, and going below the water. Now if we pump air in by means of an air-pump, we shall pump water out. If the barrel be submerged in a well, and has a valve in the bottom, when it is emptied of water, turning a cock in the air-pipe, to let the air escape, it will be filled with water again. Thus we might, by pumping air into a well, obtain a regular supply of water. The pump which we describe, works precisely upon this simple principle. Chambers are placed in the well or spring—anywhere under water—a windmill works an air-pump, and the water

Fig. 1.

there is no perceptible break in the flow. To accomplish this, the chambers are balanced upon a frame having a motion of two or three inches, and the buoyancy of the one filled with air is sufficient to turn a cock, which both conducts the air to the opposite chamber, and lets that which itself contains, blow off, as the water from without rushes in.

When we come to examine this interesting contrivance, we see that after all it differs less than one might suppose, from some common forms of pumps. For instance, in the old-fashioned fire-engines, see figure 2, we have two cylinders, working alternately. These are filled from below, and the water passes out from below, in the same manner, as it does in the Automatic Pump. The pressure, which forces the water out, is however, as in nearly all other pumps, applied by means of a tight-fitting piston, with its piston-rod, joints, diagonal pressure, etc., all of which involves of necessity a great degree of friction. In this pump, the air pressing upon the surface of the water, is piston, piston-rod, and all, working without a perceptible amount of friction—one may say, none at all, and with a force which has only its *economical* limits. Practically 100 to 125 feet is as high as it is desirable to force the water *at one lift*, but with a succession of pumps, this lifting may be indefinitely repeated.

The friction, or loss of power, in the slow passage of air through tubes, is exceedingly small, unless indeed the pressure be very great, and the tube small, in which case, however, the air will move very rapidly. Practically it is found that there is no perceptible loss of power, when quarter and three-eighths inch lead or iron pipes are used to conduct the air. This makes it practicable to place the wind-wheel at any desired distance from the well or spring, even a quarter or half a mile away, if a suitable position for it can not be found nearer. This

flowing water wherever needed. A fine spring is near, but below the house. The windmill, condensing the air, is upon the barn in the middle background. The air is conducted underground to the spring in which the pump is set. The apparatus by which the air-cock is regulated, is seen level with the top of the ground. The water-pipe goes from the spring directly to a tank in the attic of the dwelling, where, by means of a floating ball, the flow of water is

Fig. 2.—FIRE ENGINE.

shut off as soon as the tank is full. From the tank the water is distributed to the bath and wash-room on the second floor, to wash basins in the main part of the house, to the kitchen, and to the laundry. Thence a pipe is carried to the barn, within which a penstock and trough for the horses are set, and to the cattle yard, where another trough is placed; then either the waste water, or an independent pipe, is carried to the garden, where tubs for watering are located, or a constant flow for irrigation is maintained.

This may seem at first a great deal for one little windmill, six or seven feet in diameter, to accomplish, but from the statements made to us, we do not think it beyond credence. Besides, it should be said that whenever the tank is full, and water can be spared, a fountain may be kept playing, if the wind blows; the water coming either directly from the spring, or the waste water from the overflow of the tank being employed.

In addition to the regular daily needs for which water is used, the security against fire is very great, and a hose and nozzle should always be provided for this purpose, as well as for convenience in washing windows at the house, and carriages at the barn.

Whenever water-tanks are set for any purpose, they should be large enough to contain several days' supply of water. No ordinary family uses over 300 to 500 gallons a day. This the smallest sized apparatus is claimed to furnish, and is an abundance for all the purposes indicated in the picture, unless the stock of cattle and horses be large, or wasteful extravagance prevail. The absolutely silent working of the apparatus is a great point in its favor, as well as the fact that, though the windmill is not "self-regulating" in the ordinary acceptance of that term, it nevertheless is so strongly made that the most violent storms, except such perhaps as might unroof the barn upon

which it stands, have no other effect upon it than to make it pump the more. No rapidity of pumping can cause it to suck up gravel and so derange the pump, as windmill pumps so often do. It is necessary to oil it once a month, and this is literally all the attention it requires.

Fig. 3.—THE HARTFORD PUMP CO.'S WINDMILL AND PUMP SUPPLYING HOUSE, BARN, ETC.

may be raised to any desired height. In order to maintain a constant stream, two chambers are employed, and thus, when one is exhausted, that, is filled with air; by a simple contrivance the air is conducted to the full chamber, and the first quickly refills itself with water, so that

is a decided advantage, as springs are usually situated in valleys, where a windmill could hardly be placed to work with power and regularity, unless perhaps upon a lofty tower.

The large engraving, figure 3, represents a country place, which has all the benefits of

How to Stock Ponds with Black Bass.

Great progress has been made in the last five years in the distribution of the Black Bass, especially in New York and in the New England States. Two hundred or more ponds and lakes have been stocked, and yet we are continually receiving letters of inquiry, which show that people have very imperfect information in regard to the habits of the fish, and the best method of introducing them. Some inquire for the spawn, supposing that they are propagated like the Salmonidae. But all attempts to take spawn from this fish have been failures, so far as we are informed. Some ponds have been stocked with the fry, but it remains to be seen whether this will prove successful. The fry are very small, and remain but a few days over the beds where they are hatched, so that it requires very close watching to capture them. They are removed just at the time when they are said to have the protection of the parent fish, and they are all liable to perish in new water among other species of fish. The common and the most reliable method of introducing the bass, is to transport adult fish from well-stocked ponds to new localities. This, when properly done, has never been known to fail. In most of the States there is legal protection to the fish for three years, generally granted by special act of the legislature. But this is not long enough to secure the object. It should be in all cases five years. The fish do not bite freely until after the spawning is over in May and June, and they do not usually reach their new home until July or later, so that there is no fry from them until the second year. The fish generally selected for transfer are from one to three years old, measuring from 3 to 12 inches in length. Fish of this size are not only more numerous, but they bear transportation better, and are more readily acclimated, than when larger. They are moved with a good deal of difficulty in hot weather, especially when the journey requires more than twelve or fifteen hours. With the most skillful management, there will be a considerable loss. In the fall months there is much less loss.

There is a great want of information in regard to the character of the water suitable to this fish. We have many letters from the owners of horse-ponds, a half acre or less in extent, having neither springs nor water running through them for a portion of the year. The bass wants clear lively water with rocky or gravelly bottom, and the more of it the bet-

ter. It wants room for itself and for the poorer kinds of fish upon which it feeds voraciously. It does well in the mill-ponds upon manufacturing streams, and if the head waters and reservoirs are stocked, they will in a few years be found in all the waters below. They flourish also in natural ponds of twenty acres or more. Some decline to stock these ponds or lakes because they are generally free to the public. But this is short sighted policy. A large pond or lake stocked at a cost of one or

such progress in the Eastern States, that an order for trout, or bass, is about as readily filled as an order for Jerseys or Cotswolds.

The Beisa Antelope.

The Antelopes are a numerous family. Their principal characteristic is the cylindrical and annulated form of their horns, which in the antelopes are never angular or ridged longitudinally. The various species comprise animals which greatly differ in size; one species, which is the smallest of all horned creatures, being no larger than a hare; others stand from 3½ to 4 feet in height at the shoulders, and weigh some 800 to 900 pounds. One species inhabits our Western plains, the Prong-horn Antelope, which is perhaps the most elegant and graceful of all our wild animals. Our illustration represents one of the many species which are peculiar to Africa, and is known to naturalists as the *Oryx Beisa*. It is only since the English invasion of Abyssinia, that the animal has been observed by naturalists, and until recently no living individual had been captured. A specimen has within a short time been added to the magnificent collection of the Zoological Gardens of Regents Park, London, of which our illustration—is a portrait from life.

The Beisa Antelope differs from a well known, closely allied species, the *Leucoryx* of Northern Africa, in having straight horns, and by its peculiar markings. It is of a cream color, with black bands upon the face and legs. Its length of face is 17 inches, from its ears to the root of the tail it measures 4 feet

THE BEISA ANTELOPE.—(*Oryx Beisa*.)

two hundred dollars, and protected by law for five years, will furnish better sport to the gentlemen or company who undertake the enterprise than they could find in any small pond of their own. In suitable water black bass multiply very fast, and after they once gain possession, their numbers can never be very seriously reduced by hook fishing. The annual spawning will more than keep up the supply. There are thousands of ponds and lakes in the Northern and Middle States of from one hundred to a thousand acres, producing only the poorer kinds of fish, that might easily be stocked with bass, and add largely to the food supply of the people. It only needs the effort of a few individuals in any neighborhood or township to accomplish this good work. When the funds are raised, there is little difficulty in procuring the fish. Fish culture has made

7 inches, the tail is 26 inches in length, including the brush, which measures 11 inches. The height at the shoulders is 3 feet 7 inches, and the length of the horns is 2 feet 6 inches. The courage and strength of this graceful beast is such, that it readily attacks, and frequently vanquishes and kills the lion, and, when wounded, it charges the hunter with great fierceness. These animals feed upon coarse grasses, and occasionally browse upon the shoots of acacias and other trees. They feed in the morning and evening only, and drink at mid-day. They run in herds of ten and less in number, although single animals are occasionally met with. They are exceedingly cautious and wary, and can only be approached with difficulty. By the capture of this rare animal the natural history of Africa, of which we have so much yet to learn, has been enriched in a notable degree.

Walks and Talks on the Farm.—No. 130.

It is hard work for the horses to break up sod land during the dry weather of August and September. But with a good three-horse plow and a good point, the work can be done. And I have an idea that one good plowing in August will pulverize the soil more than two plowings in spring. When I was a boy, my father was summer-fallowing a field of rather heavy clay soil. He had plowed it three times, and cultivated and harrowed it until it was quite loose and mellow. One day he set me to roll it with a heavy three-horse roller. This puzzled me. We had been spending the whole summer in trying to lift up and loosen the soil, and now to be told to go and roll it! "Why, father," said I, "wont the roller press it down again and make it hard?" "Never again make such a remark as that," he said. "A farmer would think you knew nothing about farming. If you roll or trample land when it is wet, it will become hard and bake. But no amount of rolling will make *dry land hard*." I have never forgotten the remark. If you can break up and thoroughly pulverize clayey land seven, eight or nine inches deep during our dry hot summer months, it will not forget it for years. I think there can be no doubt on this point. The only question is how to do the work.

The field that I "fall-fallowed" in 1868, I sowed to barley in 1869, sowing it to wheat after the barley was off in the fall, and seeding it down to clover in the spring. The clover failed, and I manured the field in the fall and winter, and plowed it up in the spring, and sowed it to oats and peas, and afterwards to wheat, seeding it down with clover in the spring (1872). In 1873 I mowed the clover for hay, and the second crop for seed. This summer I mowed it again for hay. I had a grand crop. After haying, the clover grew rapidly, and I turned in all my sheep and hogs, and ate it down as close as possible. The middle of August I put in the plow. The soil is a strong loam, approaching to clay, and I expected a tough job. We put three strong horses abreast to a good plow, and I went with the man. We staked out the headlands fifteen feet from the fence, and struck out a furrow, going all round the field. I do not know how it is with others, but I find that my plowmen have a natural inclination to leave the headlands to the last, and they like always to turn the furrow towards the fence. The true way, when the land is dry, is to plow the headlands first, and plow all round the field, and turn the furrows from the fence. But to do this, it is necessary to set poles to strike out by. The way we did this is shown in the annexed diagram. We

measured fifteen feet from the fence to the pole A, and here we put in the plow, and I went ahead and stuck another stake at B, and another at C, both fifteen feet from the fence. The plowman keeps the stakes B and C in line, and is thus able to strike out a straight furrow. When he got to C, he turned "gee," and struck out a furrow to D and E, and so on to F and G, and then to H and A. We then, of course,

kept on plowing round and round until the whole headland was finished, using only two horses and short whiffletrees to turn the land two or three furrows from the fence.

"There is nothing new in all this," says the Deacon. "I never said there was," I replied. "What we want is not so much new ideas as energy enough to put in practice what we know to be right." I have a set of short whiffletrees that I use for plowing in the garden and for turning the land two or three furrows from the fences. The double tree is only 2½ feet long, and the single trees 14 inches long. I find them very useful. I have also a plow with a movable beam, that can be set so as to turn a good furrow with the near horse walking in the old furrow. In this way we can plow close up to a fence, and turn the soil away from it. Now I do not think there is anything "new" in this. But there are a good many of us who leave two or three feet of land all along the fences to produce nothing but weeds. And if this was all, it would not be so bad. But the roots of these weeds run into the adjoining land, and many a field has become infested with thistles and couch grass from our neglect in the first place to plow close to the fences, and keep our headlands clean. I often see a row of corn planted so close to the unplowed land along a fence, that the cultivator can not be used between the row and the fence. The result is that the row of corn is yellow and sickly, and not worth half the labor that is sometimes spent on it in trying to keep it clean with the hoe, and the land becomes foul. I believe this is the principal reason why my farm was in such a miserably weedy condition. The knolls on the farm are sandy and full of stones. The land could not be half plowed and cultivated on account of these stones. Thistles and other weeds took possession of these stony knolls, and the scratching of the land with the plow, instead of killing the weeds, merely served to scatter the seeds and spread the roots to the land adjacent. The headlands were treated in the same way. The fence corners were a convenient place to put stones, stumps, and rubbish of all kinds. Brambles, elder bushes, burdocks, thistles, and a long catalogue of weeds soon got possession, and not a little of the land on each side was abandoned to them. "I expected to find your farm without a weed on it," said a recent visitor, "but I find you have not succeeded yet in killing all the weeds." I asked for no explanation. I knew very well what he meant. I have contended that weeds *can* be killed. But I never said that I had succeeded in making my farm clean. I have said a great deal on the subject, for the simple reason that the destruction of weeds has occupied much of my time and thoughts. I sometimes get discouraged. It is an unceasing fight. It has to be renewed every year. But I am gaining on them.

Looking at the trouble I have had in killing weeds and in restoring the condition of a run-down farm, it seems strange to me that so many intelligent and well-to-do farmers spend so much time and money in building fine houses and ornamental barns and fences, and so little in draining and in improving the condition of the land. Solomon says: "Prepare thy work without, and make it fit for thyself in the field, and afterwards build thine house." It seems to me that there are a good many farmers who would do well to heed this proverb.

While the Deacon and I were talking and looking at the sheep and pigs, William has been

plowing. Perhaps two of Crozier's Clydesdale horses might plow this land, and turn a furrow 7 inches deep and 10 inches wide. Here we put on three horses, and turn a furrow 15 inches wide. Such a furrow, one mile long, turns over 6,600 square feet, or over one-seventh of an acre. If the horses travel a mile and a half an hour for eight hours, exclusive of turning, they would plow (1.8), say 1¾ acres; if two miles an hour, they would plow in eight hours (2.4), nearly 2½ acres. With a 10-inch furrow, the same distance of travel would plow less than 1½ acre, and a little over 1½ acre respectively. In England an acre is considered a good day's plowing, and three-quarters of an acre is a fair average. When an American talks about plowing two or three acres a day, an English farmer shakes his head. He cannot understand it. And yet if the English horses walk one-third slower, and the plowman works one-third less time, and the plow turns one-third less furrow—if the Englishman plows one acre in the day, the American would plow 3¾ acres!

"I should not think it would make all that difference," said the Deacon. "Figure it out yourself," I replied, "perhaps I have made a mistake, though I think not. At any rate, it is certain that we usually plow much more land in a day, than they do in England and Scotland—probably on an average not far from double. "You are now plowing nearer 18 inches than 15 inches wide, I think I never saw you plow so wide before. You have always advocated narrow furrows." We will not discuss that question now. What I want you to observe, is the splendid condition of this land. It turns up beautifully. It has a rich look about it. It crumbles all to pieces. It has not forgotten that fall-fallowing we gave it six years ago, nor the top-dressing of manure in the fall and winter of 1870.

The Deacon and some other farmers thought I should lose half the value of the manure, by spreading it on the surface. They thought it should be plowed in. They have great faith in the mechanical action of manure. They think it lightens the soil. There is some truth in this, but I have more faith in underdraining, good and repeated plowings, and thorough cultivation, in connection with rich, well decomposed manure.

"Yesterday," said the Deacon, "a farmer took a load of clover hay to Rochester, and all he could get for it was \$10 per ton. Another farmer took a load of wheat straw, and sold it readily for \$12 per ton. This does not look as though farmers had much faith in your chemical notion, that the manure from a ton of clover hay is worth three times as much as from a ton of straw. The facts seem to be against you." "So much the worse for the facts," I replied. "But I am not going to argue that matter with you. There are some things so well established, that it is no use listening to the objections of those who do not understand what they are talking about. A farmer who sells clover hay at the above prices, and keeps his straw, is not a wise man. When he can exchange a ton of straw for half a ton of bran, he had better do it."

"You pretend to be able to tell," said the Deacon, "what a ton of manure is worth, but I notice that the chemists differ very much among themselves, as to the value of the same identical manure, and I do not see how you can tell with any certainty how much good a ton of manure will do." No one pretends to do so.

What we say is this: Here are two samples of baru-yard manure in about the same condition. One contains twice as much nitrogen, phosphoric acid, and potash, as the other, and we say, if the one is worth \$1 per ton, the other is worth \$2 per ton. We do not say that if you put 20 tons of the former, or 10 tons of the latter upon an acre of land, the difference of the crops will be worth \$20. This may or may not be the case. The chemist's estimate of the value of different manures is based on their chemical composition, and on the condition of the ingredients. The chemist does not undertake to tell a farmer, whether he can afford to buy sulphate of ammonia, or nitrate of soda, to sow on his wheat or barley crop. But if you are going to sow these manures, the chemist can tell you to a certainty which of two samples is the cheapest for you to buy. For instance, he finds one sample contains 22 per cent of ammonia, and the other 18 per cent. If he tells you the latter is worth \$72 per ton, and the former \$88 per ton, he merely uses these figures in a comparative sense. If he should say the one was worth \$36, and the other \$44, he would be equally correct. He has nothing to do with the commercial value on the one hand, or the fertilizing value on the other. The latter must be determined by the experience of farmers themselves, and on repeated experiments. Where wheat is worth only 75 cents per bushel, and other crops on the same scale, ammonia is only worth half as much to a farmer, as in a section where wheat is worth \$1.50 per bushel. When an agent for some artificial fertilizer shows me a whole string of testimonials, as to the value of his fertilizer, I tell him that a good analysis would be more satisfactory to me, than an actual trial on my own land and under my own eye. A man need not swallow a lot of Glauber salts to tell if they are pure. The chemist can not tell him whether he needs a dose of the salts, but he can tell him whether the salts are genuine or not. Chemistry can not tell us whether our land needs this or that manure, but it can tell us whether the manure is genuine or spurious. If farmers had clearer views on this subject, the sale of inferior or worthless fertilizers would soon cease.

At the present price of corn, fine middlings, and pork, there is more profit in feeding pigs in this section, than we have enjoyed for some years. Furthermore, lard is in good demand, and packers discriminate in favor of fine boned well-fed hogs. In Chicago, "grassers" are quoted at 5 cents per pound, and dull of sale, while an extra, choice, well bred and well fattened pig, would bring 8 cents live weight. This is as it should be. The latter, even at this greater difference in the price, is far cheaper to the consumer than the former. And it makes quite a difference to a farmer, whether he has fifty "grassers" weighing 175 lbs. each to sell at 5c. per lb., or fifty choice, well bred and well fed pigs, at the same age, that will average 300 lbs. at 8c. The former lot will bring \$437.50, and the latter \$1,200.00. We ought to produce the best pork, lard, and hams in the world, and secure the highest prices in the English market. Instead of this, Irish hams are quoted in London, at 22 to 24 cents per lb., and American hams at 13 to 15 cents. And there is a corresponding difference in the price of pork. I asked Mr. DeVoe, our largest pork packer, what was the reason American pork sold so low in Europe. "Vot is the reason," he exclaimed, "I will tell you why. Ve

think they are vools over there. Ve think anything is good enough for them. Pork that ve would not eat here ve ship to Europe. I sent several barrels of pork as a present to my friends in Germany, and they said it vas most excellent, but that most of the American pork they got vas vile stuff. The Captain of a steamer running from Hamburg to New York, vonce gave his crew American pork on their return voyage. Great vas the grumbling. And ven they got to Hamburg they refused to continue on the ship until the captain had given them a written agreement, to never again give them American pork!"

A large grocer and provision dealer in Staffordshire, once told me that he bought a quantity of Ohio bacon, and retailed it out at a good profit, and with much satisfaction to his customers. The next lot he bought was so poor that he could not dispose of it. "Since then," he said, "I have been afraid to deal in the article. If it was always as good as that first lot, I could sell large quantities." For many years we had the same state of things in regard to American cheese. Our cheese factories, however, are now making so good an article, and there is so much greater uniformity in the quality, that American cheese, I believe, commands as high a price as the best Cheshire. It will in time be so with American pork, bacon, hams and lard.

As a rule, the price of agricultural products in Europe determines the price in America. Hitherto the cost of labor here has been double and treble what it was in Europe. Our products had to compete with the products of this cheap labor, and pay freights over long distances into the bargain. We have been able to compete, because we lived economically and worked hard, and because our land was cheap and comparatively rich in what I have called "natural manure." We have grown cheap wheat and corn on our new land, because we have to pay no "rent," and because every bushel of wheat we have grown has found an amount of manure in the soil, which would have cost the English farmer at least 50 cents. We are now getting less and less of this natural manure. We find an increasing necessity for furnishing manure to our land. We should now find it a hard matter to compete with the English and European farmers, if they could get labor at the old rates. But fortunately for us, and fortunately, as I think, for them and all concerned, labor is now nearly or quite as high there as here. This places American farmers on a far better footing than ever before. Owning instead of renting our land, with a favorable climate, a rapidly increasing population, improved implements, and comparatively intelligent and skilled labor, we have good reason to take courage and push ahead with our improvements.

ENFORCE THE DOG-LAWS.—Sheep raising is undoubtedly looking up. Wool brings satisfactory prices. Early lambs are in brisk demand, and the market would take a great many more. We can have mutton, at least in winter, and farmers look cheerful in view of the profits of the flock at the close of the year. The pastures, where the sheep have been, are blooming with white clover, and the increase of grass and the reduction of brush are strong points in favor of sheep husbandry. But the dogs still worry the flocks, and kill sheep, notwithstanding the legislation against them. Some of the States have good laws for the pro-

tection of sheep. The owners of dogs have to pay a license for every cur they keep, and the money goes into a fund to pay for the losses of sheep owners made by dogs. This is a great security. It not only reduces the number of dogs, but pays for the damage they do. What is now most wanted is the strict enforcement of the law where one exists. Make every man pay for his dog, and kill the unlicensed.

Wheat without Manure.

Our readers have been frequently advised of what has been done by Mr. Lawes of England, in the way of raising repeated crops of grain upon the same land year after year, both without and with manure. But Mr. Lawes' labors have been experimental. We have now before us a report of the sales of the standing crops of wheat, oats, and clover upon two farms in England, upon which these crops have been raised successfully for a dozen years, and sold standing, to be cut and carted away by the purchasers, both straw and grain together. No stock is kept upon these farms. No manure is used upon them. Deep plowing by steam, and draining to further deepen the soil, are the only means by which these crops are produced year after year. One of these farms is owned and cultivated by Mr. Prout, of Sawbridge-worth, and consists of 450 acres. The present season's crop was chiefly wheat, which, sold by the acre as it stood, realized from \$45 to \$89 per acre, for grain and straw. The purchaser in all cases does the harvesting. The average prices were, for wheat, \$54.40 per acre; oats, \$49 per acre; and clover, \$52 per acre. The whole proceeds of the 450 acres were \$23,141, an average of \$53.30 per acre. The average result of the past seven years' crops has been \$51.25 per acre. The farm was purchased twelve years ago, and was then in poor condition. It was drained, and \$4,000 worth of chemical fertilizers were used, to bring it into a producing state. Since then it has been cultivated deeply by steam each year, but no fertilizer has been used, nor has the straw even been retained upon the farm. The other farm is owned by Mr. Middleditch, of Wiltshire. It has been managed upon the same plan. The crops upon this farm brought from \$18 to \$36 per acre, or an average of \$55. The aftermath of some fields of sanfoin, which were to be pastured by sheep, sold for \$10 to \$18 per acre. There are 500 acres in this farm. Both farms have a clay soil, and are fairly good wheat lands, but at the commencement of this cropping were much run down. The farmers who purchased the crops, and some who had taken them for several years, said that those of the present year were the best crops for several years, and Mr. Prout expressed the opinion that he could thus farm "as long as he lived, and his son after him." We do not pretend to make any application of this anomalous kind of farming, but merely give the facts. At the same time we can not refrain from comparing it with some farms we have seen, in the rich valleys of Ohio and westward, where for twenty years the merest scratching of the deep, rich soil, and the raising of wheat upon the unplowed corn-stubble, year after year, has made farmers comfortable, if not rich, and thinking at the same time, that it is possible, if those rich lands were better treated, and farmed more with the plow, and less with the harrow, that they might produce better crops than they now do, and remain profitable to their owners for an indefinite number of years to come.

Ice-House and Cool-Chamber.

The principal requisites for an ice-house with a cool chamber below it for milk or fruit are, a locality where the ice can be conveniently placed in the upper part, and where there is drainage to carry off the waste from the ice. A hill-side is the most convenient position for such a house.

Fig. 1.—INTERIOR OF COOL-CHAMBER.

The method of construction is the same as for any other ice-house, excepting in the floor. The walls are double, and are filled in between them with sawdust or other non-conducting material. The roof should be wide in the eaves so as to shade the walls as much as possible, and it will be found convenient to have a porch around the building, on a level with the floor of the ice-house.

Fig. 2.—MR. RANKIN'S COOL-ROOM.

The floor of the ice-house must be made not only water-tight, but airtight. If a current of air can by any means be established through the floor of the house, the ice will melt away in a very short time. A double floor of matched boards tarred at the joints, and between the floors, should be laid. The joists are placed so that the floor

Fig. 3.—ELEVATION OF ICE-HOUSE.

slopes from both sides to the center, to collect the waste water from the ice; a channel is made along the center to carry it to the side of the building, where it is made to pass off by means

of a pipe with an S curve in it, to prevent access of air. Or the pipe may be brought down through the lower chamber, and made to discharge into a cistern, in which the water is kept always a few inches above the level at which it is discharged from the pipe. The method of this arrangement of the floor is shown at fig. 1, which represents a section through the floor and lower chamber, in which the shelves are seen. Fig. 2 shows the patented arrangement of Mr. Rankin, of Denison, Texas, and Emporia, Kansas, which he has adapted to the refrigerator cars, in which fresh beef is brought from Texas to the Eastern markets. Although this is patented, Mr. Rankin makes no charge for the use of it, except the nominal one of one dollar for each ice-house, and it is therefore practically public property. The ceiling of the lower chamber is made to slope, as shown in fig. 2, and may be covered with sheet zinc. Above the ceiling there is the usual non-conducting layer, and a floor sustained by the usual joists upon which the ice is packed. The coldness of the ceiling causes the moisture of the lower room to condense upon it. This moisture runs down the slope, and drops into troughs or gutters of zinc, which are suspended beneath it. From these it is carried off into the cistern, which collects the waste water from the ice above.

Such cool chambers as either of these may be used to preserve fruit, meat, vegetables, or other perishable matters. Some ventilation and circulation of air in them is necessary to prevent mould or mildew, and it would be preferable to build the lower story of brick or stone rather than of wood. The upper part of the building could be built of wood as well as of any other material. A temperature of 40 degrees has been maintained in such a chamber throughout the summer, but this can only be done where the soil is very dry and gravelly. The elevation of the building is shown in fig. 3.

A Large Underground Cistern.

The supply of water needed for a stock farm is very large. One large cistern may be built for much less than several small ones of no greater total capacity.

A correspondent sends us a description of his cistern, which holds nearly 30,000 gallons, or over 700 barrels of water. This cistern, which we here illustrate, is 20 feet in diameter, and 12 feet deep. It is lined with brick set in cement, and is arched with brick, and covered with earth to keep the water cool. That the spread in the arch may be reduced, there is a brick column in the center from which the arch is made to spring all around. The engraving shows

a section through the middle of the cistern, with the pillar in the center of it. The central pillar needs to be well and substantially built, as it supports half the weight of the arch and

covering. It should be at least two and a half bricks thick, and square. The cistern here represented, is situated upon the highest ground of the farm, and is supplied from a well by means of a windmill and force pump. The

SECTION OF CISTERN.

water is brought in pipes by its own gravity, to the house, stables, and garden, and in seasons of drouth is used to irrigate the garden. There are many conveniences in all this, which make it a very desirable cistern, and its real value on a farm is much greater than its cost.

A Safe Tether, or Picket Pin.

The disuse of fences either in whole or in part, renders a secure method of tethering an animal of great use. Stakes are easily loosened or battered to pieces by driving them, and the tethering rope is frequently wound around them. If a strong iron rod be bent into the shape of a corkscrew, with a loop at the upper end, it may be screwed into the ground, and will then hold the strongest animal safely, while the rope cannot be wound around it. This implement will also answer the purpose of a post to hold guy ropes for shears, or any other similar purpose, or to fasten the lower block of hay hoisting tackle, when working with the hay fork. Indeed there are many uses for this little contrivance, which will suggest themselves. The illustration represents it as fixed in the ground. One of its advantages, and not the least of them, is that it is readily set in place, and as readily removed, without the

A SPIRAL TETHER-PIN.

use of a hammer to drive it or knock it loose. A short stout stick like an auger handle put through the loop, is all that is needed.

The Barn Sheet.

The Barn Sheet is a very useful thing to have in every barn. Every harvest it will save more than its cost in grain, that would otherwise be scattered upon the field or the barn floor, and go to waste. When loading oats or buckwheat especially, the saving of shelled grain, by having the sheet in the bottom of the wagon, is often equal to the amount of the seed. It is also useful to spread over a load of hay or grain that may be caught in a sudden shower, or over

a half finished stack. It will serve to cover up a carriage and preserve it from dust. Many other uses will suggest themselves to the careful farmer who has provided himself with one. It may be made of four widths of yard wide stout sheeting, four yards long, strongly sown together with linen thread, and with a strong cord bound into the outside hem. It would be better to have a coat of linseed oil, which would make it nearly water-proof, but without this, if placed over a stack, the top of which is well rounded up, it will turn a steady rain of 24 hours' duration. The cost of a sheet like this being so insignificant, and its uses so obvious, it should find a place in every barn.

Fig. 1.—STATIONARY BAG HOLDER.

Bag Holders.

Two of these useful contrivances called bag holders are shown in the accompanying engravings. That shown in figure 1 consists of a box with flaring sides, which is made to operate as a spout to receive the grain or whatever is to be poured into the bag. At the bottom of the box a few small hooks are fastened, by which the bag is held. The box is supported by four light iron or wooden rods upon a bottom board. This board may be mounted upon wheels if desirable. Figure 2 shows another style, which may be folded in a small space when not in use. It consists of a bottom board with an upright at one side; a pair of arms are pivoted to the top of the upright. These arms are fastened together by a cross piece, to which a brace is hung by a hinge. This brace is made to sup-

Fig. 2.—ADJUSTABLE BAG HOLDER.

port the arms in a horizontal position, by means of the notches upon the upright post, into which the end is made to fit. A button is also fitted upon the upper side of the cross piece by which the bag is held. To place the bag in the holder the edge is passed over the button and turned

down; it is then turned over the projecting points of the arms, by which it is held securely while being filled. The dotted lines in the engraving show the manner of turning the edge of the bag over these parts of the holder.

Pasturing Cows in Apple Orchards.

In riding through Normandy last autumn—a country filled with orchards—from the apples of which, cider, the universal beverage of the district, is made, the writer saw a great number of cows pasturing on the rich grass under the trees, and eating the fallen apples. Every cow was rigged with a sort of rope harness, to the girth of which was attached a short halter that prevented her raising her head to take apples from the trees. The contrivance was exceedingly simple and cheap, and

there is no reason why it might not be adopted by the farmers in this country who would gladly pasture their orchards except for the damage done to fruit and branches by cows whose heads are free. The halter should be as short as will allow the head to be raised to its natural level; there will then be no danger of its being caught by the foot. This is not only more effective, but much less objectionable than the

HARNES FOR A COW.

method sometimes practiced with us of tying the halter to one of the forelegs. The cow when harnessed in this manner, walks about, lies down, and rises up, with perfect freedom.

Remedies for Hen Lice.

As the summer heats increase hen lice multiply and the broods need constant looking after. It is a safeguard to put tobacco in the nests of sitting hens. Refuse tobacco or old stems will answer the purpose. If lice are already in the hennery make a strong decoction of tobacco and apply it with a syringe all over the inner surface. Sulphur sprinkled in the nests and about the roosts is also a good remedy. Insects do not like the smell of brimstone. Another remedy much used recently and very easily applied is kerosene oil. Strips of larding from the tailor's shop are tacked upon the roosting poles, and these are saturated with the oil. The hens upon the poles get some of this oil upon their feathers, and wherever it touches it drives off the insects or kills them. Carbolic acid is another cheap destroyer of insect life. It is largely diluted with water and applied to all parts of the house. If, in very old houses, one application is not sufficient, repeat it.

Water Trough for Barn Yard.

In the barn yard at Mount Fordham, we recently saw a water trough for cattle, which we here illustrate. It is calculated to prevent cows from indulging their favorite pastime of hooking or punching their companions, or keeping the weaker members of the herd from the water. The trough which contains the water is enclosed in a circular box, and there

WATER TROUGH FOR BARN YARD.

are several partitions which separate the drinking places from each other. Holes are cut in the upper part of the box through which the cows can drink, and by this contrivance the water is kept clean. Something similar to this has long been in use in our own yard for watering sheep; the great advantage is that the sheep can not crowd each other from the water, or wet their wool, which in winter time is injurious to them.

Fastenings for Barns and Out-Buildings.

"Safe bind, safe find" has reference to barns and stables, as well as houses. It is frequently the case too, that suspicions unjustly aroused would be prevented, if barn, stable, and granary doors were kept securely fastened. A simple, cheap fastening, that is more secure than padlocks, and harder to be picked than locks, is here illustrated. It is one that we have ourselves used upon farm buildings, including pig pens, chicken houses, and corn cribs, and it has the advantage, which is not inconsiderable, that one key opens every door. The key, too, is of such a character, that it is not easily lost, and if it should be lost, it can be readily replaced. The key-hole

Fig. 1.

Fig. 2.—BOLT.

is a plain round hole, half an inch in diameter, in the door. The key is a bar of round iron, hinged in the middle, and furnished with a handle, as shown in figure 1. The lock is a simple sliding-bolt, upon which a projecting piece is fastened, as shown in fig. 2. The bolt is shot back and forth by the jointed key, the end of which, when it is inserted into the key-hole, drops down, and catches against the projecting part

Fig. 3.

of the bolt, as in figure 3. To make the bolt perfectly secure against a dishonest attempt, any secret device or arrangement, to fasten it in its place, may be adopted, such as a wedge or a pin, moved by a string, or every door in a barn, but one, may be fastened inside, and only one left to be fastened from the outside, which will greatly add to the difficulty of entering to any unauthorized person.

For an in-door fastening, to be used in passages where cattle or horses pass and repass, the bolt shown in figure 4 will be found safe and convenient. The sharp projecting part of the bolts in common use, is dangerous to passing animals, but if a round bolt is used, and the projecting part, by which it is slipped back and forth, is made heavy, or long enough, to cause the bolt to turn, and let it drop downward, there is nothing to interfere with the animals or harness in passing. It is one of these little conveniences, which are so small as to be overlooked, but which nevertheless often prevent less or more serious trouble.

Fig. 4.—BOLT.

Progress in reclaiming Salt Marshes.

We hardly know how to account for the very slow progress made in reclaiming the fertile salt meadows along the sea coast. It was demonstrated nearly twenty years ago, that these marshes can be reclaimed and made to yield large crops of clover, timothy, and red-top, and indeed all farm and garden crops. For the upland grasses they need only to have the sea-water shut off by dikes and tide-gates, and very little surface drainage. Yet, with millions of acres of these meadows along the sea-coast, not one in a thousand has been improved. These lands are generally owned in small parcels by farmers, who oftentimes live at a distance, and value the salt hay for the change of food it gives their cattle in winter. A marsh frequently embraces a thousand or more acres, owned in a hundred or more parcels, and to drain it requires concerted action. This is quite difficult to secure, especially when capital is to be raised to secure the improvement. Farmers are averse to change—slow to believe any thing they do not see with their own eyes. Yet there are some readers and thinkers among them, who are wide awake to improvements, and have faith enough to travel and see what the rest of the world is doing. Numerous small patches on Long Island, and New Jersey, and in New England, have come under our observation, and there are several large tracts in Massachusetts, so completely successful, that capitalists can no longer hesitate to put their money into such enterprises. Among the earliest of these improvements was a marsh of nine acres at Stonington, Conn., diked by the railroad embankment, and furnished with a tide-gate in 1855, with which the old readers of the *Agriculturist* are familiar. Though that reclaimed land has passed into other hands, and the tide-gate is not properly guarded, it still furnishes good pasturage and hay, and is much more productive than the adjacent upland. The marsh of James A. Bill, in Lyme, on the banks of the Connecticut River, yielded luxuriant crops of hay for many years, and was finally changed to a cranberry bog. No case of

failure, when the tide-gate has been kept in repair, has come under our observation. A new interest is awakened in Massachusetts by the great success in reclaiming the large Marshfield marsh of 1,400 acres. The sea-water was first shut out in November, 1872—after years of talk, labor, and persecution, such as the pioneers in such a work alone can appreciate. The barrenness, ruin, and disaster that were predicted have not taken place. Instead, there has been an increased growth of the grasses that have sprung up among the waning salt-grasses. The yield of hay surpasses all expectation, and it is of excellent quality, far superior to salt-hay. As yet there is no well digested plan for introducing the upland grasses. In an experimental way, small patches of timothy, red-top, and clover have been sown on the surface without any preparation. The marsh has not been plowed, and this will not be necessary to stock it with these grasses. The salt-marsh sod is like a sponge, and grass seed catches upon it quite as readily as upon prepared upland. There are isolated patches of red-top that will probably cut three tons to the acre this season. Red-top seems to be admirably adapted to these reclaimed lands. Other grasses do well so far as they have been experimented with. The coarse salt-grasses near the creek are nearly all dead, and will soon disappear entirely. The experiment is a complete success, and the mouths of the gainsayers are effectually stopped. Grass four feet long, and timothy plumes five and six inches in length are arguments not easily answered. The estimates of the value of these lands made in the *Agriculturist* twenty years ago are fully realized. In many of the older States there is no more promising field of investment in agricultural improvement than in these salt marshes.

A Home-Made Brush.

By and by the time for slaughtering hogs will arrive, and a great many bristles will be thrown

MAKING A BRUSH.

away and wasted. The following plan of utilizing them is sent to us by a correspondent. Take a piece of strong wood, and shape it like a brush handle, and split it at the thick end with a fine saw, as at *a* in the engraving. Place the bristles with their butt ends in the split on both sides. Tie the end of the split stick with waxed twine, and fasten it, (see *b*). Then turn down the bristles, and wrap them with waxed twine firmly and smoothly, making a brush, (see *c*) that will answer all the uses of a purchased paint brush upon the farm or around the house.

A CALIFORNIA FARM.—A farm in California has lately been rented for \$40,000 per annum. It consists of 20,000 acres, and is stocked with 1,900 head of cattle, 100 horses, 50 mules, and 1,500 hogs. The lessee purchased

the stock and the standing crops for the sum of \$74,250. This farm is all arable land. The possession of large tracts of land under old Mexican grants, makes this extensive farming possible in California. How long it will last under the system of agriculture prevalent in that State, is a question. Such a farm is an anomaly in American farming, and we believe the like can be met with in no other State.

Drill Sowing Wheat.

Every year's experience is in favor of drilling wheat. It shows more and more that, as against sowing the seed broadcast, it is economical in labor and in seed, and gives a better crop. The difference in labor is at least \$1.00 an acre, or the cost of two harrowings after sowing, or one cultivating. The difference in seed is at least half a bushel, or 50 cts., to \$1.00 an acre, and the difference in the crop is fully one-fourth, or upon fairly good soil, six bushels or nine dollars per acre. Eleven dollars per acre upon ten acres, will more than pay for the best drill made, which will sow ten acres a day. But if the means of purchasing a drill are not available, and there are less than ten acres of wheat to be sown, it will yet pay to hire a drill, which may be done from some neighbor, fortunate enough to possess one, for 50 cents per acre. We have not yet seen a part of the country, where a drill could not be purchased or hired, and very few fields upon which a drill could not be used, if the ground was properly prepared. It is one of the greatest advantages resulting from the use of machinery upon farms, that it to a great extent necessitates good farming. At least that it compels improvements, and the farmer who once enters upon the march of improvement, rarely stops and never turns back. Thus when a drill is used for the first time, the farmer finds his crooked fence in the way; his narrow gates, or his awkward bars are inconvenient, the brush and weeds around his fence interfere, his poor plowing is troublesome, the banks and hard spots that have been left, a nuisance to him, and the weeds, trash, rough clods, and stones upon the surface, are a severe tax upon his patience. The next season all these faults will be remedied, because discovering the profit of the machine, he is obliged to prepare for its use. This is like the entrance of light into dark places, and a number of things that were never noticed or suspected before, are now so conspicuously apparent, that they cannot be any longer left undone. The same is true as to the use of the mower or the reaper, and thus the money spent for any of these needful machines, is repaid in more ways than one.

The Position of Windows in Horse Stables.

We find in a German exchange some curious observations on the manner in which the position of the windows in the stable affects the eyes of a horse. In one instance the horses of a farmer,—fine animals, celebrated for their excellent condition, were kept in a stable lighted only by a small window at one side. When light was needed for work, the door was temporarily left open; the result was that nearly all of these animals had eyes of unequal strength, and in time a number of them became blind on the side toward the window. A strong light directly in the horses' faces has been found to weaken the sight. The worst position of all

for a stable window is in front of the horses and much higher than their heads. An officer had bought a perfectly sound mare from a gentleman whose stable was lighted by windows at the rear of the stalls. The animal was sound and perfectly satisfactory. After three months she became suddenly "ground-shy"; on examining her eyes they were found directed upward, and this was explained by the fact that the windows of the officer's stable were situated above the head of the stalls, the eyes being generally drawn in that direction. She was removed to another stable, where the light was admitted from all sides, and in three months time the difficulty had disappeared.

Another officer reports that during the campaign of 1870, in France, he rode a horse that was a capital jumper. On his return from the war, he placed this animal in his stable, the windows of which were above the front of the stalls, and in a short time the horse became so shy of the ground that he had to sell it. He had had a similar experience with other saddle-horses, all of which became ground-shy in his stall. One animal in particular, a thoroughbred mare, renowned for her jumping qualities, refused in a short time to cross the smallest obstacle, and when forced to cross a foot wide gully, made a leap that would have cleared a ditch fourteen feet wide. Owners of horses who find that their animals shy at objects on the ground, or at their side, would do well to look to the windows of their stables for an explanation of the evil.

A Portable Poultry House

A correspondent sends us a plan for a portable poultry house, which can be readily

Fig. 1.—ELEVATION OF HOUSE.

moved from place to place. It is shown in figure 1. The size of the building is immaterial, so that it is not made too heavy to be moved by one or two horses. The building is raised upon sills, which are

Fig. 2.—END OF HOUSE.

also the method of putting the building together. Figure 3 gives the ground plan. The

nests are seen at *a, a*, the water-fountain is shown at *b*, and the roosts at *c*. Similar portable houses have been found very useful in

Fig. 3.—PLAN OF INTERIOR OF HOUSE.

many places, where a removal to fresh ground is necessary for the comfort of the fowls.

Prize Farming in Ireland.

The offer of prizes of small pecuniary value for excellency in the management of farms, has been found to have a remarkably good effect in Ireland. Whether or not something of the same kind might have a similar result with us, were our agricultural societies to offer premiums for the best cultivated and improved farms within their jurisdiction, it is of course difficult to say. Doubtless, as a means of greatly benefiting agriculture proper, a portion of the funds of State or County Associations might well be diverted from the fostering of the fast horse interest, and appropriated to this purpose. But whatever might be the result, if it be attempted in this country, it will be instructive to note what has been done in this way to improve the condition of agriculture in Ireland. It is only since the year 1870 that the principles of agriculture have been taught in the public schools of Ireland, and school-farms or gardens have been cultivated in connection with these schools, as practical illustrations of the lessons taught. These have been very successful, and have greatly aided in improving the condition of the small Irish farmers, most of whom, or 317,457 out of 608,864, occupy farms of less annual rental than \$40. As an additional encouragement to improved cultivation and homestead arrangements, the Irish government has given, through the Commissioner of National Education, twenty-four prizes, three for each of eight districts, in which there are school-farms, of the value of \$17.50, \$12.50, and \$7.50 respectively, to be distributed annually, for the next five years. The conditions are simply that the farms shall be of not more than \$40 annual rent, and that the successful competing farms shall be adjudged to excel in neatness and cleanliness of the house; in the amount and quality of the produce of the land; in the character and condition of the stock, which includes all live stock kept for profit, from horses down to bees; and in any other circumstances that may attract favorable notice. A successful competitor can take no more than three prizes in five years, and prizes are not given, unless the farms are sufficiently meritorious, and deserve them. The examinations for the award for the present year have recently been made, and the judges' reports published. From them sufficient can be gathered, to show that the expenditure has been productive of a vast public benefit. On all the farms which competed, the improvements were very remarkable. The educational results were conspicuously shown by the greater money profit derived from the farms, in consequence of their improved management; so that, should

the prizes be withdrawn at once, the benefit would be a permanent one. The homesteads have been fenced in from the public road, and

surrounded with gardens; gates have been hung; calves and pigs of improved blood have been raised; manure has been collected, and composting has increased its quantity and quality, and in the process cleanliness of yards and stables has been inaugurated. In several cases the increased income of the farms in two years has enabled their owners to make deposits in the savings banks, and thrift and economy have generally superseded carelessness and poverty. In one case a woman, who farms 15 acres of land, has won a prize; she was the daughter of a farmer who had died, leaving a dependent family, and had been a pupil at one of the schools where agriculture is taught. Another successful competitor had never before had a field of clover or turrips, but now has adopted a rotation, in which these ameliorating crops occur, and exhibited fields of each in excellent condition. His farm is said to be a model of clean cultivation and productive crops. He has made money by these improvements, and will never abandon them. Another competitor's farm, which last year was very foul with weeds, was found entirely free from them this year. The competition has brought many of these small farmers into popular distinction, and made them men of mark. Some of the farms are visited by other farmers from far and near, much enthusiasm has been awakened, and the spirit of improvement is active and general. While appreciating the difference which exists between farming and farmers in Ireland and in the United States, there is yet ample opportunity here for improvement, similar to that here related, which might be started by a similar agency.

EGG INSPECTION.—The Butter and Cheese Exchange of New York, recently adopted a system of inspecting eggs sent to that market. It has been in operation a sufficient length of time for the results to be ascertained, although it has not yet reached a point where it works with perfection. The chief inspector reports that the system has so far met with the approval of both shippers and dealers. The system adopted is as follows. Each shipment of eggs is sampled on its arrival, by taking five or ten barrels and examining the contents; the average condition is held to represent that of the entire lot. When an unusually bad barrel is discovered it is thrown out, so that it may not unduly reduce the average of the shipment. The discarded barrels are received on their exact merits. The cost of inspection is 75 cts. a barrel, and the advantages are so obvious, that shippers have so far willingly submitted to the cost. One good result is that shippers have already taken greater care in preparing their packages for market, and it will be much to their profit, if every one would judiciously select and carefully pack all the eggs they may ship for sale. Now that one innovation is tolerated in the egg trade, we may hope that the long needed improvement of selling eggs by weight may be considered. Nothing is more absurd than selling eggs by count, as some are twice as heavy and are worth twice as much as others. Weighing the eggs would be more just.

Spring-Houses.

There is no better method of preserving that equable temperature, which is necessary for the best management of a dairy, than the use of a permanent spring of water. In winter and summer the temperature of water, which

The points necessary to look at most particularly in constructing a spring-house are, the coolness of the water, the purity of the air, the preservation of an even temperature during all seasons, and perfect drainage. The first is secured by locating the house near the spring, or by conducting the water through pipes, placed

be covered with wire-gauze, to prevent insects or vermin from entering the house. The house should be smoothly plastered, and frequently whitewashed with lime, and a large ventilator should be made in the ceiling. There should be no wood used in the walls or floors, or water-channels. An even temperature can best

Fig. 1.—INTERIOR OF SPRING-HOUSE, WITH ELEVATED TROUGH.

Fig. 2.—INTERIOR OF SPRING-HOUSE, WITH LOW TROUGH.

issues from springs, is constant, or nearly so. The temperature, too, is as nearly as possible that which causes the cream to rise most rapidly and most completely. This is a very important point in butter making, and the excellence of the quality depends upon this probably more than upon any one other circumstance connected with the operation. Besides evenness of temperature, pure air surrounding the milk and cream, is a necessary thing to secure. A stream of pure flowing water insures this in two ways. There is no better absorbent of disagreeable scents than pure water, and the odor of milk, fresh from the cow, is very disagreeable; if it is not got rid of, it remains in the butter and cheese, and may be readily detected in them. This animal odor, as it is called, is volatile, and is easily driven off as the milk cools, if there is a current of fresh air or pure water brought into contact with it. A current of spring water, flowing around the pans of milk, will carry off this odor completely, and in addition to its own absorbent property, it sets in motion, through its lower temperature, the air of the spring-house, and causes currents to pass continually in and out of the house, and over the milk. These currents of air are also full of moisture, and this moisture helps to absorb the odors. At the same time there is no evaporation from the milk or cream, and in a well constructed and well managed spring-house, we never find the cream become dry and leathery, as it may do in dry, airy cellars or milk-rooms. Then there is the perfect cleanliness, which may be secured, where there is an ample supply of pure water, that may be added to the credit of a good spring-house.

at least four feet under ground. The spring should be dug out and cleaned, and the sides evenly built up with rough stone-work. The top should be arched over, or shaded from the sun. A spout from the spring should carry the water into the house. If the spring is sufficiently high, it would be most convenient to have the water-trough in the house elevated upon a bench, as shown in fig. 1. There is then no necessity for stooping, to place the pans in the water, or to take them out. Where the spring is too low for this, the trough may

be secured by building of stone or brick, with walls 12 inches thick, double windows, and a ceiled roof. In such a house there will be no danger of freezing in the winter time. The drainage will be secured by choosing the site, so that there is ample fall for the waste water. The waste water should be discharged into a basin, from which a covered drain should be constructed. The character of the whole building is shown in fig. 3. The size will depend altogether upon the number of cows in the dairy. For a dairy of 20 cows there should be at least 100 square feet of water-surface in the troughs. The troughs should be made at least 18 inches in width, which would admit a pan that would hold 8 to 10 quarts at three inches in depth. A house, 24 feet long by 12 wide, would give 60 feet of trough, 18 inches wide, or 90 square feet. The furniture of the house should consist of a stone or cement bench, and an oak table in the center, upon which the cream-jars and butter-bowls may be kept. It is well to remember, that it is the universal experience of all dairymen, who have tested the matter, that cream or butter should never be placed upon the floor of a dairy. The impure air always descends to the

Fig. 3.—EXTERIOR OF SPRING-HOUSE.

be made on a level with the floor, as in fig. 2. The purity of the air is to be secured by removing all stagnant water or filth from around the spring, all decaying roots and muck that may have collected, should be removed, and the ground around the house be either paved roughly with stone or sodded. The openings which admit and discharge the water, should be large enough to allow a free current of air to pass in or out. These openings should

floor, and nothing is more easily injured in flavor by any impurity, than cream or butter. Two or three feet above the floor is the best place to keep either the cream or butter. For this reason we would rather have the water-trough in a spring-house raised at least 30 inches above the floor. In that case a grated opening should be made near the floor, for the purposes of ventilation. Where the deep-can system is used, a much smaller house will answer, with deep troughs.

The Pearly Everlasting.

There are many of our wild flowers which we admire as we see them in the woods and fields, but with which we do not think of associating the idea of cultivation. Yet many of our very common plants are prized abroad, and if one consults foreign garden books and catalogues, he will find both high praise and high

large corymb of flowers, or rather heads of flowers; for these heads, though not much larger than a pea, are made up of very minute florets, surrounded by many pearly-white scales, to which the beauty of the flower-heads is due. The engraving shows the summit of a stem, with the flower-heads of the natural size. In England this plant has been tried, among others, in bedding, on account of

some experiments in coloring it, after the European methods, and duly report the results.

The American Star-Thistle.

One of the showy plants of Arkansas, Texas, and other parts of the far West, is *Centaurea Americana*, the American Star-Thistle. It is

PEARLY EVERLASTING.—(*Antennaria margaritacea*.)

AMERICAN STAR-THISTLE.—(*Centaurea Americana*.)

prices given to things that he has known all his life after a fashion—but being wild flowers he has been on mere speaking terms, but has not, as it were, cultivated any friendship with them. Among the plants which are common, at least all through the Northern States, is the Pearly Everlasting—its botanical name is *Antennaria* for the genus—the derivation of this term is rather too obscure to describe here, but its full name is *A. margaritacea*, and nearly every one knows that this last means pearly.

The closely related "Life-Everlasting," or "Balsam," (the very strong and pleasant-smelling plant of which every good grandmother keeps a bunch in the garret to be handy "in case of sickness,") though it much resembles this, must not be confounded with it. That is botanically *Gnaphalium polycephalum*, and though a very good plant in its way, it is only an annual, and its less globular and more dingy heads, together with its strong odor, will at once distinguish it. Our pearly everlasting is a perennial, throwing up a number of stems a foot or two high from one root; these stems are very downy, indeed we may say woolly, and the numerous long, narrow leaves, are very woolly too, underneath, but green above; the stems branch very much at the top to form a

the light color of its stems and foliage, but there are many better plants for such uses than this. Our reason for calling attention to it is because its flowers have all the character of those known as "Everlasting flowers," and for persons who are fond of making up winter, or dried bouquets, wreaths, and the like, this is one of the very best things they can have. Indeed, wild though it is, it comes nearer the real "immortelle" of the French, than any of our cultivated flowers. We find that in the European catalogues of dried flowers, those of our native Pearly Everlasting are offered at a higher price than some of those we cultivate. It may be too late this year for those who wish to collect these flowers to find them—as we can not always time such things exactly right, but we are quite sure that lovers of everlasting flowers will be glad to have their attention called to this one. The flowers for drying should be collected before they have expanded too far; the flower-heads of some plants will show more of a yellowish center than those of others, and these should be avoided as far as possible. Of course only the most pearly should be chosen, and these, after tying in bunches, be dried away from dust and flies. To find out what our pearly everlasting is capable of, we shall try

an annual, growing two feet or more high, with a grooved stem; the upper leaves are entire, but the lower ones have broad teeth on the margins. The stem is branched above, each branch bearing a very large head of lilac-colored flowers, which is two or three inches across, and has much the appearance of an enormous thistle head. The outer flowers of the head are much larger than the others, and sterile, in which respect the genus differs from that to which our common thistles belong, as they have the flowers in the head all alike. The engraving gives a head of the natural size, and shows the greater size of the outer flowers. The bud or unopened head, given below the full one, shows a marked peculiarity of the plant; the scales to the involucre which surrounds the head, are most beautifully fringed upon the edges, with a row of straw-colored teeth or points. This showy plant has been in cultivation for the last half century, and though the seeds are kept by all the principal seedsmen, we see it in cultivation much more rarely now than we did a dozen or twenty years ago. It is a capital plant for producing a bold effect, especially if planted in a large clump, against a background of shrubs. It is usually sown like ordinary annuals in the open ground, but the

French gardeners think so much of the plant, that they sow the seeds early under glass, in order to get the flowers much sooner than they would if they sowed in the open border.

Using Concentrated Fertilizers in Gardening.

BY PETER HENDERSON.

Whatever kind of concentrated fertilizer may be used, I find it well repays the labor to prepare it in the following manner: to every bushel of fertilizer add three bushels of either leaf-mold (from the woods), well pulverized muck, sweepings from a paved street, or—in the absence of either of the above—common garden soil. In every case the material employed must be as dry as it is possible to procure it. When guano is used, be careful to have it thoroughly pulverized and broken up before mixing with the other ingredients. The fertilizer must be well mixed with the soil or mold used by turning it at least twice. This mixing should be done in winter, or early spring, and the material be packed away in barrels in a dry place for at least a month before using it. The main object of this operation is for the better separation and division of the fertilizer, so that when applied, it can be more regularly distributed over the land; besides this, no doubt the fertilizing qualities of the leaf-mold or other substance are developed by this treatment. Experiment has shown that this method of using concentrated fertilizers of nearly all kinds, materially increases their value. One of the most successful market gardeners in our neighborhood, has adopted this method for years, and in extensive experiments with different kinds of fertilizers, with and without being mixed, finds a saving of quite one-third in quantity in thus treating them. He finds that 1,200 lbs. of guano, mixed with two tons of garden soil, and sown over the surface after plowing, and then harrowed in, is equal to 2,000 lbs. of guano used without mixing.

We have ourselves experimented with guano, blood and bone, and bone flour, with nearly like results, and as a top dressing for grass, we think the advantage of mixing is even more marked. When fertilizers are applied to corn, potatoes, tomatoes, etc., in hills or drills, it is not only more economical to mix in this manner, but much safer in inexperienced hands; for when any strong fertilizer is used pure, injury is often done to the roots by their coming in contact with it in too great quantity in the raw state, owing to imperfect mixing in the hill or drill, while, if composted as advised above, the danger is much less. We are often asked as to the quantity to be applied to different garden crops. Taking guano as a basis, we would recommend for all vegetable crops, if earliness and good quality are desired, the use of not less than 1,200 lbs. per acre, mixed with two tons of either of the materials recommended. This quantity is used broadcast by sowing on the ground after plowing, and deeply and thoroughly harrowing in. When applied in hills or drills, from 100 to 300 lbs. should be used to the acre, according to the distance of these apart, mixing with soil, etc., as already directed.

In regard to which of the fertilizers is most desirable, we find but little difference, provided each is pure. Guano at \$80 per ton, is relatively as cheap as blood and bone fertilizer at \$65; bone flour at \$50, or superphosphate at \$40; for in the lower priced articles we find we are obliged to increase the quantity to obtain

the same results, so that the cost is nearly alike which ever be used. The all important point is the purity of the article, a matter that few working farmers or gardeners ever attempt to decide except by the results in culture, hence we advise each one who has been using a fertilizer that has proved satisfactory, to experiment lightly with another until the new article has proved its merits. The competition in the manufacture of articles so much in use as fertilizers, has in many instances forced down prices below the point at which they can be produced in a pure state, hence the wide spread adulteration with "salt cake," "plaster," and other articles utterly worthless but to make weight. Next in meanness to the quack that extracts money from a poor consumptive for his vile nostrums, is the man who compels the poor farmer or gardener, may be a thousand miles away struggling for an existence, to pay freight on the sand mixed with his guano, or the plaster in his bone dust. In this relation I am reminded of a retribution that fell on the "Sands of Life man," who figured so conspicuously a few years ago in New York. The advertisement of this philanthropic gentleman it will be remembered, was that "A retired clergyman whose Sands of Life had nearly run out," would for a consideration tell how the "running out" could be stopped in others. A kind hearted fellow in Illinois, deeply sympathizing with the old gentleman on account of his loss of "sand," sent him by express—but forgot to prepay—a thousand pounds of the article! It is reported that the "retired clergyman" on opening the box, expressed himself in a manner not only ungrateful, but utterly unclerical. We counsel no vengeance, but if some of these sand-mixing guano men could have the sand sifted out by their victims with compound interest added, and returned to them under the fostering care of an express company, it would be but even handed justice.

Notes from the Pines.

HERE IS TROUBLE! and I am the cause thereof. Moreover it is a lady who is in trouble, all through following my advice. Still I suppose this is what those who try to enlighten the world by appearing in print must expect. Every now and then I have received, through the courtesy of the editor, a letter of thanks, from some reader who has been helped by my "notes," but here is—well, if it were not from a lady, I should call it a "blowing up." It is, however, more in sorrow than in anger, and the case is not past remedy. The lady, who writes from Otsego Co., N. Y., says:

"I consider you the proper person upon whom to bestow my wrath, for did you not by your enticing representations, induce me to procure *Aquilegia carulea*, from the Rocky Mountains! the queen of the Columbines, verily the queen of all herbaceous plants! I received mine from—last fall, and early in the spring it was the first to show itself. Patiently and longingly I waited and watched its growth, as it developed its green bud, as it opened fully its green flower—as finally it changed its green for a dingy purple-pink. No spurs at all. People exclaimed, 'what a vile weed!' In mercy tell me is my plant the true *carulea*, or what is the matter? It is a dire disappointment to me."

If I were to recommend the little Brittany cow as a nice pet animal for a small family, and some one should order one and get a tall, lank, Texan instead, with horns so spreading that the barn-door must be widened, would it be right to blame me rather than the cattle dealer? The Rocky Mountain Columbine is all

right, my description of it was not over-drawn, and the only trouble seems to be with the dealer, who sent something else. Now if I am to be held responsible for the mistakes of seedsmen's and florist's clerks all over the country, I may as well give up horticulture, and not write another "note." The disappointment she expresses shows her to be a true lover of flowers, and if she will be patient for a while, I will try at the proper season to send her a plant of the true thing. . . . Some time ago I wrote that I was experimenting in

CARPETING BENEATH SHRUBS, with the double object of improving the appearance, and by occupying the soil, to avoid the necessity for weeding. There are several low greenhouse plants which will spread rapidly, and answer well for beds of greenhouse shrubs that are set out temporarily, but in the regular shrubbery we require something permanent. *Cerastium Biebersteinii* and *C. tomentosum* were not very successful, but they were planted where the shrubbery was the densest, and I have hopes of them if used where they can get more light. My most thorough success is with the moneywort, *Lysimachia nummularia*, the little trailer so much used for hanging baskets. Where this was set in sufficient quantities in the spring of last year, it now covers the soil with the densest possible mat of foliage; it covers so closely that not an inch of soil is to be seen, and no weed dares dispute possession. This answers the purpose so completely in one part of my shrubbery, that I shall extend it to others. There is as much difference between the appearance of a shrub-border with the earth so carpeted, and one with it bare, save for weeds, as there is between a carpeted and an uncarpeted room. I have also tried the so-called variegated moneywort, this is of a bright greenish yellow when grown under glass, but in the open ground it only shows its variegation in a dull sickly look, and the plant has nothing like the vigor of the ordinary kind. I am so much pleased with my experiments that I shall continue them with other plants, and report in due time. . . . There are some plants of no especial merit, that become very popular, and others which are really good, that fail of appreciation. In this latter class I regard

SEDUM SPECTABILE, which you figured when it came out, several years ago, as *S. Fabaria*, under which incorrect name it is still to be found in collections. It makes a dense clump of stems, some 16 or 18 inches high, each one of which produces a broad cluster of purplish-rosy flowers, and as their clusters are numerous and close together, they make a broad sheet of bloom over the whole top of the clump. One of its best qualities is the lateness of its flowering; it comes along in September, a time when flowers are none too numerous, especially those with delicate tints. I suppose the reason why this plant has not been better appreciated, is that its habit and foliage are much like those of the old *Orpine* or *Live-for-ever*, (*S. Telephium*) which has escaped from gardens, and has become a weed in many places. The showy sedum is propagated with the utmost ease by division of the clump, or by cuttings of the stems, and I know of nothing that is more pleasing in its season than a clump of this. . . . In our

FANCY BEDS, sometimes a plant will fail; I made a bed with *Colous Verschaffeltii*, *Achyranthes aureo-reticulata*, *A. Lindenii*, and *Gnaphalium lanatum variegatum*. For some reason the *Gnaphalium* did not grow well; it remained

stationary for weeks, until the other plants had quite outstripped it. As it was too late to get a bedding plant to replace the *Gnaphalium*, I remembered something I had seen in an European journal, so the *Gnaphalium* was pulled up, and its place filled by a row of tops cut from the *Sedum spectabile*; the flower clusters, still in very young bud, were cut with stems six or more inches long, and set out as if they were plants. They have gone on just as if they had not been separated from the parent plant, and are now in full bloom. . . . I wonder upon what principle the so-called

ORNAMENTAL GRASSES are selected. Seeing in the catalogue of a seedsman the names of several "ornamental" grasses, which I did not know, I procured a lot of seeds. The result is the greatest lot of trash I ever saw outside of a weed-heap. Some of the grasses, of which the seeds are offered for sale, are very pretty. The *Brizas*, *Stipa pennata*, *Brizopyrum siculum*, *Agrostis nebulosa*, and some others, are worth growing, but these "novelties" are enough to disgust any one with ornamental grasses. I could make a circuit of half a mile around the place, and load up a hay-rack with wild grasses more ornamental than any I have grown this year. . . . When I look out upon my bed of

PERENNIAL PHLOXES, I wish every reader could see them, and know how much brilliancy and beauty can be had at a very small expense. A few of the older kinds are common in gardens all over the country, where they are called French Lilac—probably for the sufficient reason that they are neither French nor lilacs. The garden varieties are from our native *Phlox paniculata* and *P. maculata*, which in their wild state vary so much, that the different forms have been described as distinct species. The European florists have by hybridizing, crossing, and selection, made wonderful improvements, and we now have them from the purest white to fine crimson, and often with two colors in the same flower, beautifully shaded, or in distinct markings; some are only 18 inches high, and others 4 feet or more. They are perfectly hardy, and require no care whatever—and with them the most magnificent display can be made. How the butterflies and the bees like them! In a warm day it is an interesting sight to watch the great number of butterflies that hover over them, as if by the brilliancy of their colors they had a right to claim companionship with the gay flowers of the phloxes. Fifty or more named varieties are offered by the florists—the newest always the dearest, and not always the best. . . . I have before mentioned my success with the true

HEATH, HEATHER, OR LING, *Erica (Calluna) vulgaris*.—(Now if any Scotchman is disposed to pick me up, and write a long letter, saying this plant is not the heath, I hope he will save himself the trouble, for I have been all through that discussion once.) Every European who comes to my place, is surprised and delighted to see large clumps of this plant; I have had it now these six years, and with its relative, *E. carnea*, it is hardy and satisfactory in all respects. The common form of the heath has behaved so well that I this spring sent to the celebrated Knap Hill Nursery, of Anthony Waterer, near Woking, Eng., for a set of all the varieties in cultivation. I received about a dozen, some remarkable for the beauty of their foliage, others for the size or color of their flowers, including a double one; these have stood the summer well, and have made a good growth. I shall protect them the first

winter, and if they fulfil their present promise, the bed will be a great satisfaction. . . . I last year learned a very useful wrinkle about

GLADIOLUSES which I have put into practice; however fine the flowers of a *Gladiolus* may be, the plant itself is not of elegant habit, and a bed of them is just a concentration of floral gawkiness. This year I set the *Gladiolus* bulbs among *Rhododendron* and other low growing shrubs. The spikes show brilliantly above the dark foliage of the *Rhododendron*, and the flag-like leaves are not noticeable.

Preserving Flowers—Winter Bouquets.

THIRD ARTICLE.

In the natural sequence of these articles, we should publish the methods of coloring the everlasting flowers, grasses, etc., but as the seeds we sowed with the view of obtaining flowers for this purpose, were put in late, we have not yet had sufficient material for experimenting. In all such matters we prefer to make a trial, before publishing the process, that we may see the difficulties which a novice will be likely to meet with. In the matter of coloring flowers and grasses, it is well to make one job of it, therefore the delay in publishing the method this month is of little consequence. The flowers and grasses should be collected as long as the season lasts, and dried in small bunches, as heretofore directed. Some of the most useful wild and cultivated grasses for bouquets will be found this month; they should be collected before they are so far advanced as to drop their seeds, or the parts of their flowers. Those collected while in blossom, will of course let fall their anthers, which is of no consequence. We have had some inquiries in regard to preserving ferns for decorative purposes, as well as to bleaching them. Some of the ferns are of exceedingly graceful outline, and are used in various ways; in making up flower-pictures, they are indispensable. They are sometimes grouped and placed between two panes of glass, to decorate the side-lights to a front or vestibule door. Some of the more delicate ones are used to place around the broad white margin of an engraving, and there are various ways in which they may be made useful. For all these purposes the ferns require to be simply dried between papers. As a general thing they contain but little moisture, and dry quickly; old newspapers will answer for drying, and there should be sufficient weight upon top, to keep them perfectly flat. When dry they must be kept under pressure, until wanted for use, otherwise they will curl out of shape. An old book, such as the bound volume of some newspaper, that is good for nothing else, may be used for pressing and preserving them in. Those who are fortunate enough to be able to procure the delicate and graceful Climbing Fern (*Lygodium*), will find it necessary to coil it carefully while pressing. As to bleaching ferns, they are to our notion more pleasing in their natural state; but they may be bleached, after they are dry, by the same solution used for bleaching grasses, which will be given later. Some fruits, or seed-vessels, are used in large winter-bouquets with good effect, and they are useful for decorating frames, small brackets, and other ornamental work; the seed-vessels of the sweet-gum tree, acorns with their cups, the pods of the bladder-tree, the keys of the ash, the winged fruit of the hop-tree, and numerous others that one will meet with in an autumn ramble, should be col-

lected, dried, and put away in a place free from dust and mice for future use.

Preparing Plants for Winter.

Those who have flowers in the open ground, which they wish to keep in the house during the winter, are very apt to delay taking them up until the first frosty nights show that they are in danger. For ourselves, we do not think it pays to take up geraniums and such soft-wooded things that are apt to grow out of shape during the summer, but we make cuttings and start with nice vigorous young plants, but those who have not made this provision, will take up the old plants. The first part of October is quite late enough to pot the plants that are intended for window culture. Any good garden soil will do for potting, and if it is likely to be too stiff and bake after watering, mix some sand with it; it is better to use liquid manure after the plant is well established, than to add manure to the soil. Use clean pots, and those without cracks, put crocks for drainage in the bottom, and then pot the plant, removing any straggling roots, and carefully press the soil firm around the plant. At the same time trim the plant into shape; do not be afraid to use the knife freely; the chances are that too much will be left rather than too much cut away. Shade for a few days, water as needed, and when the foliage shows that it has recovered from the shock of removal, more sun can be given. It is important to inure the plants to confinement gradually; set them on a veranda, or where they will be well exposed to the air and light, and yet be protected from frosts at night; if an unusually cold night occurs, take them in-doors. When finally taken in, place them in a room where the windows can be opened every pleasant day, and do not bring them where there is fire-heat, until the temperature makes it necessary. More house-plants are injured by too high a temperature, and too dry an atmosphere, than by cold. Preparations should be made for preserving half-hardy plants in a pit or in the cellar. If plants are to remain dormant until spring, several may be put into one box, with plenty of earth around the roots. See that the earth is not wet; plants when dormant are more likely to suffer from too much moisture, than from too little. They should be looked to now and then during the winter, and be watered if they absolutely need it. Geraniums cut back, winter well in the cellar, but if too much foliage and too many succulent stems are left on, they will decay. Those who have never tried it, will be surprised to find what a valuable adjunct a good dry cellar is to the garden in preserving tender plants.

THE EGYPTIAN BEET is among beets what the Trophy is among tomatoes. Last year the seed was scarce abroad, and some unprincipled dealers sent over a spurious article. This year we received seeds from both B. K. Bliss & Sons, and Peter Henderson & Co., of the real thing. These are so fine as early beets, and they are among the earliest, that we have kept up a succession of them. To have them in perfection they should grow rapidly, and be taken when about half grown. They then cook perfectly tender—in fact, are balls of crimson jelly—and whoever has not eaten them, dressed with a plenty of the sweetest butter, does not know of what a beet is capable. We always sow thickly, that there may be an abundance of the thinnings to cook as spinach.

A Fine Basket-Plant.—Tradescantia.

Hanging baskets, vases, window-boxes, and the like, are now among the most popular of household decorations, and the taste for these is likely to increase rather than to diminish. Almost any plant will grow in these, but those of a pendant or trailing habit are the most desirable, as in a basket, or other receptacle of this kind, the pleasing effect is much enhanced, if the plants hang gracefully over the sides. In most florists' catalogues we now find a distinct set of plants offered as "basket-plants"; these are generally of kinds which depend more upon the beauty of their foliage, than upon the abundance of their flowers. We have heretofore figured a number of these plants, and now give another, which is among the less common of these. We had the plant several years ago, but were glad to receive it again recently from Messrs. Long Brothers, of Buffalo, N. Y., who in their regular business as florists, make a specialty of hanging baskets. The plant in question is known in the catalogues of florists, both here and abroad, as *Tradescantia repens vittata*. It has much the habit of the well known *T. zebrina*, and *T. discolor*, also useful basket-plants, but as it has not yet flowered with us, we have not been able to satisfy ourselves as to the accuracy of the above name. The plant grows rapidly, and produces leaves that are strikingly marked with green and creamy white, in longitudinal stripes. The variegation presents the utmost diversity, and it is almost impossible to find two leaves marked precisely alike. The same plant will present leaves all green, some with a single line of white, and all white, with a single line of green, and between the two every imaginable diversity. Like the other Tradescantias, to which we have referred, this plant is especially adapted to house culture, as it will endure a dry atmosphere, and almost any amount of bad treatment, except freezing. Another peculiari-

ed in the soil, and it will grow as if nothing had happened. We have found that when grown in a cool atmosphere, the plant has a tendency to lose its variegation, but when this occurs, so readily is it propagated, that one

than an inch in diameter, are not certain to flower. The crown, or "pip," as florists sometimes call it, of the Lily of the Valley, when sufficiently developed to flower, should be of the size and shape shown in fig. 1. Those too

THE STRIPED TRADESCANTIA.

has only to start anew, by breaking off a branch with variegated leaves, and planting it. In filling a basket or vase, this Tradescantia will be found a very pleasing and useful plant.

Winter Forcing the Lily of the Valley.

BY PETER HENDERSON.

Within the past three years the demand for the flowers of Lily of the Valley has increased to such an extent, that though the importation of roots has probably trebled each year, the price of the flower is still quite as high as when the forcing first begun. The price last season, from December to May, averaged \$10 per 100 sprays at wholesale; a price which, when the bulk or weight of the flower is considered, is something wonderful, and probably higher in proportion to the bulk than that of any other flowers, unless it may be those of some species of Orchids. The high price of the flowers is due to the fact that the success of the crop is not always certain. The failures which attend it are mainly owing to the use of improperly developed roots. As with other similar plants, a certain size or development of the crown, or underground bud, is essential to produce the flower. What that size should be, is not, even with the most experienced, always easy to determine. In the Tuberose, the Japan and some other Lilies, we find that bulbs that are less

small to flower are like that shown in fig. 2. But these rules as to size and shape are not given as certain, for hardly any of us have had experience enough to say with accuracy at what size the crown of the Lily of the Valley, or the bulb of a Tuberose or Lily will not flower, although we may say with considerable certainty, if the crown is large, that it will do so. It is the want of this knowledge that, in my opinion, has made the forcing of the Lily of the Valley so uncertain; thousands of roots have been imported that have not given flowers sufficient to pay the first cost of the roots. The cost is about \$25 per 1000 for single crowns, and as each produces but one flower-cluster, it will be seen that nearly all should flower, to make the business of forcing fairly profitable, even at \$10 per 100. We last year imported what seemed a very fine lot, which, on coming into flower, showed that one-third were "blind," or flowerless. As in forcing the Hyacinth, and other similar bulbs, crowns of the Lily of the Valley should be covered up outside for a few weeks, before being brought into the greenhouse to force. Those we flowered last year were imported about the middle of November, and were then packed closely together in light, rich soil, in boxes three inches deep. These were covered up outside with hay until the first of January; they were then brought into a greenhouse, facing north, where there is no direct sunlight at that season. The temperature was kept at about 70°, with a moist atmosphere, and by the first of February they were in full flower. The Lily of the Valley could be grown finely in a Wardian case, as it would there get the proper light, with the necessary damp atmosphere. When grown in greenhouses, exposed to sunlight, it is necessary

Fig. 1.—FLOWERING CROWN.

ty, which adapts it for basket culture, is the great ease with which it may be propagated; a piece of any size may be broken off and insert-

Fig. 2.—CROWN TOO SMALL TO FLOWER.

to shade the glass very heavily. When the flowers are about to open, they should then have light to give the leaves a healthy green color.

THE HOUSEHOLD.

(For other Household Items, see "Basket" pages).

How to Use Corn Husks.

Large quantities of corn husks are wasted every year, which might be made useful in many ways. When simply stripped into shreds and dried, they make soft wholesome beds and excellent cushions. We have seen the husks shredded upon an old-fashioned hatchel, but it would be much better to arrange a single row of teeth or blades, in a heavy board or block for a base, so that the husks could be drawn across them in small handfuls, and slit

Fig. 1.—TABLE MAT.

into shreds from a quarter to half an inch in width. The farmer who uneasily changes his seat every moment as he rides to market, upon the rough board placed across his wagon, would find ease and comfort upon a bag filled with corn husk strippings. Many other uses may be found for husks, but one of the most important, is the manufacture of mats, both for the table and for the door. Very elegant table mats have been made from the finer husks, and if care is taken to select the softest and best colored husks, the mats will not disgrace the most carefully furnished table. Fig. 1 represents a mat made of husks, which has done service upon our

Fig. 2.—IN-DOOR MAT.

table for several years, and which is yet equal to new. It was made from the fine inner husks, which, when the corn is ripe, are of a delicate straw color. These are dampened with clean water, and plaited in a three cord plait made close, firm, and even. When one of the husks is nearly used up, the end of the other is placed beneath it, and the plaiting goes on; fresh ones are worked in, in this manner, as needed; the loose ends being always left projecting at the under side of the braid, to be cut off neatly afterwards. As the braid is plaited it is wound into a ball, until several yards are made. It is then trimmed of the loose ends, dampened again, and then sewed together by the edges with straw colored silk, into mats of any shape desired. If oval mats are to be made, the braid is to be folded side by side of such a length, as the length of the mat is to exceed its width. If the mat is to be round, or square, or six or eight sided, it is begun in the same shape, and

Fig. 3.—SLIPPER.

each round very carefully sewed to the one preceding it, in such a manner as to retain the shape. When it is finished it should be dampened once more and ironed with a hot flat-iron, and placed to dry beneath a folded sheet and a heavy weight. Very pretty mats are made by dyeing the husks of light neutral tints, such as drab, lilac, or French grey. The brighter colors of red, green, blue, or purple, are too glaring to look well upon a table,

Fig. 4.—BRAID.

and are not to be recommended. For heavier use the coarser husks may be selected, and very tasteful floor mats may be made of them. For these mats the brighter colors may be used with advantage, and a tasteful combination will have a good effect. Fig. 2 shows a mat of this character. At fig. 3 is seen another useful domestic article, a slipper, which is of far too infrequent use in farmer's houses. The braid is sewn together with double silk, or strong drab linen thread, and very serviceable, and even handsome slippers may be thus

made. Finally the kitchen door may be furnished with mats made of husks. For this rough use the thickest husks should be chosen, and they should be plaited together thickly, but tightly. The tighter and closer the braid, the more durable will be the mat. There are several kinds of kitchen mats that may be made. The plain braid may be sewn together with stout twine and a coarse needle, in the shape shown at fig. 2, or it may be made of any other desirable shape. Another method is to weave a double husk into the plait at each turn-over. These are put in as thickly as possible, as shown at fig. 4. When enough has been plaited, the braid is sewn together as before described, leaving the double husks which have been interwoven, projecting at the upper side, in the manner of a brush. These are clipped off evenly with a pair of shears, and the result is a mat like the one shown at fig. 5. This by no means exhausts the list or variety of mats. Ingenious boys and girls, may devise many other ways of using corn husks, and these will occur to them as soon as they commence to make one mat. For very rough use such as

Fig. 5.—OUT-DOOR MAT.

out door purposes, and for barns, husk mats may be made by taking the head of a flour barrel or board, and nailing two cleats across to keep them together firmly; then boring holes close together with an inch auger, and inserting into each hole a bunch of husks tightly rolled together. A wooden peg is driven into the centre of each bunch, at the under side of the mat to secure it firmly, and when every hole is filled, the top of the mat is clipped evenly. When a mat of this kind becomes worn, it is easily renewed by replacing the old and broken husks with new ones.

Home Topics.

BY FAITH ROCHESTER.

DOES SICKNESS PAY?—Any sane person would, of course, say "no." Then a large proportion of our neighbors must be insane, if we may judge by their actions; for they do the very things that induce disease day after day, and year after year, groaning over various aches and pains, giving a week or a month now and then to the tedious necessities of sickness, and paying heavy doctor's bills every year. All this, as a matter of course—is mainly the result of ignorance. I mean ignorance in respect to the bodies we inhabit, and the laws of our Maker with regard to their growth and health. Many persons, who are learned enough in ancient languages and in general information about all sorts of things outside themselves, have no sort of knowledge as to living so as to be comfortable from day to day, getting the best use of their powers, and escaping disease and premature decay and death. Whole families of "cultivated" people live daily in such a way as to ruin their health, and so destroy the power of using and enjoying the culture they have acquired. Then they employ a doctor to cure them, but go on tearing down what they are paying him heavily for trying to build up. Does it pay?

My late neighbor, for instance: she is a woman of uncommon ability as a housekeeper. She scorns the idea of stopping to rest, and is proud of her ability to do more and harder work than any of her neighbors. She ridicules those who refuse to eat anything that tastes good, for the reason that it is injurious to their health. Nothing ever hurts her, according to her own story. But this woman has severe fits of sickness every year, and the list of her ailments is truly astonishing. Last year she paid over one hundred dollars to her doctors—money that she worked hard to earn when well enough to do so. Last month she still laughed at the idea of taking care of her health, but she was then under the doctor's care, and was sending away to procure expensive medicines.

It was a little five-year-old girl who set me upon

this train of thought to-day. She said of a former playmate:

"Huldah used to be always eating candy or sugar and bread. How much candy she used to eat!"

"And she is a poor sick child," I answered.

"Yes, she always had the tooth-ache, or the stomach-ache, or something."

We all remembered how much and how helplessly she used to cry sometimes, how pale she usually looked, how small she remained, while some of her playmates, more wisely fed and clothed and lodged, went on out-growing her. Little five-year-old declared she thought it didn't pay to eat candy, which only tasted good in the mouth for a few minutes, and then suffer so much to pay for it. Yet she is not such an unchildish child as to refuse the next stick of candy offered her. However, she will bring it to mamma, if she does as always heretofore, and accept it in half-inch lengths at her meals, dividing with others when it is dealt out to her. And, though you may laugh, I really believe that a child fed so moderately upon such concentrated sweets, gets more enjoyment out of them than one who eats twenty times as much in quantity.

It pays a good deal better to take a little rest, and to try a little fasting perhaps, when the body begins to complain of weariness and discomfort, (did you ever notice that the word disease is simply dis-ease, or *not-ease*?), than to stagger on with foolish bravado, and have to lie by in pain and weakness for weeks and months when these follies have piled up high enough to bring about the crash. It pays in dollars and cents to avoid doctor's bills by avoiding sickness. Our little family can not boast of robust constitutions, or of the most healthy habits in all respects—if we should wish to do such foolish boasting—but we do often rejoice that we are able to escape severe illnesses and that we have found no necessity for a doctor's care or doctor's bills for several years past, and that no medicines, beyond ease in the adjustment of our diet, exercise, rest, clothing, and cleanliness, ever seem needed or get used by us. Some sickness we must expect until sanitary conditions are allowed to each—until we are all wise enough to see the inter-dependence of each and all. Then we can work together and clear up this present "vale of tears," so that it may be a very pleasant and comfortable home for us while we wear our robes of flesh—and for such glorious consumption I hope I work no less cheerfully because "it may be," as you say, "millions and millions of years hence."

POTATO DIET.—Not long ago I remarked in the course of conversation with a lady that my children ate a good deal of bread and milk. "My Willie seldom eats it," she said. "He seems to need something more nourishing—eats a good deal of potato." Here our conversation was interrupted. If Willie eats milk, or eggs, or lean meat, with his potato, very well. But if he is kept upon potato and butter, or fat gravy, with white bread and butter, and cake and pastry at meals when potato is absent, he is very poorly nourished in my opinion. He may look fat, as children do when food is mainly of the fattening or heat-producing kind; but he will be likely to lack in bone and muscle. Potatoes alone cannot supply the system with enough of the mineral elements required for a healthy growth. So says Dr. Edward Smith, the author of an excellent book on "Foods." This book agrees in the main with one to which I have before referred, "The Philosophy of Eating," though less given to theorizing and more to the simple description of various kinds of food. In the Philosophy of Eating we are taught that potatoes are finely adapted to be eaten with lean meat—the starchy potatoes furnishing the fattening and heating elements which lean meat lacks, while the lean meat supplies the bone and muscle-making elements not afforded by potato or fine flour bread. Fat meat affords heating and fattening elements, like potato, but in a form less easily digested by most persons.

FAT CHILDREN AND CONDENSED MILK.—I have seen condensed milk recommended for infants deprived of their mother's milk, but the author of "Foods," says that it should never be used as a

substitute for new milk, whenever that can be obtained. He quotes another authority which states that such milk caused an undue development of fat, leads infants to refuse food of more simple flavor, and renders them less able to resist disease. Children like the condensed milk, on account of its sweetness. In the process of condensing the milk, good granulated sugar is added in the proportion of a pound and a quarter to each gallon of milk. The writer says "I have observed in a number of cases, carefully watched during the past eighteen months, that while condensed milk fattens, and while children apparently thrive upon it, the vitality of the child is below par to a very dangerous degree. Indeed so far as my experience goes, it has been invariably the case, that children fed on condensed milk, and are attacked with diarrhea at all severely, almost immediately got into a semi-collapsed state, and if brandy be not at once given, they die. I have observed the same with other diseases, as for instance measles, whooping cough, and bronchitis. The resisting power of the child has been bad, and those children brought up on the impure London fed cows' milk, will resist an attack of acute disease, better than children fed on condensed milk."

It is a very common error to suppose that fat is a sign of health, yet we all know that fat people are not in near so good condition for active usefulness, as are persons who have only a moderate amount of flesh. Children who have fat bodies and ruddy countenances, are sometimes badly diseased with decaying teeth, frequently have worms, and great tendency to croup and diphtheria.

HOW GOVERN THE BABY?—The questions of an old play-mate of mine, which came to me yesterday in a letter, is much like questions other mothers sometimes ask me. She says: "I do so wish I could see you with your little flock, and see how you manage with them, and with house-work, and sewing, and reading, and writing day after day, week in and week out. Wonder if you ever get nervous or worried, or in other words, lose patience, and feel like shaking the children. Or do you take to it kindly, and by natural or acquired grace, bear with all their whims, and teasing, and naughtiness, without feeling like slapping them. O! I wish I *did* know how you manage them! For instance, when they are about two years old, like G—, and you tell them not to go outside the gate, and they know all that you mean, but every chance they get run off, what do you do with them? Do you ever whip? It is my belief that a child can not be made to mind without feeling a hurt. But I have some friends, in whom I feel great confidence, who never inflict punishment for disobedience, and who think it a great shame to whip a child, and who insist that children shall be governed by love. But the truth is, the child of those parents, I have in mind, does not behave half so well as G—. Now I am sure I do not know what is the right way, and I wish I *did*. I would like to see my boy mind the first time he is spoken to, and I always wondered to hear people tell a child half a dozen times to do a certain thing, but baby hardly ever minds the first time we speak to him. I don't want to go around with a whip in my hand all of the time, and if you, with longer experience, have learned the way, I would like to be led."

I can not say that I have learned "the way" to make children of any age mind always, the first time they are spoken to. I have daily trials in that respect, and I suspect that it is because my children have so little fear of me. I do suppose that the frequent use of a whip or stick might make "better-behaved" children, than any who live at our house, but whenever I think over the matter, (and that is daily, or rather nightly,) I feel sure that a whip for family use would cost more than it would come to, and my prayer is still for more patience. I can see that the delay of the little ones is not real disobedience—that is, it is not intentional. They are "just going" to do what they are told, but their own business seems very important to them. I hate to speak sternly, or in a tone of command, but fretful entreaty is no better. A pleasant suggestion ought to suffice for children, who stand to

us in the relation of little friends. In all small matters of a personal nature, I think it pays well to say "please" and "thank you" to a child, and I have always habitually and rather unconsciously done this. "Please shut the door, dear," "Please hand me my thimble," and then "thank you" for the favor; for it does seem too bad, to call children from their play, to just wait upon us, and we must remember that our example is likely to be followed in their intercourse with each other.

Such a case, as my friend mentions, is different. I have had little trouble with runaways, but I think I should tie up the little truant feet every time they transgress prescribed bounds, until they learn to obey. Five minutes is "an age" for such a punishment to a small child. The object is to impress the mind, so that the little one will not forget to mind, or so that it will see that disobedience does not pay. It ought to be done good-naturedly, with tender pity expressed for the naughty little feet. Yesterday I tied up a pair of hands for striking brother. I hugged the little sinner, while I tied them up, and talked as though the owner of the hands of course wished to correct such a naughty habit, or to refrain from establishing such a habit; and she evidently rather took my side as against the hands. They were to stay tied together, until the clock struck, or about five minutes. When I untied them, I kissed each one, because I "was sure they would try to behave better now."

O dear! It takes line upon line, and precept upon precept, and I often feel discouraged—chiefly on account of my own mistakes, which almost all arise from a deficiency of patience. We are not good enough to carry out our own theories. Our little ones are chips of the old blocks, and inherit from us and from the sources whence we derived our tempers and temperaments, many of the evils which we deplore in them.

It may be best to "rule by love" alone, never appealing to a child's fears, but most of us feel that we have not time. We have to deal with our culprits too hastily. When two get into a quarrel, it seems impossible to do exact justice, because we have not time and are pressed with other cares. I can see clearly that it is best to take time, and that we ought to remember, that no other duties can exceed in importance, the moral culture of our children, but when it comes to the actual case, alas!

There is an excellent book, by Jacob Abbott, the author of the Rollo Books, called "Gentle Measures in the Treatment of the Young." I like this book better than the "Mother at Home," written by another Abbott. It is probably what most inquiring mothers are in search of, and it is more easy of comprehension, and what most persons would consider more practical than Mrs. Mann's, or Spencer's, or H. H.'s writings upon the same subject.

pudding—Sponge Cake—Catsup.

In July we gave some of the replies to the lady, who wished recipes for the above-named articles. We now add others:

PUDDING.—A Farmer's Wife, Masonville, N. Y., sends: Two eggs; one cup of sweet milk; one pint of flour; two tea-spoonfuls of cream-of-tartar; one do. of soda; two table-spoonfuls of butter; one of sugar. This is to be steamed from 20 to 25 minutes. My husband prefers sweetened cream on this kind of pudding, but maple-syrup is excellent.

For the benefit of those who have no steamer, I will tell how I make one: into a common dish-kettle place a small basin, turned upside down, put in water enough to about cover it, than set the dish that contains your pudding on that, and cover the kettle tight; if the water should happen to boil out, before the pudding is done, have some boiling water in the tea-kettle, which you may pour quickly and carefully down the side of the kettle, and all will be well.

PUDDING.—Aunt Esther, Windham Co., Ct., writes, that she sends directions for making one, that suits her George to a "T." To one quart of sifted flour add a measure each of acid and soda, of Horsford's bread preparation; mix it thorough-

ly with the flour, then wet it with cold, sweet milk, to which a tea-spoonful of salt has been added. Use milk enough to have the batter only just a little stiffer than that for wheat griddle-cakes; some flour requires more wetting than other. In the time of berries, add a cup of ripe berries, or cherries, or currants. In the winter a cupful of dried berries will do nicely, if they are moistened with a little water half an hour before using, and then rolled in flour, before putting into the pudding; dried currants are nice to put in at any time of year. Avoid much stirring, using only enough to mix the ingredients together, and cook immediately. You can put it into a covered pail, and place it in a kettle of boiling water, or in a basin in a steamer; cook it over boiling water; but I find so good market for it, that I cook mine in a four-quart pan, set over a kettle with boiling water. The water being boiling hot, when the pan is put over it, it must be kept so until the pudding is done. The time required to cook it depends on the quantity of flour used. For one quart of flour, one hour; for two quarts, two hours. The shape of the dish it is cooked in, makes some difference; it is better to cook a little too long, than not long enough. The pudding must be kept closely covered until time to take it off. For sauce, good thick sweet cream, and white sugar. This pudding is very easily and quickly made, and, if properly steamed or boiled, is very light and nice.

SPONGE CAKE.—Two cupfuls of sugar; four eggs; one-half cupful of water; two cupfuls of flour; one tea-spoonful cream-of-tartar; one-half do. of soda. Beat the sugar and yolks and half the water, until very light, then add the remainder of water, flour, and soda, etc.; when well beaten, add the whites of the eggs, and put immediately into the oven; bake one hour in not too hot an oven.

CATSUP that will keep one or five years, if it is not eaten before that time. Take of perfectly ripe tomatoes one-half bushel; wash them clean and break them to pieces, put over the fire and let them come to a boil, and then remove from the fire; when cool enough, rub them through a wire sieve; and to what goes through, add salt; two tea-cupfuls ground allspice and cloves, of each one tea-cupful; best vinegar one quart. Put over the fire again, and cook one hour, stirring with great care to avoid burning. Bottle and seal for use.

CATSUP, by "Mrs. D. B.," Long Island. Take a basket of tomatoes and pour boiling-hot water over them, so that the skins will come off easily, cut them up in a tin boiler, and cook them until they are soft enough to press through a coarse sieve, then put that which passes through the sieve, into the boiler again, and add four table-spoonfuls each of mustard, allspice, and cloves; two do. of black pepper, and one do. of red; two tea-cupfuls of salt; and three pints of vinegar. Cook over a slow fire until thick enough. I cannot state the time, as some tomatoes cook thick faster than others. I have just opened a bottle that is two years old in September, and just as good as when first made.

Cream Cakes.—Every one who has been in New England cities knows the Boston Cream Cakes. "Rel" sends the following recipes for making them:

CREAM CAKES.—One pint of water, one cup and a half of butter, four cups of sifted flour, eight eggs. Boil the water and butter. Stir in the flour slowly while boiling. Boil one minute, and when the dough is cool, add the eggs, which have previously been well beaten. Drop in shapely table-spoonfuls upon a buttered tin; bake in a quick oven.

CREAM FOR FILLING.—One cup of flour, two cups of sugar, one quart of milk, four eggs. Heat the milk, and when scalding hot, add the eggs, sugar, and flour, well beaten together, stirring as the mixture is slowly poured in. Flavor to suit yourself when the custard is cool. Make an opening in one side of each cake, and put in the cream with a spoon, taking care to put in enough. Be sure that the cakes are thoroughly baked, yet not scorched. This will make about fifty cakes. A quarter of the recipe given makes ten or a dozen cakes.

BOYS & GIRLS' COLUMNS.

The Doctor's Talks—The Garden and Seeds.

Some time last Spring I had something to say about your little gardens, I recollect that it was at the time of seed sowing, and I then expected to say more as the season ran along. Here it is now the time when most plants are ripening their seeds, and I find that I have said but little about the garden during the summer. Of course you have all had gardens of some kind, even if only a plant or two, or at any rate you have watched the plants in mother's garden, which is almost as well as having one yourself. Well, there have been the flowers,

Fig. 1.—FOLDING THE BAG.

growing and blooming all summer. Everybody has said "how beautiful," and "how sweet."—Now what do you suppose the flowers have been at work about, and what have they made all this brightness and sweetness for? Perhaps you think that the flowers have all these months been huddling and blooming, spreading their beautifully colored petals, and sending out their charming odors, just to please you and others. No doubt that when you collected a little nosegay of the best and sweetest, and carried it to mother or sister, you thought that these plants grew only for your enjoyment and their's. If the plants could speak, they would tell a very different story; they would tell you that all along they have thought but little of you and your pleasure, indeed, that they thought but little about the present time, for they were too busy in caring for the future—for next year, and the years to come, and that so far as you have cut away the flowers, you have only been a trouble to them; that their whole time and care has been given to the ripening of those little dark colored seeds, which are to make plants another year, and if they did put on fine colors, and keep honey and sweet odors down in their little hearts, it was only to tell their friends the insects, that they had lots to do in the seed-making way, and that they wanted the help of the butterflies, the moths, the bees, and all sorts of winged insects. How the insects can help the flowers, is a long story, which can not be given here, but may be told another time, still the fact is well known, that many of the plants in the flower and vegetable garden, would not get along nearly so well in the seed business, without insect aid as they do with it. Yes, all this growth of stem and leaf, all this display of bud and flower, all the bright colors, and honey drops, and sweet odors have been to produce just such little dry dark-colored seeds as were planted last spring. Seed, plant, flower, then seed again, is the way with most plants, over and over, year after year. Do you recollect that last spring I asked you to

Fig. 2.—FOLDING THE ENDS.

think what a wonderful thing a seed is; what a mystery is wrapped up in the tiny grain, which will remain quiet for years, until the proper heat and moisture awaken the sleeping little plant within it? But now it is not the proper time to talk about growing the plant from the seed, we must consider the seed as the end of the season's work of the plant. If we left the seeds to take their own course, they would be scattered upon the ground near where the plant grew, or they would be carried to greater distances as they were taken by the winds, or thrown by the bursting of the seed pods. The ways provided for the scattering of the seed, are many and most interesting, but we do not wish to talk just now about seed scattering but of seed saving. If we allow seeds to go just as they please, those of plants from warm countries will be killed by the cold of winter; others will come up after laying on the ground until spring, but at the same time the seeds of weeds will come up too, and our flowering plants will be likely, while very young, to be crowded and killed by the more rough and strong young weeds. So in gardening we help nature, by gathering the seeds and keeping them until next spring, or the proper time, and then sow them where we can take care of the little plants, and give them the ground all to themselves, where they will not have to struggle and crowd against any others. If you look around among the plants, you will see that the seeds are in little cases or

Pods of very different forms. Some of these pods go open with a pop! and scatter the seeds all about; these you must gather just as they begin to ripen; others just break open, and need a little shaking or rubbing, to make the seeds come out, and there will be still other kinds of seed-vessels. So you must exercise a little care in the matter. The best way is to have some paper-boxes, and put the seed-pods in these for a few days, until they dry; then rub the seeds out, pick out the remains of the pods, stems, and other coarse things, and then put the seeds on a paper, and carefully blow away the light dust that is among them. Mind, that when you gather the seeds, you put their name with them; write this on a piece of card, or on a bit of stick, to keep with the seeds while they are drying. Never have seeds of any kind anywhere, unless there is a name with them; this will avoid much trouble and guessing. Having the seeds all dried and cleaned, they are to be put away for winter; some make little paper-bags, by pasting them just like the grocer's bags, only much smaller, and these are very good. But I want to tell you how to make a bag without any paste, which can be larger or smaller, as you have few or many seeds, and which can be made anywhere in a "giffy;" if you are in a garden and wish to give a friend a few seeds, or if you are in the fields or woods, and find a plant the seeds of which you would like to save, if you have only a bit of paper, you can make a bag as good as the best.

How to make it.—You need a piece of paper, letter paper or smooth brown paper are as good as any, somewhat longer than wide; this you fold over, but not quite equally. See figure 1, the edge of the part of the paper you fold over, should come to the line between A and B in the figure. Then fold A over on to B, and both together over to the dotted line below B. This is twice as easy as it seems in explaining it. Then turn the paper over, and fold one end as shown at the right hand of

Fig. 3.—THE BAG COMPLETE.

fig. 2. Next fold the point b over in the same manner, and tuck the point b under the fold a, and it will appear as seen on the left-hand end of the diagram. You can prepare your bags by folding one end beforehand; when ready to put in the seeds, you can open the bag by blowing at the unfolded end, and when the seeds are in, that end is closed, by folding it just as you did the first end. This makes a bag, from which the finest seeds will not escape, and which for all but very large parcels, such as vegetable seeds, is as handy as need be. There is no paste required, no string to tie, and a very neat parcel can be made with common paper. But before you put the parcel away, do not forget to label it. Figure 3 shows how this is done. Like all such things, these bags are much easier to make, than to describe, but if you take a piece of paper, and follow the directions, I think you will succeed the first time. Seeds should not be put away until dry, and then they should be kept in a cool, dry place, where mice will not find them. I can not end this seed story, without asking you to put away many more seeds than you will be likely to want for yourself. Always have enough to give away, for you do not know how much pleasure may be inclosed in the little packet with the seeds. To care for and give away flower seeds, is one of the ways in which even boys and girls can help to make the world better.

THE DOCTOR.

Aunt Sue's Puzzle-Box.

DOUBLE ACROSTIC.

The initials and finals give the names of two rivers.

- 1. An island in Africa.
2. An exclamation.
3. A heverage.
4. A bird.
5. A girl's name.
6. To deplore.
7. A precious stone.
8. A river in Kansas.
9. A girl's name.
10. An exclamation.

HERBER J. K.

NUMERICAL ENIGMA.

I am composed of 13 letters:
My 3, 11, 13, is a city in France.
My 4, 10, is to perform.
My 12, 2, is to perform.
My 8, 1, 5, 9, 11, is a coat.
My 13, 7, 8, 11, is a city in France.
My whole is to be found between two continents.

GEO. H. FULLER.

METAGRAM.

In the name of a certain animal may be found: 1. Two large bodies of water; 2. Two very important pronouns; 2. Part of the face; 4. A measure; 5. A Hebrew measure; 6. A disgusting insect; 7. A country; 8. Invalid; 9. An eminence; 10. A musical note; 11. An unpleasant sensation; 12. Ice; and 13. A preposition. M. P.

PL.

Het hapt hatt daies of ourten oto entof sapes hoghurt eth wornar fedlies fo mansense, chivh a nam fo deeltax tisrip actonn ostop of trade.

CROSS-WORD.

My first is in Fannie hut not in Will,
My next is in quart, but not in gill,
My third is in short but not in long,
My fourth is in smile hut not in song,
My fifth is in rind but not in peel,
My sixth is in iron hut not in steel,
My seventh is in grandeur hut not in station,
My whole is a virtuous occupation.

ARTHUR AND RANNIE.

CONCEALED CAPES.

- 1. I can never be sufficiently grateful to that man.
2. It was a horribly dismal morning.
3. The sign was over a cellar door.
4. Is the Roc a fabulous bird?
5. Do it better? O! Ma, I never can.
6. Here, Ma, you do it for me.
7. Otto rang over so many times before the door was opened.

T. SCHWARMAN.

TRANSPOSITIONS.

- 1. One who in danger's always found
Becomes a tiller of the ground.
2. A female name, by sudden change,
Brings forth a fruit to us quite strange.
3. One who is made by debt a slave,
Becomes a dish I do not crave.
4. Transform one skilled in sacred lore,
Into a dweller by the shore.
5. A place where fire is used to burn,
Becomes a torch by skillful turn.

ENRICO.

CHARADE.

Two plants—the first one very bitter,
The other often known as "sweet,"
Will form a coin whose golden glitter
The eyes of Eastern travellers meet. HENRY.

DIAMOND PUZZLE.

The center letters, perpendicular and horizontal, form a well-known city.

- 1. Part of a cage.
2. A pronoun.
3. Malice.
4. A city.
5. Income.
6. The latter part of life.
7. Part of a book.

C. E. A.

WORD SQUARE.

- 1. A flag by several countries used,
'Tis not with flag of truce confused.
2. A kind of juice, unpleasant taste,
That's rather thick—a kind of paste.
3. By Indians used as food; by them
Long raised, from grain to glossy stem.
4. A game that men of pleasure play,
When into gilded dens they stray.

Aunt Sue's Chats.

BESSIE BENNETT wants to know "when capital p's and m's, should be used in writing 'mamma' and 'papa.'"—Capital letters when you use their names as proper nouns;—small letters when you write them as common nouns. Thus: "I am going out with Father," or "I am going out with my father."—She also says "won't you please explain how the Alphabetical Arithmetic puzzles are done?"—Won't some of you clever arithmeticians tell me how to "explain" it to her? Bessie has a few words to say on the fish question too.—"Perhaps the reason your niece Lottie's fish died, was because of the salt in the bread she gave them, for some say that salt kills them, (are you not thinking of birds, Bessie?) We used to have an aquarium; it was tolerably large, and we got some pretty small stones to cover the bottom, and several large ones with holes in them for a pyramid in the centre. The fish seemed to play 'hide and seek' among the stones. The aquarium was stocked with gold fish from Cincinnati, (Bessie writes from Clark Co., Ohio) and quite a number of common fresh water fish of different kinds from a creek. We had one fish, a pike, whose head looked like an alligator's; he ate smaller fish up, or at least they disappeared and we suspected him of eating them. We fed them with worms, macaroni, and occasionally little pellets of flour and water," and here Bessie's history ends. What became of the aquarium or of the voracious pike, she doesn't say. I wonder if I couldn't finish the story thus: "the pike died after all the rest of the fish disappeared; we had ceased to take

any interest in the aquarium; it stood around empty for some time, and now I believe it is in the barn somewhere, with one of its sides broken." How nearly am I right, Bessie?

A. D. (Annie Dominy?) wants to know if I ever saw the characteristics for a woman alphabetically arranged, and if I will please write them out for her. Yes, dear, here they are: Amiable, Benevolent, Charitable, Domestic, Economical, Forgiving, Generous, Honest, Industrious, Judicious, Kind, Loving, Modest, Neat, Orderly, Pleasant, Quiet, Reliable, Sincere, Tender, Useful, Virtuous, Wise, Exemplary, Yielding, Zealous. I quote from memory, and may not have them in the original form, but perhaps they are near enough for your use.

Thanks for puzzles, letters, etc., to Alf., Robt. W. Moor, Italian Boy, Capt. John W. W., and X. Answers should always accompany the puzzles sent.

Cruelty to Animals.

There are cases in which we must kill animals to keep them from hurting us, or because we need to use their flesh or skins. Also it is right that we deprive other animals of their liberty, and make them work for us. All these things can be done without cruelty; if we must kill, it can be done quickly and without much pain, and if we make them work for us, we can treat them so kindly, that they will love us and look upon us as their friends. No right thinking, really good person, will ever needlessly pain an animal. There are many, we are sorry to say, who will needlessly beat, brutally kick, and otherwise hurt a helpless animal. Think of a man kicking a gentle, useful cow! Let us hope that such people are not as cruel as they seem, and that they do not know or think how wrong it is. Young people are sometimes cruel as well as old ones. We do not like to think of a boy or girl as cruel, and had much rather hope that in

their desire for sport, they forget that they are giving pain to a poor helpless creature. What made us think of this was the picture given above. It is a very good picture so far as the art goes, but in the story it tells, it is a sad one. Some youngsters have been ill-treating a kitten; some tin vessel was tied to the poor creature's tail, and the frightened thing stoned and worried to death. The old lady came too late, the poor kitten is past saving; one guilty fellow has run away, and the other, all the while he is hiding a stone behind him, tries to make grandmother believe that it was not himself, but that other boy. No wonder he is ashamed, and now that the excitement of the hunt is over, he does not like to own that he has had a hand in such meanness, and coward-like, wishes to put all the blame upon some one else. You know that cruelty is not confined to young persons, but there is so much of it among men, old enough to know better, that there are now in most cities and towns, societies for preventing cruelty to animals, and laws have been passed which make unnecessary cruelty punishable by fine and imprisonment. If a man drives a horse which is too lame to travel, or if he beats his horse cruelly, he can be sent to jail where he can think over the matter. These societies do not often exist in the country, but there is need of them there. Let us have some. Let the boys and girls in each neighborhood, or each family, be a society to prevent cruelty to animals. If the other boys and girls do not agree in this, then be yourself a society of one. It is not the constitution, the by-laws, and the officers of a society, which make it useful, but it is the spirit with which its members work, and if one of you youngsters—a society of one—by quietly taking the part of those who can not speak, can prevent a horse from being beaten, or a kitten from the fate of the unfortunate in the picture, you will do quite as much good in your own little circle as if you had all the machinery of a society to help you. Here is prosperity to the noble societies of one!

Life Insurance.

Among the many useful applications of life insurance, not the least is that by which it may be made to enhance the financial credit and business prospects of individuals and associations. A young merchant or manufacturer of good standing, reliable character, industrious and energetic, makes application to a moneyed institution for a loan, wherewith to enlarge his business, or to a wholesale dealer for increased credit line for the same purpose. In either case, with the aid of good backing, sufficient endorsements on his paper, he will no doubt be cheerfully accommodated. Or it is possible that, on his own honest face and good reputation, both banker and merchant would gladly aid him. Both would feel perfectly well satisfied that nothing but death could possibly intervene, to prevent him from fulfilling to the utmost any contract in which he might engage. They know that his business is prudently managed; that he is energetic and industrious; that his record in the past is sufficient guarantee for the performance of all promises he may make for the future. But has either the banker or the merchant, in giving this credit, discounted the possibility of the death of the debtor? This is something that ought to be, if it is not, taken into consideration. In the happening of such an event, who will repay the money loaned; or take up the paper given for the wares purchased on time? Should death happen at a critical period, on the eve of the performance of an important business operation, who, then, could carry on the negotiations to a successful issue? In less familiar and less competent hands than those of the deceased, it would be impossible to carry on the business with any great prospects of success. In fact, experience has taught us that almost all experiments of this kind prove failures. Creditors would promptly bring in their bills; the executors, finding these claims pressing on them, would order a sacrificial sale of the assets, and the property would be sacrificed in order to realize ready money. Outstanding accounts in favor of deceased persons are notoriously slow of collection, and this would naturally do much to increasing the embarrassment. In this way many a prosperous undertaking is brought to grief; the capital invested is sunk beyond recovery, and the creditors, disappointed at receiving only a moderate percentage of their claims, indulge in a few anathemas and resolve to do no more business "on space" hereafter, unless on the basis of good security.

A policy of life insurance in a good company, furnishes complete protection against this loss, disaster, and ruin. Such a Company is the United States Life Insurance Co., of this city.

Devoe's Brilliant Oil.

Insure your life and your property against accident, by using Devoe's Brilliant Oil. No accident is possible in its use. Recommended by The Fire Insurance Co's., and Fire Commissioners.

Waltham Watches.

These celebrated Watches have been greatly improved during the present year, and several new sizes added to the list. The stem-winding and setting attachment can now be had with any grade or size, and all the old established grades of key-winders are also made as before. Any one who contemplates buying a watch, either now or in the future, should send for our new Descriptive Price List, which is now ready **AND SENT FREE.** This describes all the Watches, large and small, Ladies' and Gentlemen's, Gold and Silver, with prices of each, and contains besides information in relation to watches useful to every one. It also explains in full our plan of sending single Waltham Watches at low prices to any place in the Union by mail or express, with the bill to collect on delivery—with privilege to the purchaser to open the package and examine the watch before paying, and with no obligation to take it unless entirely satisfactory. Thousands have obtained genuine Waltham Watches from us in this way, and all have received full value for their money. A large assortment of extra heavy cases for the Pacific trade always on hand. Every one should send for a Price List, as the farther you live from New York the more advantage it is to deal with us. When you write please mention that advertisement was seen in the *American Agriculturist*. Address **HOWARD & CO., No. 222 Fifth Avenue, New York.**

Rifles, Shot Guns, Revolvers, Pistols, Ammunition, Fishing Tackle, etc. For Price-list, see page 157, April No. *Am. Agriculturist*, or address, with stamp, **GREAT WESTERN GUN WORKS, 285 Liberty St., Pittsburgh, Pa.**

(CIRCULAR.)

Consumers' Importing Tea Co., No. 8 Church Street, P. O. Box 5,509. New York City.

This is a combination of capitalists to supply the consumers of Teas throughout the United States on the mutual principle.

We have experienced agents in all the best districts of China and Japan to select Teas especially for our trade.

We expect every consumer of Teas to render us all the assistance they can in carrying out our enterprise, as we make a specialty of **SUPPLYING CONSUMERS ONLY** (and allow no middlemen to make any profit on our importations), which will enable us to supply them with Teas at prices lower than have ever been known, and of those fine qualities that seldom reach the interior, being sold only in the large cities and among the very wealthy.

Hoping the consumer will take an interest in our enterprise, and send at once for a circular with full explanations of how to proceed to obtain our goods, we remain,

Most respectfully yours,

Consumers' Importing Tea Co., No. 8 Church Street, P. O. Box 5,509. New York City.

Entered, according to Act of Congress, in January, 1874, by the Consumers' Importing Tea Co., in the Office of the Librarian of Congress, Washington, D. C.

THE PATENT ARION

PIANO-FORTE

Excels all others in Tone and Durability, and in Elegance of Finish they are unsurpassed.

These Pianos are used exclusively in the New York Conservatory of Music, and are recommended by the Profession and the Press throughout the United States.

Easy Payments for Best Organs.

THE MASON & HAMLIN ORGAN CO., winners of TWO HIGHEST MEDALS and DIPLOMA OF HONOR at PARIS, 1867, VIENNA, 1873, respectfully announce that they now offer their celebrated Cabinet Organs not only exclusively for cash, as formerly, but also on different plans of easy payments which, it is believed, afford purchasers unprecedented inducements.

BOOK AGENTS WANTED
 To sell the **NEW BOOK TELL IT ALL**
 By Mrs. Stenhouse, of Salt Lake City,—for 25 years the wife of a Mormon High-Priest. Introduction by MRS. STOWE. It tells of the "inner life," mysteries, ceremonies, secret doings, &c., of the Mormons. "As a wide-awake Woman sees them." It is actually overflowing with spicy revelations, humor, pathos, and good things for all. Ministers say "God speed it!" Enslaved women endorse it. *Everybody* wants it; and it is selling far and wide by thousands. Over 3,000 outfits were ordered in advance of publication, and Agents are selling 15 to 25 a day! We want 5,000 more Agents NOW—men or women. *(Ladies say this book goes like hot cakes)*—and we will mail **Canvassing Book and whole Outfit Free**, to anyone who will canvass. Our large descriptive pamphlets with full particulars, terms, &c., sent free to any one. Reader! send for them. Address, A. D. WORTHINGTON & Co., Hartford, Conn.

TO BOOK AGENTS.

We offer special and extra commissions to agents this fall. Our new books are just ready, and will stir up the reading public. We shall announce them soon. Full information sent on application, and exclusive territory given. No agent, old or new, should make arrangement for books without first negotiating with us. We can and will give agents better books, better terms, and enable them to make more money than any other house.

Wanted—5,000 men and women as local agents, and 1 experienced men and 2 women to act as General and Traveling Agents in the North and South.
 For information of books and agencies address
AMERICAN PUBLISHING CO.,
 Hartford, Conn.

GOOD NEWS

for book agents, and others desiring employment. New books by popular authors. **LITTLE FOLKS IN FEATHERS AND FUR** by OLIVE THORNE, and **THE WAYS OF WOMEN**, by Dr. J. V. C. SMITH. Splendidly gotten up. Beautifully illustrated. Nothing equal to them now offered to agents. **THE LIFE AND ADVENTURES OF KIT CARSON** is still selling rapidly. Over 20,000 already sold. \$30 a week easily made. **STOWE'S SELF-INTERPRETING FAMILY BIBLE**, the finest in the world. Circulars giving full and complete information sent free. Mention the books wanted.
 Address, **DUSTIN, GILMAN & CO.,**
 Hartford, Conn.

NOW
For 1875,
Beginning TO-DAY.
 OUR
Premium List.
New Things,
Good Things,
Useful Things,

That can be obtained **without**
money and with a little effort by

ANYBODY.

Once more the Publishers of the *American Agriculturist* present their friends and readers with a new Premium List full of good things. The experience of many years has taught them that such offers as are here made, of **very large returns for a very little labor**, never fail to be highly appreciated.

Now, reader, here is something for You. Look over the attractive List of Premiums, and especially the descriptions of them. There are many things among these that you would like to possess without having to pay the money for them. Here are *Pocket Microscopes, Gold Pens, Revolving Pencils, Silver-Plated Ware, Knives and Forks, Pocket Knives, Beautiful Toys for the Children, Melodeons, Pianos, Sewing Machines, Knitting Machines, Books, etc., etc., etc.* You have only to make your choice, and then take hold of this pleasant work of getting a club of subscribers sufficient to obtain it. More than **Fifteen Thousand Men, Women, and Children**, in almost all stations and pursuits, have successfully done this, and at least fifteen thousand

may do it **now**. You may as well be one of the fortunate ones, as anybody else. It only needs a little enterprise and the will—with the *will* there will be a *way*. And **now** is the **best time** to begin. As elsewhere announced, every subscriber coming in this month gets this Journal from November to the end of 1875, at the cost of one year's subscription, and that will help our premium collectors very much. There is room in every neighborhood for several premium clubs. Everybody ought to have the paper; its plain, practical information will put money in most people's pockets, and save multitudes from swindlers, and from unprofitable investments of funds and time. So while you are aiding to push the paper into the people's hands, you are engaged in "*doing Good as well as in Making Money.*"

The *American Agriculturist* is one of the best papers to canvass for in the world. Its many beautiful illustrations, its interesting and instructive reading matter, its Household and Boys and Girls' Departments, its intrinsic value in every way, secure hosts of friends wherever it is seen and known. Read three extracts as specimens from many hundreds of persons who have received our Premiums.

"June 1, 1874.

"I am very much pleased with the premiums, [Dictionary and Gun], and could sell them now at a fair price, but can't think of parting with either, although I am not much of a hunter. My watch that I received over two years ago, is an excellent time-keeper. I feel encouraged to do more than ever for the *Agriculturist*, if I should live next year."

"June 26, 1874.

"Premium [Pocket Rifle] received. Thanks. It is beautiful."

"June 24, 1874.

"Please accept thanks for Carver and Fork, which you sent me as Premium for getting a club to *American Agriculturist*. I find them as represented—genuine articles."

Now, what has been done by thousands to their great profit and delight, **You too may do. TRY IT.**

Explanatory Notes.

N. B.

Read and carefully Note the following Items: (a) All subscribers sent by one person count, though from one or a dozen different Post-offices. But....(b) Tell us with each name or list of names sent, that it is for a Premium....(c) *Send the names as fast as obtained*, that the subscribers may begin to receive the paper at once. You can have any time you wish up to July 1st, to complete your list....(d) Send the exact money with each list of names, so that there may be no confusion of money accounts....(e) Old and new subscribers all count in premium clubs, but a portion, at least, should be new names; it is partly to get these that we offer premiums to canvassers....(f) Specimen Numbers, etc., will be supplied free, as needed by

canvassers, but they should be used carefully and economically, and where they will *tel...* (g) Remit money in Checks on New York Banks or Bankers, payable to order of Orange Judd Company, or send Post-office Money Orders. If neither of these is obtainable, Register Money Letters, affixing stamps both for the postage and registry; put in the money and seal the letter in the presence of the Post-master, and take his receipt for it. Money sent in any of the above ways is at our risk; otherwise it is not.

[In the following table is given the price of each article, and the number of subscribers required to get it *free*, at the regular rates, \$1.50 a year and also at the club rates of \$1 a year.] **Description of Premiums on next page.**

☞ Every Premium article is **new** and of the very **best** manufacture. No charge is made for packing or boxing any article in our Premium List. The Premiums, **Nos. 12 to 18, 22 to 26, 29 and 30, 38 to 43, and 59 to 90, inclusive**, will each be delivered **FREE** of all charges, by mail or express (at the Post-office or express office nearest the recipient) to any place in the United States or Territories.—The other articles cost the recipient only the freight after leaving the manufactory of each, by any conveyance desired. See **Description of Premiums on next Page.** [OVER.]

Descriptions of Premiums.

(For number of Subscribers required, see Table, page 393.)

No. 1.—A splendid Tea Set.—This Premium is one of the most elegant ever offered. There are six pieces, viz.: *A Coffee-Pot, Teapot, Sugar Bowl, Creamer, Slop Bowl, and Spoon-Holder*—all of beautiful, uniform pattern, new style, with raised and embossed figure work. They are not the common silver-washed articles, but the best *triple plate*, the foundation being white metal, so as not to show, even when the heavy silver coating may chance to be worn off in any spot by long, hard usage.—These sets are made by the **Lucius Hart Manufacturing Co.**, of Nos. 4 & 6 Burling Slip, New York City, and are warranted by them to be of the *best triple plate*; and each piece bears their stamp. The late Mr. Hart, "the veteran Sunday-School man," was engaged in the same place and business for nearly a quarter of a century. We knew him and his work many years, and took pleasure then in commending and guaranteeing its value to be as represented. We believe the Company which bears his name is fully sustaining his reputation. The amount of silver upon plated ware depends wholly upon the will and integrity of the manufacturer. We could give nearly as good-looking plated ware for less than half the money, but it would not be worth a quarter as much for real use.

No. 2.—Ice or Water Pitcher.—A large, highly ornamental article. It is of the same metal, plating, etc., and by the same makers as No. 1. For 32 subscribers at \$1.50 each, we will include a round Salver of pattern to correspond (value \$5); we add, for 44 subscribers, a large 16-inch oval Salver (value \$14), large enough for two goblets with the pitcher; or for 51 subscribers, the Pitcher, large Salver, and a pair of beautiful Goblets, silver-plated without, and gilded within (value \$37). This complete set is exceedingly desirable, though the Pitcher alone, or that and the small Tray, or Salver, will answer a good purpose, both for *use and ornament*.

No. 3.—Casters.—A handsome pattern, richly chased, of this useful and necessary article for every dining table. By the same makers as No. 1.

No. 4.—Cake Basket.—An elegant pattern, oval-shaped, nicely chased—a very taking, useful, and beautiful table ornament. From same makers as No. 1.

No. 5.—Revolving Butter-Cooler.—This is a really good and useful article. It is so arranged that a very little ice in the holder under the plate will keep butter cool and fresh for a long time on the table, even in the hottest weather. The cover revolves underneath the plate for use, and over for protection. The whole is in four pieces, which can all be taken apart for washing. From same house as No. 1.

No. 6.—One Dozen Tea-Spoons.—**No. 7.—One Dozen Table-Spoons.**—These are "figured tips," Olive-leaf Pattern, all of the same metal, plating, etc., and from the same makers as No. 1. They are far *cheaper* than anything we have found at half the price, and are well worth working for.

No. 8.—One Dozen Table-Forks.—The same description and remarks apply to these as to No. 1. We select as premiums only such articles as we can warrant in quality and price. All these articles come from the **Lucius Hart Manufacturing Co.**

No. 9.—Child's Cup.—A beautiful gift for the little *one-year-old*. It is made by the **Lucius Hart Manufacturing Co.** Triple-plated on the outside and *gilded* on the inside. It never breaks, and will last for many years—indeed, be a life-keepsake.

No. 10.—Child's Knife, Fork, and Spoon.—This also is a beautiful gift for a child. The articles are triple-plated, finely figured with ivy-leaf pattern, and put up in a handsome silk-lined morocco case. From the same house as No. 9.

No. 11.—Moore's Floral Set.—This is a beautiful Premium—a complete set of **Ladies' or Children's Garden Tools** for the cultivation of flowers, consisting of a Floral Hoe, Spade, Fork, and Rake. They are made of the best steel and iron, with finely polished hard-wood handles, light, durable, and highly finished, and each set inclosed in a box. They will be found very convenient in the garden and greenhouse—*useful* pleasing toys for the little folks. Made by the **Moore Manufacturing Company**, Kensington, Ct.

Nos. 12, 13, 14.—Gold Pens: *with ever-pointed Pencils, in extension, coin-silver cases.*—Premium No. 12 contains the best No. 4 Gold Pen; and No. 13 the best No. 6 Gold Pen, which is the same style, but larger. No. 14 contains No. 7 Gold Pen, in Gold-tipped Ebony Holder. Each pen will be sent in a neat leather case by

mail, post-paid. These pens are made by **Geo. F. Hawkes**, No. 66 Nassau St., and have obtained an excellent reputation. We have known the maker and his goods for many years, and can recommend them.

No. 15.—Ladies' Fine Gold Pen, in Rubber Case, Gold Mounted, with Screw Extension, and Gold Ever-pointed Pencil. A beautiful present for a lady teacher or friend. Same maker as No. 12.

Nos. 16, 17.—Paragon Patent Revolving Pencil.—This is a beautiful Pocket Pencil, which is extended or closed by pulling or pressing the head. They are made with great care, and every Pencil warranted to work perfectly. They are gold-plated, and will last for years. We offer two patterns, one for ladies, with ring for chain, at \$1.50 each, and one of heavier and firmer plate, at \$3. Same maker as No. 12.

No. 18.—Payson's Indelible Ink, and Briggs's Marking-Pen Combination.—Payson's Indelible Ink is too well known to need further commendation. It is almost indispensable in the family. Briggs's Marking-Pen has been before the public for fifteen years, and is justly celebrated for all kinds of marking, and particularly for writing upon coarse fabrics. The Pen and Ink are put up in a neat case, being thus portable, always ready for use, and protected from loss or injury by evaporation or breakage.

No. 19.—Child's Carriage, or Perambulator.—An elegant carriage, handsomely finished, upholstered with reps, has full plate tinned joints, handle tips, side lights, dash rail, panel body, and carpet on the bottom. These carriages are from the well-known manufacturer **C. W. F. Dare**, 47 Cortlandt St., N. Y.

No. 20.—Child's Patent Propeller or Self-Operating Swing.—A pleasing thing for a little boy or girl. The seat of the swing is upholstered with enameled cloth, showily painted, and hooks and all complete accompany it. When it is hung up, the hooks overhead to which the lever ropes are attached, must be set about one foot in front of the hooks to which the main ropes are attached. A child is delighted with being able to swing himself. From **C. W. F. Dare**, 47 Cortlandt St., New York.

No. 21.—Doll's Cottage Chamber Set.—A most attractive gift for a little girl. Eight pieces of furniture prettily painted: Bedstead (size 11½ × 18 inches), bureau, table, commode, towel-rack, two chairs, one rocking-chair. From **C. W. F. Dare**, 47 Cortlandt St., New York.

No. 22.—Crandall's Improved Building Blocks furnish a most attractive amusement for children. Churches, Dwellings, Barns, Mills, Fences, Furniture, etc., in almost endless variety, can be built with them, and the structures remain so firm as to be carried about. For developing the ingenuity and taste of children they are unequalled. The Blocks are put up in neat boxes, accompanied by a large illustrated sheet giving various designs of buildings, etc. This is one of the most successful toys ever invented.

No. 23.—Crandall's Masquerade Blocks.—These are put up in boxes; the blocks in each box will make, by various combinations, **300 different pictures** in brilliant colors. They are not injured by washing, and afford endless amusement for children. They are beautiful gifts for the little ones.

No. 24.—Crandall's Acrobats.—The most attractive, amusing and wonderful toy of the age. Children everywhere, who have seen the Acrobats, are delighted with them. Thousands of figures can be made from the pieces in a single box. The pieces are variously colored, and there is no end of fun in a box of them.

No. 25.—Pocket Tool Holder.—Every boy will be glad to get hold of this Premium. In a maple handle, which is hollow, with a lignum-vitæ head, are packed twenty miniature cast steel tools, either of which may be adjusted to the handle. It will also hold anything from an 8 inch mill file to a cambric needle. Made by the **Miller's Falls Manufacturing Co.**, 78 Beekman St., New York.

No. 26.—Bracket Saw.—Although this is a little thing, size of frame being about 6 × 12 inches, it is sufficient for the manufacture of very many ornamental and useful articles, as Book Rests, Brackets, Boxes, etc., which the ingenuity of any person, young or old, may devise. The frame is rosewood highly polished, and the saws of tempered steel, four of which, with Designs and Directions, are sent with the frame. Made by the **Miller's Falls Manufacturing Co.**, 78 Beekman St., New York.

No. 27.—"People's Pump."—What every country family needs. An in-door Force Pump for

1½ inch Suction Pipe; capacity 15 to 18 gallons per minute. These pumps are tested to 150 pounds pressure, and will throw water from a hose pipe 50 feet high, and 80 feet horizontally. Being operated by a side shaft entering through the air chamber, there is no piston rod to wear out brass stuffing box as in other pumps. They are among the most powerful, simple, and durable pumps to be had. The case with which any part can be renewed in case of accident, or access had to the interior for repairs, commends them for greenhouses, farmers, and stockmen, as well as for city use. Awarded Medal of American Institute, as the Best Force Pump of all exhibited, Nov. 15th, 1873. None genuine without "People's Pump, Patented Aug. 31st, 1869," cast on the lid. Send for circular to **W. S. Blunt, Manufacturer**, 77 Beekman St., New York, and secure a *free* one for your own use, (or for sale at \$12.) by simply sending us 19 subscribers.

No. 28.—Non-Freezing Outdoor Force Pump.—This is another style of the popular "People's Pumps," and by the same manufacturer. The description of Premium No. 27, is also applicable to this, and while that is designed for in-door, this is for outdoor service. For seven additional subscribers at \$1.50 each, we will send, with either of the above pumps, 4 feet of *hose, couplings, and brass hose-pipe*, price \$3.

No. 29.—Excelsior Pocket and Dissecting Microscope.—This is a beautiful little instrument, the application of which to the examination of numberless objects, makes it most interesting to child or man, whether in the country or city, on the farm, in the workshop or warehouse. The microscope here offered is supplied with *Three Lenses*, and is packed in a neat case for the pocket. The microscope was patented by J. J. Bausch of Rochester, N. Y. It is manufactured by the **Vulcanite Optical Instrument Co.**, and is for sale by dealers in optical instruments generally. One of these, which reveals many interesting things unseen by the unaided eye, ought to be in *every* family, and here is a chance to obtain one *free*, by simply sending us seven subscribers, every one of whom will get his money's worth in the paper, and, should you choose to be accommodating, may also enjoy the loan of your microscope.

No. 30.—Pocket Soap Bubble Toy.—Two of these Toys, which greatly please all the boys and girls, will be given for this Premium, and almost any child can readily get 3 subscribers at \$1.50 each, and thus secure one of these for himself and another to give away. It may be carried in the pocket, and can be used for blowing bubbles in-doors or out. Directions accompany each one. Manufactured by **S. B. Bliss**, 34 Barclay St., New York.

No. 31.—Turn-table Apple Parer, Improved.—**No. 32.—Climate Apple Corer and Slicer.**—**No. 33.—Family Cherry Stoner.**—All the above little machines, which are most useful in every household where apples and cherries are to be cared for, are manufactured by **D. H. Goodell**, Antrim, N. H., and 99 Chambers St., New York. We have never seen the work, for which these machines were contrived, more rapidly or better done than they will do it. The Apples are pared, cored, and sliced with the greatest facility, and the Cherries are readily relieved of their stones, leaving the fruit in good shape. Only three subscribers each are required to get one or more of these.

Nos. 34, 35, 36.—American Table Cutlery.—We are glad to be able to offer really good articles of American manufacture, such as are competing successfully with the best foreign make. **Messrs. Patterson Bros.**, 27 Park Row, who supply us with these articles, are also importers of English goods. They recommend these Knives, manufactured by the **Meriden Cutlery Co.**, as equal to any Cutlery in the market, and their recommendation is a guarantee wherever they are known. We offer two kinds of Knives, and three sizes on each kind. No. 34 have Rubber Handles, which are actually boiling-water proof, so that, if they were accidentally to remain in it for several minutes, or even hours, they would not be injured. The Blades are of the best steel, and warranted. Dessert size, with Forks, sold at \$15.25. . . . For 27 subscribers at \$1.50, or 90 at \$1, we will give either the medium size or the table size, sold at \$16.75. No. 35 have Ivory Handles, are selected with great care, have Steel Blades, and are beautiful goods. Dessert size, with Forks, sold at \$19.00. . . . For 33 subscribers, at \$1.50, or 110 at \$1, we will send the medium size, sold at \$22.00. . . . For 35 at \$1.50, or 116 at \$1, we will send the Table size, sold at \$23.00. The Forks, which accompany these Premiums, Nos. 34 and 35, are made of genuine Albata, and warranted *double-plated with coin-silver*. These Forks are furnished to us by Messrs. Patterson Bros. . . . The Carving-Knife and Fork are made by **The Meriden Cutlery Co.**, with the best Ivory, balanced Handles.

No. 37. — French Cook's Knife, Fork, and Steel.—This is a long (10 in.) thin Knife, with Pat. Rubber Handle, made of the best steel, and for use rather than ornament; and it is really pleasing to see how easily it slips through a joint of beef. The fork and steel are made to match. It would save many wry faces, and perhaps hard words, were it in general use. Made by the **Meriden Cutlery Co.**

Nos. 38, 39, 40, 41. — Pocket Knives.—HERE'S FOR THE BOYS AND GIRLS!—These Premiums are among the most pleasing and useful that we have ever offered. Every boy, and girl too, wants a pocket knife. We give them an opportunity to obtain a most valuable one for merely a little effort. These knives are furnished by the **Meriden Cutlery Co.**, 49 Chambers Street, New York, whose work is equal to any done in this country or Europe. No. 38 is a neat, substantial Knife, with three blades and buck-horn handle. No. 39 is a still finer article, with four blades and pearl handle. No. 40 is an elegant Knife, with five blades and shell handle. No. 41 is a Lady's Pocket Knife, a beautiful article, with four blades and shell handle.

No. 42. — Multum in Parvo Pocket Knife.—**Boys, Read this.**—This is a most attractive as well as useful Premium, from the **Meriden Cutlery Co.**, 49 Chambers Street, New York. It comprises, in one knife-handle, a large and a small blade, a screw-driver, a saw, a strong hook, a nut-cracker, a brad-awl, a gimlet, a corkscrew, a pointer, a slim punch, tweezers, and, in addition to this, it can be used for various other purposes which will at once suggest themselves to any smart boy or man. It is a pocketful of tools weighing but two ounces. The knives will be sent anywhere in our country, post-paid.

No. 43. — Very Choice Garden Seeds and Flower Bulbs.—We have taken special pains to have prepared by **Messrs. B. K. Bliss & Sons**, 34 Barclay Street, New York, (whose seed establishment is well known as one of the best in the country,) a list of Seeds and Bulbs of the *very choicest kinds*, and the most useful varieties. Though some are rare (and costly), all have been tested and found excellent. Here is an opportunity to obtain a valuable assortment of seeds, as this premium allows you to select from the list below any that may be desired, to the amount of **two dollars**. If more seeds are wanted, it is only needful to secure two or more of the premiums, and select seeds accordingly. *All delivered free:* 1 pint New Dwarf Wax Beans, 50c.; 1 pkt. Beet, New Egyptian Blood Turnip, 15c.; ½ ounce of Perpetual Spinach, 25c.; 2 oz. of Lane's Improved Imperial Sugar, 25c.; 1 pkt. Early Wyman Cabbage, 25c.; ½ oz. of Marblehead Mammoth, 50c.; ½ oz. of Improved American Savoy, 25c.; ¼ oz. of Improved Brunswick, 25c.; ½ oz. of Premium Flat Dutch, 20c.; ½ oz. of Improved Red Dutch, for pickling, 25c.; ¼ lb. Carrot, Bliss's Improved Long Orange, 50c.; 1 pkt. Cauliflower, either the Early White Erfurt, or the Early Paris, 25c.; ½ oz. Celery, Boston Market, 25c.; 1 oz. Cucumber, finest for pickling, 25c.; 1 pkt. New Black Pekin Egg-Plant, 25c.; 1 pkt. Kale, New Garnishing, 25c.; ½ oz. Lettuce, Early Simpson, 25c.; 1 pkt. Muskmelon, either the Hackensack, or Sill's Hybrid, 15c.; 1 pkt. Onion, either the New Queen, or New Giant Rocca, 15c.; 1 pint Peas, Laxton's Alpha, 25c.; 1 pint Peas, McLean's Little Gem 30c.; 2 oz. True Boston Marrow Squash, 50c.; 2 oz. of Turban do., 50c.; 2 oz. of Genuine Hubbard do., 50c.; ½ oz. of Marblehead do., 25c.; 2 oz. Tobacco, Conn. Seed Leaf, 50c.; 1 oz. Arlington Tomato, 50c.; 1 pkt. Grapeshot do., 15c.; 1 Lilium auratum, or New Gold-banded Lily, from Japan, 50c.; 1 Lilium lancifolium rubrum, Japan Lily, red, 40c.; 1 Lilium lancifolium album, Japan Lily, white, 40c.; 1 doz. Gladioluses, fine mixed varieties, \$1.50; 1 doz. Mexican Tiger Flowers, \$1.25; 1 doz. Tuberoses, Double Italian, best, \$1.50; 1 doz. Hyacinths, double and single, in three colors, red, blue, and white (for fall planting), \$1.50; 4 doz. Tulips, double and single, early and late (for fall planting), \$2.00; 100 Crocuses, fine varieties (for fall), \$1.00.

No. 44. — Automatic Family Knitting Machine.—Here is a Premium which many families will be glad to obtain. These Knitting Machines are very easily managed, not liable to get out of order; they can be attached to an ordinary table and worked by a child. They are adapted to the production of a great variety of work, both of plain homespun for wearing apparel and elaborate crochet stitching of the most varied character, limited only by the skill and taste of the operator. Indeed, the ingenuity and taste of ladies may be constantly stimulated by inventing and successfully producing new forms and styles, making it a source of pleasure as well as of profit. The following articles may readily be knit on these machines, in any design, form, color, or stitch: *Socks, Stockings, Mittens, Leggings, Wristslets, Gloves, Scarfs, Sashes, Capes, Drawers, Undershirts, Skirts, Ties, Trimmings, Tuffings, Toilet Mats*, etc., etc. The machine offered is the No. 1 style, price \$35. For 62 subscribers at \$1.50 each, or 192 at \$1 each, we will give one of the No. 3 style, price \$45. Manufactured by the **New York Knitting Machine**

Co., 689 Broadway, New York, who will supply descriptive circulars upon application to them.

No. 45. — Secor Sewing Machine.—“A good Sewing Machine lightens the labor and promotes the health and happiness of those at home.” We offer one of the best of the leading machines, and it is one which has been thoroughly tested and gives entire satisfaction. While all of the high-cost machines are valuable, each has some excellence peculiar to itself. The **Secor** machine is claimed to be as absolutely near perfect as human genius has yet devised, and to comprise the *fewest number of pieces* of any lock-stitch machine. Its tension is very simple, and no change is required in passing over seams. It will sew *from tissue paper to leather*. The tension-plates are close to the needle, and if the thread is cut from the spool, will work until the thread is exhausted. The needle is *self-setting*, short and straight, and as it can only be put in one way, can not be set wrong. All the works being above the table, they are easily oiled and cleaned.—These machines have constantly increasing sales, showing the public estimate of their value. One of them will prove a great treasure in any household—worth more than \$500. The \$500, at 7 per cent interest, would yield (less taxes) about \$32. Most families require at least four months of steady hand-sewing a year, costing, if all hired, not less than \$24 a month, board included, or \$96 a year. With a Sewing Machine, a woman can sew more in one month than in four months by hand. Here is a clear saving of \$72. But far above this—the everlasting “Stitch, stitch, stitch,” the bending over the work, and the loss of sleep, have brought tens of thousands to early graves. We say to *every man*, Get your wife a Sewing Machine, even if you have to sell a favorite horse or an acre or two of land—get the Sewing Machine any way. If you can get one through our premium-list—well; but get the machine.—No charge for boxing the machines. They go safely as freight. Send for circulars, giving full instructions, to **Secor Sewing Machine Co.**, 900 Broadway, N. Y.

No. 46. — Beckwith Portable Family Sewing Machine.—This Machine is well and strongly made, is simple, its use being quickly learned, is applicable to almost all kinds of family sewing, and has already been tested so thoroughly that hundreds of testimonials, from all quarters, have been given by the who are delighted with its work. The new Portable Machine, price \$20, which we now offer, comprises all the excellencies of the lower priced machine first sold by the Beckwith Co., with many valuable improvements. Its size and power are increased, and its capacity thus very much enlarged, without impairing its portability. There have been added cam and eccentric movement, a balance-wheel, and also an oscillating needle-clamp, by which the length of stitch can with the greatest ease be changed to the finest shade of variation without touching the needle. Each machine is put in a neat, compact box, with *hemmer and guide, oil-can with oil, thread, different-sized needles, etc.*, with full printed directions for using. We will sell these machines (packed in a neat, portable case, with handle to carry it easily) to any one who may wish to buy, for \$20 each, delivering to any express office in *this city*, or give them as in Premium List.

No. 47. — Doty's Improved Clothes Washer, with the Metropolitan Balance Weight. Over seventy-five thousand families in the United States are using the Doty Washing Machine, and we believe the improved machine has no superior. The “help” use it and like it. Send for descriptive circulars to **R. C. Browning**, 32 Cortlandt St., New York, or to **Metropolitan Washing Machine Co.**, Middlefield, Ct. It goes cheaply by freight or Express.

No. 48. — Universal Clothes Wringing Machine.—A very useful, time-saving, strength-saving, clothes-saving implement, that should be in *every family*. The wringing of clothes by hand is hard upon the hands, arms, and chest, and the twisting stretches and breaks the fibers with lever power. With the Wringing Machine, the garments are passed rapidly between elastic rollers, which press the water out better than hand wringing, and as fast as one can pick up the articles. We have given thousands of these premiums, with almost universal satisfaction. They are made by the **Metropolitan Washing Machine Co.**, Middlefield, Ct. **R. C. Browning**, 32 Cortlandt St., New York.

No. 49. — Melodeons.—These are excellent and desirable instruments, for the *Home Circle*, for small Churches, for Sunday-schools, for Day Schools, Academies, etc. Instrumental and Vocal Music in a school has a beneficial influence upon the pupils. We have seen the whole tone and character of a school improved by introducing a Melodeon.—Set the pupils to work and they will raise a club of subscribers for this premium. We offer the Melodeons made by **Messrs. Geo. A. Prince & Co.**, Buffalo, N. Y., for we know them to be good.—Several clergymen have obtained this premium for themselves, their Churches, or Sunday-school rooms. The clubs of subscribers were quickly raised among the members of their parishes.—Many others can get a

Melodeon for their *home use*. Send a postage-stamp to the makers and get their illustrated descriptive circular. These Melodeons will be shipped direct from the manufactory at Buffalo. They can go safely as freight or by express. If an Organ should be wanted instead of a Melodeon, we can supply it for an increased number of subscribers in proportion to the value.

No. 50. — Steinway Piano.—SEVEN OCTAVE ROSEWOOD CASE, SOLID ROSEWOOD DESK, LARGE FRONT, ROUND CORNERS; OVERSTRUNG BASE, FULL IRON FRAME, PATENT AGRAPPE TREBLE, CARVED LEGS, AND CARVED LYRE.—This is one of the most elegant Premiums ever offered; regular and only price \$650. That this magnificent instrument comes from the celebrated establishment of **Messrs. Steinway & Sons**, Nos. 109 & 111 East 14th St., N. Y., is enough to say; but it is due to these enterprising manufacturers to state that while their pianos have repeatedly received the **FIRST PREMIUMS**, by the award of the most competent judges the world can produce, at the Universal Exposition, in Paris they received the **FIRST GRAND GOLD MEDAL**. The following official certificate was signed by the President and the five members of the International Jury: “Paris, July 20th, 1867. I certify that the First Gold Medal for American Pianos has been unanimously awarded to Messrs. Steinway by the Jury of the International Exhibition. First on the List in Class X.” The Jury on Musical Instruments at the World's Fair, 1873, (where Steinway & Sons did not exhibit their pianos), passed the following unanimous resolution: “It is much to be deplored that the celebrated inaugurators of the new system in Piano-making, Messrs. Steinway & Sons, of New York, to whom the entire art of Piano-making is so greatly indebted, have not exhibited.” The world renowned Artists and Composers, Dr. Franz Liszt and Anton Rubinstein, use the Steinway pianos exclusively, and pronounce them the standard pianos of the world. Many of the best judges in America say the same. We also speak from personal knowledge, as two of our officers have for years each had one at home. This splendid premium may be secured by many persons. *Many Ladies* have secured this premium, and some have obtained two or more, and sold the extra ones, thus securing large salaries. Classes of young ladies at school can unite in canvassing, and obtain a present for a Teacher, or a Piano for their school-room. We shall be glad to give this premium to a large number. Send to **Messrs. Steinway & Sons, N. Y. City**, for a free circular describing it.

No. 51. — A Good Watch.—The Watches made by the **American Watch Co., Waltham, Mass.**, have peculiarities of excellence which place them above all foreign rivalry. The substitution of machinery for hand labor has been followed not only by greater simplicity, but by a precision in detail, and accuracy and uniformity in their time-keeping qualities, which by the old method of manufacture are unattainable. A smoothness and certainty of movement are secured which proceed from the perfect adaptation of every piece to its place. The extent of the Waltham establishment, the combination of skilled labor with machinery perfect and ample, enable them to offer watches at the lowest rates. Their annual manufacture is said to be double that of all other makers in this country combined, and much larger than the entire manufacture of England. The mechanical improvements and valuable inventions of the last fifteen years, whether home or foreign in their origin, have been brought to their aid, and the presence of nearly 800,000 Waltham Watches in the pockets of the people is the best proof of the public approval. We offer a Silver watch, jeweled, with chronometer balance, warranted by this Company as made of the best materials in the best manner, and in pure coin-silver “hunting” case; weight 3 oz. This watch we offer as one of our Premiums, with the fullest confidence. Upon the movement of each of these watches will be engraved, “**AMERICAN AGRICULTURIST. MADE BY THE AMERICAN WATCH CO., WALTHAM, MASS.**”

No. 52. — Breech-loading Pocket Rifle.—This remarkable little fire-arm weighs only eleven ounces, yet shoots with great accuracy and power from 30 to 100 yards, or more, and can be loaded and fired five times a minute. It can be carried in a side pocket, and is accompanied by an extension breech, so that it may be used either as a pistol or rifle. It is put up in a neat mahogany case, with 250 rounds of ammunition. The manufacturers are **Messrs. J. Stevens & Co.**, Chicopee Falls, Mass., and the rifles are sold at retail by **Mr. Edwin S. Harris**, No. 177 Broadway. Without the mahogany case, we will give the weapon, all complete, with 100 cartridges, packed in a pasteboard box, on receipt of 18 subscribers, at \$1.50 each.

No. 53. — Double-Barrel Gun; OR FOWLING PIECE.—These guns are the genuine London “Twist” barrel, Patent Breech, Bar Lock, ebony ramrod, and in all respects desirable. Their caliber and length of barrel vary, and may be ordered to suit the kind of shooting to be done. They are furnished for this Premium by **Mr. Edwin S. Harris**, 177 Broad-

way, well known as one of the most reliable and best dealers in his line of business, and he highly recommends this particular gun, and guarantees it in every respect. It is from one of the oldest and most favorably known English manufacturers. The price is not put on in fancy carving and plating for show, but in the gun itself. This Premium includes the Gun, Powder-Flask, Shot-Pouch, and Wad-Cutter.

No. 54.—Chas. Pratt & Co's Astral Oil supplies a great Public Want for a *Safe, Reliable Illuminating Oil*. It is manufactured by them and packed only in the Guarantee Patent Cans, expressly for FAMILY USE. It has more body, and an equal quantity will burn longer and give more light than other oils. The constant recurrence of explosions, fires, devastation, and death resulting from the use of what is called Kerosene Oil—but really a mixture of Benzine, Naphtha, and other highly inflammable substances, the use or sale of which is an infringement of United States Law—has induced us to place this article on our premium-list as a humanitarian as well as a useful act. The Board of Health of the city of New York have examined scores of samples of Oil obtained from as many different dealers in this city, and nearly all have been found far below the Government standard and entirely unfit for use. This "Astral Oil" is from the House of **Chas. Pratt & Co.**, 108 Fulton St., N. Y., merchants of high reputation, who will keep up the article to its present standard. It has been tested, and fully indorsed by the highest scientific authorities in the land. The Guarantee Cans are made of tin, and sealed so that none of the oil can be removed without breaking the seal, thus securing safety in transportation. The can is inclosed in a strong wooden case, and may be returned for refilling cheaply. For 17 subscribers at \$1.50, we will send a case containing 12 one-gallon Guarantee Cans of Oil, which may be distributed among a club.

No. 55.—Cahoon's Broadcast Seed-Sower.—The Hand Seed-Sower is the one offered as our Premium. It sows from four to eight acres per hour, at a common walking gait, throwing wheat and rye from 30 to 36 feet wide; barley, 30 feet; hemp, 28 feet; oats, 23 feet; clover, Millet and Hungarian seed, 22 feet; and Timothy, 18 feet. Manufactured by **D. H. Goodell**, Antrim, N. H.

No. 56.—Comstock's Horticultural Implements Combined or Separate.—These hand implements comprise, in simple combinations, a *Wheel Seed Sower, Wheel Cultivator and Onion Weeder, Wheel Rake, Wheel Scuffle Hoe, Wheel Shovel Plow, Wheel Strawberry Runner Cutter, Wheel Mole Plow, and Wheel Verge or Turf Cutter.*—The changes for each kind of work can be made in a few minutes, and every implement of the combined machine works as well as if made specially for the purpose. The same frame, wheel, and handles answer for all the combinations. The price of the Hand Cultivator and Weeder is \$9.25 (see our Premium in the Table); with Seed-Sower combined \$15.35, which we will give for 23 subscribers at \$1.50 or 78 at \$1. The following are extra attachments for the Cultivator and Weeder, which may be secured by sending us, in addition to the above, the same number of subscriptions required for any other Premium of same cost: *Strawberry Cutter, \$3.00; pair of Half-share Teeth, \$1.00; set of Shovel Plows, \$2.00; Mole Plow, \$1.00; a Verge-Cutter for cutting and cleaning the turf edges of walks and borders, an exceedingly valuable invention, \$1.50; Scuffle Hoe, for scraping walks and alleys, \$1.50.* They have given so much satisfaction the five years we have furnished them as Premiums that we continue them on our Premium List. Manufactured by **Comstock Brothers**, East Hartford, Ct., who furnish descriptive circulars to all applicants.

No. 57.—Family Scales.—These scales, combining the advantages of counter and platform scales, are peculiarly adapted to household purposes. They weigh from ½ ounce to 240 lbs. They have a scoop, or pan, for weighing flour, sugar, or other house stores, and a platform for heavier articles, and are just such an apparatus as is needed for in-door or out-door use, occupying less than 2 feet square. These scales are manufactured by the well-known **Fairbanks & Co.**, No. 311 Broadway, New York, whose weighing apparatus has long ranked as the standard in all parts of the country. Send to them for circulars, if desired.

No. 58.—The Great Dictionary.—WORCESTER'S LARGE PICTORIAL UNABRIDGED EDITION, containing 1854 three-column pages, with a multitude of illustrative engravings. (The work is a large quarto volume.) Most of the thoroughly educated men of the country consider this as by far the best Dictionary in the English Language. It gives the spelling and pronunciation of every word in the language with full explanations, and as a source of general information stands next to a Cyclopaedia. The Dictionary can be called for at our office, or be sent by express or otherwise to any part of the country. It should be in every family. It is published by **Brewer & Tileston**, Boston.

Nos. 59 to 67.—Volumes of the American Agriculturist (Unbound).—These amount to a *large and valuable Library* on all matters pertaining to the Farm, Garden, and Household, and contain more varied information on these subjects than can be obtained in books costing three times as much. The price of the volumes is \$1.50 each, at the Office, or \$1.75 if sent by mail, as they must be post-paid.—They are profusely illustrated, the engravings used in them having alone cost at least \$100,000. Those obtaining premiums for less than eighteen volumes can select any volumes desired, from XVI to XXXIII inclusive. For ordinary use, the sets of numbers unbound will answer.

Nos. 68 to 77.—Bound Volumes of the Agriculturist.—These are the same as Nos. 59 to 67 above, but are neatly bound in uniform style, and cost us more for binding and postage. Sent post-paid.

Nos. 78 to 89.—Good Libraries.—In these premiums, we offer a choice of **Books** for the **Farm, Garden, and Household.** The person entitled to any one of the premiums 78 to 89 may select any books desired from the list of our books published monthly in the *American Agriculturist*, to the amount of the premiums, and the books will be forwarded, *paid* by Post or Express. Let the farmers of a neighborhood unite their efforts, and through these premiums get an agricultural library for general use. See Table List of Books in advertising columns, or send for Catalogue.

No. 90.—General Book Premium.—Any one sending 25 or more names, may select books from our list to the amount of 10 cents for each subscriber sent at \$1; or 30 cents for each name sent at \$1.20; or 60 cents for each name at \$1.50. *This offer is only for clubs of 25 or more. The books will be sent by mail or express, prepaid through, by us.* See List as in No. 89.

Now
IS THE TIME TO MAKE AND TO
Save Money.
— READ HERE
How To Do It.

The Publishers of this Journal have received verbal and written testimonials from thousands of subscribers, in substance as follows:

"I have taken the *American Agriculturist* for many years. It has paid for itself a hundred times in the information it has given me."

"Your paper, with its beautiful pictures and valuable articles, is always a welcome visitor to our household."

"My son says that what he has learned about farming from the *Agriculturist*, will make him a better farmer than his father. I wish I could have seen it when I first began farming."

"Our young folks are always in a hurry to get at the 'Boys' and Girls' Columns.' Who is 'The Doctor?'"

"My wife says no farmer's wife ought to be without the *American Agriculturist*. She values highly the Household Department."

"The *Agriculturist* was taken by my good father for twelve years, and I shall never fail to have it, so long as I can raise \$1.50 a year for such a paper."

"I made more than five hundred dollars from practicing upon the hints in one single article in the *American Agriculturist*."

"How can you possibly afford so valuable a paper at so small a price?"

Now, WHAT is the
American
Agriculturist?

It is a beautifully illustrated Journal, established in 1842, for the **Farm, Garden, and Household**, including a special in-

teresting and instructive Department for **Children and Youth.**

It is a large periodical of 44 pages, well printed, and filled with *plain, practical, reliable original matter*, including hundreds of **beautiful Engravings** in every annual volume.

It contains each month a Calendar of Operations to be performed on the **Farm, in the Orchard, Garden, and Dwelling**, etc.

It comprises thousands of hints and suggestions, in every volume, prepared by practical, intelligent, **working men**, who know what they write about.

It has a **Household Department**, valuable to every Housekeeper, affording very many useful hints and directions calculated to lighten and facilitate in-door work.

It has a **Department for Children and Youth**, prepared with special care, to furnish not only amusement, but also to inculcate knowledge and sound moral principles.

When the large expense involved in providing its interesting and varied reading matter, and its great number of superb illustrations, is considered, it is the

Cheapest Paper in the World.

Its subscription price is only **\$1.50 a year**; four copies for \$5; ten copies for \$12; twenty, or more, \$1 each; to which ten cents must be added and sent with *each subscription*, whether singly in clubs, to pre-pay postage for the year 1875, which must be done here, by the Publishers.

BETTER YET.

To every Subscriber for 1875, (received in October,) that is, for the whole of Vol. 34, the Publishers will present an exquisite Chromo, *as detailed below*, and in addition to this, each subscriber, whose subscription is received during October, will get the remaining two numbers of the current year, *i. e.*, November and December, **without extra charge.**

As long as any of both Chromos are in stock, a choice will be given to new subscribers of either one of the two beautiful pictures

"Up for Repairs,"
"Mischief Brewing,"

but the choice must be named at the time of subscribing.

The chromo selected will be delivered at 245 Broadway *free of charge*. If to go by mail, 10 cents extra must be sent to cover cost of packing and postage. **For 25 cents it will be Mounted, Varnished, Packed, and sent Post-paid.**

N. B.—The Chromo will be delivered:

At the office, **Unmounted, Free.**

" " " **Mounted, 15 cents extra.**

Sent by Mail, **Unmounted, 10 cents extra.**

" " " **Mounted, 25 cents extra.**

IF YOU WANT A FARM OR HOME,

YOU SHOULD BUY OF THE

BURLINGTON AND MISSOURI RIVER RAILROAD CO.

IN IOWA OR NEBRASKA.

- BECAUSE**—Their prices are low, ranging for the best land from Three to Ten Dollars per acre.
- BECAUSE**—No payments are required of the purchaser for four years, except interest at six per cent.
- BECAUSE**—After the fourth year only one seventh of the principal is payable annually till the whole is paid.
- BECAUSE**—You are not required to go into a wilderness, these being well-settled States, the population of which is rapidly increasing.
- BECAUSE**—The mildness of the climate and fertility of the soil is such that the settler can pay for his farm from the products raised upon it long before the time when the principal becomes due.
- BECAUSE**—Failure of crops from drouth is unknown.
- BECAUSE**—Large allowances are made upon fare and freight, thus giving low rates on both to purchasers of this Company's lands.

AND YOU SHOULD BUY THIS YEAR.

BECAUSE—Purchasers of our lands in Nebraska during 1874 who cultivate one-half their land within two years from their purchase are allowed a reduction of twenty per cent on its price. **LARGE DISCOUNTS** also, FOR CASH, within One, Two, or Five Years.

Send for Circulars, with full information on all points, to

CADY'S PATENT IRON SLEIGH KNEES

Have been tested thoroughly the past five years, and are in
use in almost every Northern State; we have yet to hear of
the first instance wherein they have failed to give entire
satisfaction. We can not express the approval with which
these Knees are received by the public, better than to refer
you to the following, which express the sentiments of hun-
dreds of letters in our possession.

ARE CHEAPER, MORE DURABLE,
NO JOINTS TO DECAY.

WILL CARRY DOUBLE THE
LOAD OF A WOODEN KNEE.

"The Sleighs I built with your Knees are the cheapest and
most durable I ever built. When they are put together,
they are half ironed. A man with half a head and but few
tools can build his own Sleighs."
H. W. HUBBARD, East Springport, Michigan.

"We have used your Knees in the manufacture of our
sleighs for the past 3 years, and have found them to be a
decided success in every particular."
SAUNDEISS & BARETT, Oneida, N. Y.

"Your Iron Sleigh Knees are an excellent thing. We have
used them on our rough roads with very heavy loads, and
they have stood the test. They are a Godsend to Farmers
living away from opportunities, and compelled to build their
own sleighs."
F. G. FINCKE, Bellasylva, Pa.

"I warrant my Bob-sleighs made with your Knees to carry
any Saw-log, or a load that a Team of Horses can draw."
ALANSON SHERMAN,
Palmyra, N. Y., Carriage Manufactory. Established 1828.

See illustration and description in *American Agriculturist*

Table listing books for stock-keepers, including titles like 'O. J. Co. keep in Stock the following Books: Architecture, By Cummings & Miller', 'Bicknell's Village Builder', and 'Bridgman's Young Gardener's Assistant'.

THE CULTIVATION OF THE WILLOW OR OSIER.

BY WILLIAM SCALING, Ten Years Basket Maker to Her Majesty and the Royal Family.

This little pamphlet, though written by an Englishman, and of course designed specially for cultivators among his countrymen, contains just those practical instructions for the planting and culture of the willow, which many among us will be glad to receive. It was designed to enable any one unacquainted with the cultivation of willows, for basket purposes, to grow them successfully.

Price, Post-paid, 25 Cents. ORANGE JUDD COMPANY, 245 BROADWAY, NEW YORK.

Newly Revised and Enlarged Edition. Practical Floriculture.

A Guide to the Successful Propagation and Cultivation of Florists' Plants.

By PETER HENDERSON, Author of "Gardening for Profit."

Beautifully Illustrated. Price, Post-paid, \$1.50.

In this work, which has everywhere become so deservedly popular, not only is the whole "art and mystery" of propagation explained, but the reader is taught how to plant and grow the plants after they have been propagated. The work is not one for florists and gardeners only, but the amateur's wants are constantly kept in mind, and we have a very complete treatise on the cultivation of flowers under glass, or in the open air, suited to those who grow flowers for pleasure as well as those who make them a matter of trade. The work is characterized by the same radical common sense that marked the author's "Gardening for Profit," and it holds a high place in the estimation of lovers of floriculture. The new edition has been thoroughly revised by the author, and much enlarged by the addition of valuable matter.

The following are a few of the subjects embraced in the latest edition:

- Laying out Flower Garden and Lawn; Designs for Grounds and for Greenhouses; Soils for Potting; Cold Frames; Hot-Beds; Greenhouses Attached to Dwellings; Modes of Heating; Propagation of Plants by Seeds and by Cuttings; Culture of the Rose and Tuberoses; Growing of Winter-flowering Plants; Construction of Bouquets, Baskets, etc.; Parlor and Window-Gardening; Wardian-Cases and Ferneries; Insects; What Flowers Grow in the Shade; Culture of Grape-Vines under Glass; The Profits of Floriculture; How to Become a Florist, etc., etc.

Window Gardening.

By HENRY T. WILLIAMS, EDITOR OF THE HORTICULTURIST, AND HORTICULTURAL EDITOR OF THE NEW YORK INDEPENDENT. FINELY ILLUSTRATED.

There can be no more attractive ornaments about the house than beautiful flowers, and Mr. Williams's book tells exactly how they may be arranged, and what flowers to plant. It is seldom that a book is published on such subjects containing so much practical information.

-The World (New York).

Table listing contents of 'Window Gardening' book, including chapters like 'Window Gardening - Its Pleasures - Increase in Popular Taste - Refining Influences', 'Location and Designs for Window Gardens', etc.

Price, post-paid, \$1.50. Either of the above books sent post-paid on receipt of price by

ORANGE JUDD COMPANY, 245 BROADWAY, NEW YORK.

FRAMES FOR THE CHROMOS.

We have made arrangements to supply frames to our subscribers who may desire them for the Chromos which we have distributed. Many will no doubt avail themselves of this opportunity to place these beautiful pictures in handsome frames at moderate cost. In all cases where sent by express, the purchaser will pay express charges. The prices of the frames are as follows:

For the Chromo, "UP FOR REPAIRS," Or for the Chromo, "LOOK OUT!"

Table listing prices for 'UP FOR REPAIRS' and 'LOOK OUT!' frames, including 'Letter A. Neat Black-Walnut Frame, Gilt Band... \$1.15'.

For the Chromo, "MISCHIEF BREWING."

Table listing prices for 'MISCHIEF BREWING' frames, including 'No. 1. Neat Black-Walnut Frame, Gilt Band... \$1.15'.

For the Chromo, "THE STRAWBERRY GIRL."

Table listing prices for 'THE STRAWBERRY GIRL' frames, including 'No. 8. Neat Black-Walnut Frame, Gilt Band... \$1.40'.

Address orders, specifying by its letter or number the frame desired, and inclosing price, as above, to the ORANGE JUDD COMPANY, 245 BROADWAY, NEW YORK.

GENUINE Peruvian Guano.

NEW YORK, SEPTEMBER 1ST, 1874.

I have the pleasure to inform the agricultural community, that the Special Agency established for the sale of Genuine Peruvian Guano, in small or large lots, at the same price at which it may be sold by Messrs. Hobson, Hurtado & Co., the sole Agents of the Peruvian Government in this country, has met with great success so far.

Verbal reports and numerous letters, received daily at this Agency, subject to the perusal of those interested, express entire satisfaction with the Guano sold by me last Spring. Farmers and country dealers are finding out that the Guano imported now, is as good as it was until adulterated by unscrupulous jobbers, in such a manner that many consumers were obliged to abandon its use. As, however, the knowledge of this Agency has spread, they are availing themselves of this opportunity to obtain again the genuine article.

By instructions of the Peruvian Government, their Agents here have advanced the price of Guanape Guano from this date to sixty-two dollars and fifty cents, (\$62.50) gold, per ton of 2240 lbs., gross, establishing at the same time a new scale of discounts, the lowest being of 50c. on parcels from 50 to 100 tons, and the highest \$4.00 on 500 tons and over. As usual, they will not sell in lots of less than ten tons.

Under this new arrangement I am enabled to fill orders for lots of ten tons and upwards, at less price than the Agents of the Peruvian Government. I will, as heretofore, supply quantities under ten tons at the same rate as charged by them.

Full particulars given in circular mailed free on application.

R. BALCAZAR,

P. O. Box 129. No. 53 Beaver Street, New York.

IMPORTANT TO INVENTORS.
American Agriculturist
PATENT DEPARTMENT

In compliance with the request of numerous inventors, we have organized a

PATENT DEPARTMENT
in connection with this office for the transaction of all business connected with

Securing Patents
in the United States and foreign countries.
The character for

Reliability
which has been maintained by the AMERICAN AGRICULTURIST for more than thirty years will be carefully guarded in this as in other departments.

All Inventors
desirous of procuring patents at moderate cost are invited to forward (express prepaid) a model of their invention, with a brief description of its working. The model should not exceed one cubic foot in dimension. Upon receipt of model an opinion as to patentability will be given free of charge.

Preliminary Examination
at the Patent Office, to determine patentability, will be promptly made for a fee of \$5.

Litigation of Patents.
The services of the best counsel have been secured to prosecute or protect before the U. S. Courts and the Patent Office the claims of those intrusting their business to this agency.
Specifications, drawings, engravings, models, and all other appliances furnished at moderate prices.

In all dealings with this Department inventors may depend upon promptness, fidelity to their interests, and the best services which can be rendered by thorough experts.
For full particulars, address

WANTED.—The United States Life Insurance Company is now re-organizing its Agency Department, and is prepared to negotiate with gentlemen of business ability to act as Agents. Previous connection with the business is not considered necessary.
Apply at the Home Office, 261 Broadway, New York. **JOHN E. DEWITT, President.**

FUN FOR THE MILLION.

For little folks and great folks ; for boys and girls, for young men and young women, for fathers and mothers, for grandfathers and grandmothers ; here it is, fun for all ! CRANDALL'S GREAT SHOW—THE ACROBATS. Have you had a box of them ? For a Toy it is one of the greatest inventions of the age. The central figure on this sheet gives the exact size of one of these Acrobats, when put together. The small figures, all about it, are simply suggestions of the almost numberless forms, that an ingenious boy or girl may make up with a single box of the Acrobats. It will be seen that the

central figure is in *seven different pieces*. A box of these Acrobats contains four bodies, four heads, eight arms, eight legs, one flag, and six pieces of wood, or thirty-one pieces in all, and yet from these few elements you can not only make pictures similar to those before you, but *many thousands* of others. The pieces are variously colored, which can not be shown in our ink engravings. They are so grooved and jointed and fitted, that they fasten strongly together in all conceivable positions. These amusing new toys are for sale by the toy dealers generally. They have delighted everybody, young or old, who has seen them. The ORANGE JUDD COMPANY are selling them at \$1 a box, at 245 Broadway, New York, or \$1.15, if sent by mail, pre-paid.

RICH FARMING LANDS

For Sale VERY CHEAP by the

UNION PACIFIC RAILROAD COMPANY

MILLIONS OF ACRES

IN THE

STATE OF NEBRASKA

AT PRICES RANGING FROM

\$2 to \$10 per Acre.

**FIVE AND TEN YEARS CREDIT GIVEN,
With Interest at Six per Cent.**

Convenient to Markets East and West.

The Lands of the Union Pacific Railroad Company are the odd numbered Sections for twenty miles on each side of the road. They are located in the valley of the Platte and its tributaries—a region widely celebrated for its beautiful scenery, rich productive soil, and mild and healthful climate. The winters are short, and the atmosphere dry and invigorating. Epidemic diseases are unknown. The surface is undulating, covered with nutritious grasses, and watered with numerous clear running streams. All the productions of the Eastern and Middle States are grown with success. Wheat and Corn are the staples, and it is well adapted to the cultivation of Fruit. For Stock-raising, in all its branches, these lands are unsurpassed. The Union Pacific and its branch railroads furnish market facilities unequalled. Education is free. One-eighteenth part of the entire area forms a permanent endowment of the Public Schools. Good Society, Schools, Churches, Post-Offices, Mills, Stores, and other advantages of civilization are enjoyed.

The liberal provisions made for Education, the freedom from State debt, the rapidity with which this section is settling, the numerous towns' and villages springing up, offering inducements to the merchant, farmer, and mechanic, render this tract a most desirable location for the industrious man of limited means to secure a comfortable home, and acquire competence, independence, and position.

These lands are granted directly to the Railroad Company. The title given to the purchaser is absolute, in fee simple, free from incumbrances.

They are sold in tracts of forty acres and upwards, giving the man of small means an equal chance with the capitalist to make a safe and profitable investment, one which can not be destroyed by fire or flood, a provision for future support, not affected by *revulsions*, or liable to the fluctuations of stocks.

Full information in reference to particular localities will be furnished, good lands selected, and sales made, free of charge, for persons not desiring to incur the expense of coming to examine the lands in person.

CHICAGO & NORTH-WESTERN RY. THE TRANS-CONTINENTAL ROUTE.

This is the Pioneer line between Chicago and the Pacific Coast, and was the first to connect with the great Pacific roads, and form the OVERLAND ROUTE. This line is the shortest rail line between Chicago and Omaha; the track is of the best steel rail, and is well ballasted, and as free from dust as a road can be made; the bridges are strong and durable; and all the appointments are first-class in every respect. The trains that run over this line are made up of elegant new Pullman Palace Drawing Room and Sleeping Coaches built expressly for this line, luxurious, well lighted and well ventilated Day Coaches, and pleasant lounging and smoking cars; all built by this Company in their own shops. The cars are all equipped with the celebrated Miller Safety Platform, and patent Buffers and Couplings, Westinghouse Safety Air Brakes, and every other appliance that has been devised for the safety of passenger trains. All trains are run by telegraph. In a word, this GREAT CALIFORNIA LINE has the best and smoothest track, and the most elegant and comfortable equipment of any road in the West; and has no superior in the country. It is eminently the favorite route with Chicagoans travelling west, and is acknowledged by the traveling public to be the popular line for all points in Western Iowa, Nebraska, Wyoming, Colorado, Utah, Montana, Idaho, Nevada, California, and the Pacific Slope.

All Coupon Ticket Agents sell tickets by this route. If you are going West, you should try this route.

What are English Channel Shoes?

Sewed shoes have the seam that unites the sole and upper snuck into a channel cut in the sole. Americans cut this channel from the edge of the sole and the thin lip turns up in wearing. The English channel, which never turns up, is cut from the surface, leaving a dark line when closed. As it cannot be cut in thin, poor leather, it indicates a good article.

Readily attached to any Stove. Introduced 8 Years. Thousands in Use. Once used, never dispensed with. Agents Wanted at once in valuable Territory. Circulars on application. American Manufacturing Co., 102 Orange St., NEW HAVEN, Conn.

INVENTORS Who wish to secure PATENTS should write to MUNN & CO., 37 Park Row, New York, for Advice and Pamphlet, 103 pages, FREE.

THE ROADS IN WINTER. — USE OF THE SNOW PLOW. — Drawn and Engraved for the American Agriculturist

We could never understand why it is, that in those parts of the country where deep snows prevail, some efforts are not made by the town authorities to keep good roads during the winter. In the spring and summer the roads are repaired, and some efforts are made to keep them passable. But when the first heavy snow of the season falls, and on every similar occasion afterwards, it is the business of those who are compelled to go out first to break the roads, and those who can wait, do so until others have made the roads passable. Then a narrow single track is made, along which only one

team at a time can pass, and if two meet, one must turn out into the deep snow, at the risk of upsetting on the piled-up bank, or in a convenient ditch. Such, at least, has been our experience, and to remedy this inconvenience, we have often turned out with a snow-plow, to do individually, what ought to have been the road-master's work, or at least that of the associated neighbors. At such times we have improved on the usual plan, by making double tracks, thus rendering turning out in the snow for passing teams unnecessary. The snow-plow used for this purpose is shown in the illustra-

tion given in this article. It should be loaded as heavily as possible, and two pairs of horses should be used with it, so that the snow will be packed down firmly, and a well-beaten track made. Breaking roads in the snow is always a favorite job with the boys, and volunteers are never wanting. The chief thing is to procure the plow. As we have suggested, this should be provided by the road-master of each district, whose business it should be to turn out with it after each heavy fall of snow, and clear the roads. A description of the manner of making the plow will be found on page 412.

AMERICAN AGRICULTURIST.

NEW YORK, NOVEMBER, 1874.

At the present time the course of the markets is closely studied. When to sell, is a serious question with farmers. Hitherto they have frequently had the mortification to see their grain pass from their hands at low prices, which have been brought about by combinations of speculators and dealers. These persons, as soon as they had secured the grain, have put up prices and cleared millions of dollars, which by right ought to have gone to the farmers' pockets. At the present time the market has been influenced by false reports of enormous crops in Europe, and grain has been sold for delivery several months ahead, at prices which will not pay the cost of raising it. The London Mark Lane Express, speaks of "low stocks at present with no room for decline, and that every exporting country complains bitterly of English rates." This means higher prices, and if grain is not forced on the markets, we do not see how they can be prevented. Fortunately farmers are becoming better able to act in their own defence, and having learned to combine for this purpose, may set their own price on their products, and demand the fair value for their labor. Some commercial papers pretend that this is an improper thing to do; that it is next to criminal for farmers to set a price upon the world's food. That they should sell at the earliest moment their grain is ready for market, and take the current price for it. But what other producers do this? None. All other producers fix their prices, and hold their produce for them as long as they are able. And this the farmer has a right to do. No other man may fix the price for the farmer's labor. To do that is his own personal privilege. But to be able to watch his own interests closely, and protect his privileges, the farmer must keep "posted." He must be a reading man. It is by reading, more than by practical experience, that men become educated; and a man's education is not finished while he lives. One's own experience is narrow. When one reads, he gathers the accumulated experience of hundreds or thousands. The farmer therefore must read papers. His local paper, as a matter of course, should be read, because every farmer should interest himself in his own local affairs, and make his weight felt socially and politically. This is his duty to himself and to his neighbors. But in addition, he should read

some paper in which he may get a general view of affairs in which he has an interest. The American Agriculturist located in a central point, with editors and contributors who are engaged in agriculture in widely distant parts of the country, has the best facilities for giving a general view of agricultural matters of the greatest value to farmers everywhere. It enters into no competition with local papers, but acts with and for them. And it is only as far as farmers read and study the best papers more and more, that they will be enabled to act in concert with each other, understandingly and effectively. In union is strength, but that strength is useful only as it is wisely used.

Hints about Work.

The first work to be done, is to attend to the comfort of the farm stock, neglecting none. Probably these have been neglected in the hurry of harvesting and storing crops. They should now be looked to. Every loose board upon the stables and sheds should be tightly nailed, the open cracks should be battened, openings in the caves should be closed, windows and roofs repaired, broken floors made sound, and some extra feed provided. If fodder is short, it is economy to keep the stock warm and dry, and feed liberally before severe weather comes. Animals in good condition, will be able to stand some hardship in the spring, and come out better than those that are stunted now, and given extra care then. It is a difficult matter to bring up poor stock when spring is coming on.

Horses.—Provide blankets for the horses. A warm blanket will save feed and loss of time by sickness. Avoid exposure to cold rains, and if caught in a storm, let the horses be rubbed dry before the blankets are put over them. Keep the stalls clean, and on no account allow manure to gather beneath the horses' feet. This injures the hoofs, and often produces cracked heels. Besides, it renders the air foul, and is very injurious to the animals' eyes. In the effort to keep the stable warm, proper ventilation should not be neglected. The curry comb and brush should not lie idle; their use invigorates the skin, and promotes healthful secretions.

Cows.—Milking cows will now need extra feed. On the whole, more value in milk will be returned from bran than from any other feed—not the light husks, but what is known as bran at country mills. A winter dairy well managed, may be made more profitable than a summer one. Dry cows should be kept in good condition. They are now storing up material for future profit. The future value of the calf too, depends upon how the dam is fed before its birth. Bran is excellent feed for in-calf cows, and it is cheap now. It is well not to waste time in milking cows that give only a quart a day, but it will be better to dry them off.

Young Stock.—All young animals need liberal and kindly treatment, and watchful care. The farmer's eye should ever be on the alert to discover the first sign of disorder, and when found, it should be remedied at once.

Sheep.—No stock suffer more from damp close quarters, than sheep. They will winter better in the open field, than in a low damp filthy yard. But they should be spared either of these afflictions. An open shed that may be closed in driving storms ought to be provided, with a roomy yard in which they may lie in fair weather. Oats and corn are both dear this season, and bran, rye, or buckwheat, may be given with equal profit. A little variation of feed is good for sheep, but the changes should not be made frequently, or they will learn to look for it and become dissatisfied. Frozen grass or any cold watery feed is bad for ewes that are to lamb early.

Breeding Ewes, to lamb in April, should be put with the ram this month. From this time their feed should be gradually increased.

Lambs, and yearling ewes that are not to be bred from, may be put together and kept separate from the other sheep. If any of the flocks have the scours, a table-spoonful of a mixture of prepared

To Purify a Cistern.—"D. L. B." Morrisania, N. Y. The best plan, probably, to purify the water in a cistern is to put into it a basket, net, or sack, containing a bushel of fresh charcoal. If there is a filter in the cistern, it should be taken out and cleansed.

chalk and peppermint in water, should be given once a day. Costiveness is quickly remedied by a little linseed oil-cake meal.

Swine.—Fat hogs should be finished up as fast as possible. Those intended for home use, should be finished upon dry shelled corn, with pure water only for drink. This will produce firm hard pork. Store hogs will do best upon cooked food, and in place of corn, boiled potatoes and bran will make excellent feed. Buckwheat is too heating food for pigs, and should be avoided. Brood sows may have the company of the boar, if pigs are wanted in March. The increased value of the first litter of pigs, will pay for a pure bred boar. Nothing is more certain than that it pays to breed only from pure blooded males, of whatever kind or breed they may be. But blood will not stand in place of feed. Blooded pigs are most profitable and thrive best where there is a full corn crib.

Storing Roots.—Root crops and potatoes should be stored in dry pits, in preference to cellars beneath the house. Ventilation should not be neglected; wisps of straw should be placed in the tops of the pits every six feet apart, for this purpose. If any are still in the ground, they should be harvested without delay. A good substantial and permanent root house in a convenient place, will be found valuable.

Roads.—Repairing roads should not be put off any later. Every farm should have a permanent road through the center, which should be kept in good repair. Roadmasters should see that mud-holes and bad spots in the roads are filled with broken stone. Mending roads with earth at any season, is waste labor. There should be a Blake's Stone Crusher at every country mill where road material can be procured. One year's use would pay for it. In nothing are we so behind the times as in the condition of our country roads.

Sundry Matters.—Upon stormy days there will be found plenty of occupation in repairing harness, cleaning and putting away tools, working in the carpenter's shop, repairing grain bags, etc. Such work is recreation. As this is the season for selling poultry, let there be a good supply kept for home use, and those which are kept for breeding, should be well cared for, so that they may lay early. The poultry house should be kept clean and well white-washed, if it has not been already done. Keep the plow running in the corn stubbles until the ground is frozen. The long winter evenings should be devoted to study and domestic entertainments; in which the younger should be joined by the older ones. There are few things which will more readily make farm life agreeable to children, than the pleasant evenings which may be spent in a farm house, with books, papers, toys, and games, in which the old folks renew their youth again. It is the want of this companionship, which makes country life so generally dull and uninviting to young people.

Work in the Horticultural Departments.

If advantage was taken of the pleasant October, gardening operations will be pretty well advanced by the first of this month. Do not delay any work which must be done before hard frosts set in, because November weather is very deceptive, and a change from mild to freezing temperature, is often only a matter of a few hours. The gardener should have learned something new about his business if he has had his eyes open, as all intelligent men should have, and another year ought to find him advanced both in the science and art of gardening. No horticulturist should be content to plod on in the same path year after year, raising the same crops, and pursuing the same hum-drum sort of life; on the contrary, he should strike out into new paths, try new varieties of seeds and plants as far as his means will allow, and so put the energy and talent into his work that business men do into their's. We should then hear less of boys leaving their homes for the city, where 95 out of every 100 fail in business. Papers and books should be provided for the long winter evenings.

Orchard and Nursery.

Planting may often be done this month where the weather is mild, but on no account set the trees in partially frozen soil; it is much better to heel-in the trees in a dry sandy spot until spring, when they can be set out properly.

Stocks for root grafting should be taken up, assorted, and tied in bundles of convenient size, and stored in boxes of damp sawdust in the cellar, where they can be easily reached during the winter.

Cions may be cut at any time when the wood is not frozen; store in saw-dust, and take care that they do not dry out during the winter.

Seedlings.—Give protection, but not until the weather is quite cold; if applied too early, growth sometimes occurs.

Leaves.—Collect and store as large a supply of these as possible, for covering and bedding; see article on gathering them, on page 416.

Fruit should be kept in rooms or cellars where the temperature is as even as possible, the nearer it is to 35° or 40° the better will the fruit keep.

Plowing.—All plowing should be done early this month; ground for new orchards will be in much better condition for planting, if plowed in the fall.

Fruit Garden.

Pears of choice varieties well preserved, will now bring good prices in the markets. If packed in shallow boxes, containing one or two layers, and each pear wrapped in soft tissue paper, the extra price will more than repay the trouble.

Covering.—Try to cover strawberries, etc., just as freezing weather sets in; this is easily done if the covering material is at hand. Young grape vines are best covered with a few inches of earth.

Root Cuttings.—Blackberries and raspberries are most readily propagated from root cuttings. The roots are cut into pieces two or three inches long, and packed closely in a box with earth; there should be holes in the bottom of the box to allow of drainage, then bury the box and contents in a dry spot, and leave until spring.

Cuttings of currants and gooseberries may be planted. The one thing necessary to insure success, is that the earth be packed firmly around the base of the cuttings.

Grape Vines.—Prune at once before cold weather sets in, many persons do not prune until spring; if left until then, the vines are liable to bleed. The various methods of pruning have been described, and it makes but little difference which is adopted.

Grape Cuttings.—The wood from the pruning of the grape vines, may be used for propagation. Cut into pieces containing two buds, and tie into convenient bundles, and bury in sand in the cellar. Varieties hard to start, like the Delaware, should be rooted in the greenhouse or hot-bed from one-eye cuttings, while others, like Norton's Virginia, can only be profitably multiplied by layers.

Kitchen Garden.

In the more Northern localities, but little can be done in the garden this month, except plowing and hauling out manure. All land not planted, should be plowed or spaded in the fall if possible, as it can be much sooner worked in the spring.

Asparagus.—Cover the beds with a good dressing of coarse manure, straw or litter. Burn the seeds if they are not wanted for new plantings.

Roots.—Place in pits as recommended for last month, but do not cover with earth until the weather renders it necessary. The hardier roots, such as parsnips, salsify, horseradish, etc., may be dug as long as the ground remains unfrozen.

Manure is the basis of good crops in the garden, and most farmers would be surprised at the quantity applied to an acre by our market gardeners. Every method should be used to increase the supply. Gather leaves, woods' earth, swamp muck, to be used as absorbents for the liquid manure of the stables or the house slops; sods and loam should be carted to the barn-yard, for use in the stables.

Rhubarb.—Transplant now, rather than in the spring. Give an abundance of manure.

Cold Frames should be ready for cabbages and other plants wintered over. Do not cover until freezing weather comes, and then only put on the sashes at night.

Celery.—Store in trenches a foot wide, and as deep as necessary to contain the plants. Put the roots close together and cover with straw, gradually increasing the thickness as the cold increases.

Cabbages.—The best way to preserve these, is to invert the heads and cover with four to six inches of earth; this should be left as late as the earth can be worked.

Spinach.—Give a slight covering of leaves or hay, just as the ground begins to freeze.

Soil.—Prepare a quantity of this for use in the hot-beds next spring. It is usually difficult to get soil at that time, and it is much better to have a supply ready for use, stored under a shed or in the cellar. A light sandy loam is best, and if too heavy, mix a third part of sand with it, and add a little well rotted manure. The whole pile should be thoroughly mixed, and placed in a heap under cover.

Flower Garden and Lawn.

There is but little to add to our notes of last month, in this department. Everything should be done to help along the work of the coming spring.

Planting of many things can be done this month as well as in the spring, as long as the ground remains open. Trees and shrubs may be moved readily now, and many kinds which start early, are better transplanted now than in the spring.

Bulbs.—If not planted last month, do not delay doing it at once. Take up Gladioluses and other tender bulbs. Cover all bulb beds with a coating of straw or leaves.

Protection.—Give some protection to all half-hardy plants, and even herbaceous plants that are quite hardy, are greatly benefitted by a slight protection.

Lawns.—If the grass shows signs of failing, apply a dressing of fine, well rotted manure. Where the grass has died out, sow fresh seed, and rake it in smoothly and evenly.

Perennials.—It is not yet too late to divide and replant old plants.

Greenhouse and Window Plants.

Insects.—Look out that no plants are put into the greenhouse which are covered with insects; the only way to keep the house free, is never to let them get in.

Bulbs potted and placed in the cellar, may be brought out from time to time, if they have made good roots.

Camellias.—Keep the plants in a cool room, where they can develop their buds properly. Syringe often to keep the foliage healthy.

Propagate such plants as it is desirable to have for winter blooming, or for setting out, or for sale in the spring.

Climbers are necessary in a greenhouse to provide shade for the other plants. Passifloras, Roses, Tropæolums, etc., are all valuable for this purpose.

Annuals.—Sow seeds of a few free flowering ones for winter flowers. Sweet Alyssum and Mignonette are good bouquet plants.

Lobelias.—If the low growing sorts were planted in the flower-garden during the summer, a portion should be taken up for planting in pots or pans for winter flowering.

Ferns are liable to become infested with red-spider and scale, and if they are not watched closely they will soon perish, at least the more tender sorts. This month is a good time to divide such plants as are capable of division.

Forcing.—Provide plants of Dicentra, Candytuft, Deutzia, and other plants desired for winter flowering, and store in the cellar.

Commercial Matters—Market Prices.

The following condensed, comprehensive tables, carefully prepared specially for the American Agriculturist, from our daily record during the year, show at a glance the transactions for the month ending Oct. 13th, 1874, and for the corresponding month last year:

TRANSACTIONS AT THE NEW YORK MARKETS. RECEIPTS. Flour, Wheat, Corn, Rye, Barley, Oats. 25 d's this m'th 3,331,000 3,214,000 1,711,000 103,000 117,000 802,000 25 d's last m'th 3,619,000 3,571,000 1,977,000 54,000 28,700 738,000 SALES. Flour, Wheat, Corn, Rye, Barley, Oats. 25 d's this m'th 3,037,000 4,807,000 4,218,000 48,000 129,000 1,911,000 25 d's last m'th 3,818,000 5,143,000 4,716,000 26,000 86,000 2,304,000

CURRENT WHOLESALE PRICES.

Table of current wholesale prices for various commodities including Flour, Wheat, Corn, Rye, Barley, Oats, and other agricultural products. Columns include item names and prices for different months (Sept. 12, Oct. 13).

considerable speculative inquiry, closing buoyantly. An unusually free movement has been recently in progress in Oats, in good part for forward delivery, at advancing figures... The Provision trade closes up rather tamely and heavily, the speculative demand having fallen off materially... Cotton has been more freely dealt in, but at reduced quotations, closing, however, more steadily... Wool has been in less confident demand, and at the close somewhat less firm in price... Tobacco has been in lively request at higher rates... Hops have been active and firm, the main inquiry having been on export account... Seeds have been rather more sought after on the basis of our quotations... Hay and Straw have been attracting more attention, closing more firmly.

New York Live-Stock Markets.

Table showing receipts for live stock markets including Beef Cows, Calves, Sheep, and Swine. Columns include week ending, receipts, and average prices.

Beef Cattle.—At the opening of the month's business the inferior quality of the offerings made a dull market, although no appreciable falling off in prices could be marked. A repetition of this the next week tended to lower the market, and a fall of fully 1/2 c. per lb. had to be submitted to. The market continued to be overburdened with poor cattle, and sales were made at 6 cents against 7 cents for the poorest at this time last year. To do a losing business did not suit the views of dealers, and 20 cars of Texans were held back at Harrisburg. This helped to raise the average greatly, and with some of the best extra cattle of the season the market was lively, but prices were not notably better. At the close native steers ranged from 8 1/2 c. @ 12 lb., to dress 55 lbs., up to 13c., to dress 58 lbs. A few of the finest sold up to 13 1/2 c., to dress 58 lbs. Texans and Cherokees brought 6 1/2 @ 8 c. @ 12 lb., to dress 54 @ 55 lbs., and 9 1/2 c., to dress 55 @ 56 lbs. to the gross cwt. A year ago we had the largest receipts of the season, and prices fell off 1 c. @ 12 lb., the best steers selling at 12 to 12 1/2 c. @ 12 lb.

The prices for the past four weeks were as follows:

Table showing prices for the past four weeks for Milk Cows, Large Sales, and Average prices.

Milk Cows.—There has been a good demand for cows all through the past month, which, with light receipts, put up prices at least \$5 per head. Fancy cows have been in demand, and a car-load from Ontario Co., N. Y., brought from \$75 to \$129.50 per head. Sales have been at \$50 @ \$80 for fair cows, calf included, and \$100 and \$129.50 for two extra fancy cows... Calves.—The market for calves has gradually dulled through the month, and closes duller than before, without much change in prices however. Milk-fed veals are selling at 7 to 10 c. @ 12 lb., and grassers at \$5 to \$10 per head....

Sheep and Lambs.—Sheep have been steady and lambs active through the past month. Prices have been firm, with an advance for lambs. At the close sheep ranged from 4 1/2 @ 6 1/2 c. @ 12 lb., and lambs sold at 6 1/2 c. to 8 1/2 c. @ 12 lb.... Swine.—A large business has been done in hogs, with a weekly average of 10,000 head over last month. Prices have fallen off, and at the close sales were made at 5 1/2 @ 6 1/2 c. @ 12 lb., and 8 1/4 @ 8 1/2 c. for dressed.

The Texas Cattle Disease.—In Several parts of Connecticut and in Lewistown, Pennsylvania, many cattle have died of late of what is known as the Texas cattle disease. Not that Texas cattle die of this disease, but that those native cattle, which are pastured along with or after Texas or Cherokee cattle, are seized and die with it. The disease is very similar to that well known as "splenic apoplexy," and consists in a general disorganization of the blood, and congestion of the spleen and kidneys. The bladder is also filled with a dark, blood-like fluid. The infected cattle are covered with cattle ticks, which is sufficient to show that they had been brought into contact with Texas cattle. In the case which occurred in Pennsylvania, which was described to us by one of the persons interested, it was wrongly supposed that the presence of the ticks in the stomach and intestines (and as was also stated in the kidneys) was the cause of death. That the ticks were found in the intestines simply shows that the animals, in licking themselves to get rid of these tormentors, had swallowed many of them. But they have no serious effect, if any at all, upon the animal when swallowed. In the kidney, which was sent to us and which we examined, there was nothing more than the usual dark-colored congested patches, the small hard nodules supposed to be ticks, or caused by ticks, were merely small calculi or stones,

which are so frequently found in the kidneys of cattle. There is nothing new in these cases. Thousands of similar ones have occurred in the West, and the precaution of avoiding contact with Texas or Cherokee cattle is sufficient to prevent the disease. Neither is there so great an anomaly as is supposed in the fact that other cattle die of this disease, which is not fatal to a Texas steer. That animal is acclimated, and is therefore exempt from the fatal effects of the disorder to which others at once fall victims. The disease is probably communicated by means of the urine, dung, or saliva, of the Texans upon the pasture, which is picked up by the animals which feed with them or after them. There is no readier means of conveying infection than these. If this disease is to be shut out from the Eastern States, the precautions observed in the West must be adopted, viz.: prohibiting the driving of Texas cattle upon the public roads, or pasturing them in fields except in those months when frost is frequent. The infection is destroyed by a freezing temperature. As prevention is so perfectly safe, it is useless to prescribe any doubtful remedies, the more so, as the first intimation that the disease is present, is the death of the infected animals in almost every case. We learn that Prof. Crossy, of the Massachusetts Agricultural College, along with the Hon. T. S. Gold and E. H. Hyde, the State Commissioners of Diseases of Domestic Animals of Connecticut, have made some investigations, but these have resulted in no new developments, and no fresh light has been thrown upon the question of the causes or treatment of the disease.

Something Worth Looking Into By Every One. See Page 433.

containing a great variety of items, including many good hints and suggestions which we throw into smaller type and condensed form, for want of space elsewhere.

Remitting Money: — Checks on New York City Banks or Bankers are best for large sums; make payable to the order of Orange Judd Company. Post-Office Money Orders for \$50 or less, are cheap and safe also. When these are not obtainable, register letters, affixing stamps for postage and registry; put in the money and seal the letter in the presence of the postmaster, and take his receipt for it. Money sent in the above three methods is safe against loss.

N.B.—The New Postage Law.

—On account of the new postal law, which requires pre-payment of postage by the publishers, after January 1st, 1875, each subscriber, whose subscription runs over into the next year, must remit, in addition to the regular rates, one cent for each month over which his subscription extends in 1875, or ten cents for the whole year 1875. Every subscriber, whether coming singly, or in clubs at club rates, will be particular to send to this office postage as above, that is, at the rate of ten cents for the year, additional to the regular subscription. Subscribers in British America will continue to send postage as heretofore, for pre-payment here.

Bound Copies of Volume Thirty-two are now ready. Price, \$2, at our office; or \$2.50 each, if sent by mail. Any of the last seventeen volumes (16 to 32) will also be forwarded at same price. Sets of numbers sent to our office will be neatly bound in our regular style, at 75 cents per vol. (50 cents extra, if returned by mail.) Missing numbers supplied at 12 cents each.

Subscribe this month, and get the December Number FREE. Read "A Bit of History," and "The Result" on p. 433 and following pp.

Gold has been up to 110%, and down to 109 1/2, closing October 12th at 110 1/2, as against 109 1/2 on September 12th... Business in most kinds of domestic produce, has been comparatively brisk, but at irregular and quite generally lower prices. The Breadstuff trade has been on an extensive scale, with the purchases of Wheat, Corn, and Flour, largely on export account, at, however, unsettled rates, closing generally rather in favor of buyers, notwithstanding the lighter arrivals, or the lower range of ocean freights. Rye has been more sought after toward the close, partly for shipment, and has been quoted firmer. Barley has also been more active, with

Our Western Office.—Our friends in the West are reminded that we have an office at Lakeside Building, Chicago, Ill., in charge of Mr. W. H. Busbey. Subscriptions to *American Agriculturist* are taken there, and sample copies of the paper and chromo are delivered, and orders received for advertising on the same terms as in New York. All our books are on sale at the Western Office. Please call and examine, buy, subscribe, and advertise.

The American Agriculturist in German.—We ask the kind attention of our readers to the fact that this paper is also printed in *German*. Many of them may have friends, or neighbors, or working men of that nationality, who would be glad to secure such a Journal as this. The more important articles and the same illustrations are contained in the German edition, with a Special German Department by Hon. Frederick Münch, of Missouri, and the rates, single and club, are the same as for the English edition.

Delayed Replies.—"C. G. M. B.," Detroit, Mich. Letters of inquiry that may be received after the 10th of any month can not be replied to in the next month's *Agriculturist*, and have to lie over until the second month. This is one of the necessities in the publication of a monthly paper, and we request our friends to remember that there are other unavoidable exigencies that will prevent immediate replies to their queries. Important matters, *as far as possible*, will be answered by mail; the most important have the preference.

To Advertisers and Readers.—There is no doubt that the columns of the *American Agriculturist* furnish by far the best general medium for advertising anywhere to be found, and for several reasons: It is universally conceded by advertising agents that no other Journal is so absolutely strict in shutting out any and all advertisements and advertisers of an unreliable character, and those in any way objectionable, such as medical, etc. If the rules in this respect were let down for a single year, it would bring a hundred thousand dollars to the publishers, as the class shut out—those who give the least, or nothing, or worse than nothing, for the money they receive, can and do pay the best prices and largest sums for advertising. . . . Many advertisers ask for an editorial "notice" or reference. It should be understood that the advertising pages are *edited*, and the admission of an advertisement at all, is as good as an editorial endorsement in other papers. . . . The immense bona-fide circulation, the permanent character of the paper, each number of which is before the reader for a whole month, and very often for years, is another valuable feature. The fact that this paper is largely loaned or exchanged among neighbors, so that very often 20 to 30 adult persons read a single copy, is another element. If a loose card of 20 lines were to be sent with each copy of the paper, it would cost many times as much to barely print it, as it now costs to electotype such a card permanently in the pages where it will not fall out, and where it will be seen by every reader.—OUR READERS will always be profited by looking through our business pages to learn what is for sale, by whom, etc. Many good suggestions are thus received by those who do not want to buy anything.—We respectfully suggest that when our readers write to any of our advertisers for circulars, or to order of them, or make inquiries, they will let them know that the advertisements were seen in this Journal. It will be of triple advantage—to themselves, to advertisers, and to the publishers.

A Competent Gardener, will change his situation next spring. We refer to Mr. Louis Guerinneau, who has for several years been the gardener at the Botanic Garden, Cambridge, Mass., during which time, as well as before, we have had frequent occasion to know of his ability in his profession. Besides being proficient in gardening in all its departments, Mr. G. has a knowledge of botany rarely to be found associated with ability as a practical gardener, and would be most valuable to an Agricultural College, where there is a botanic garden, or in any similar situation. Mr. G. may be addressed as above, and has permission to refer to the Editor of the *Agriculturist*.

What is a Good Pump?—G. Timson. Our own experience in the matter of pumps for an ordinary well is very limited, but such as it we give it. Having concluded to put in a pump early this spring, the next point was to decide upon the kind. Knowing that our next neighbor had a pump in use for some two years, and that another about a mile off had upon his place two pumps of the same kind, which he had used much to his satisfaction for some four years, we concluded it would be well to profit by their experience, and get a similar pump, which was the American Submerged. This was put in early this spring, and has been in daily use ever

since, and certainly for ease of working, and for power, it is not easy to conceive of a more satisfactory well pump. By attaching a hose, a good stream of water can be thrown upon the house, but we hope not to be obliged to test its utility as a force-pump for any other work than washing carriages. The pump itself being below the surface of the water, cannot freeze up, and the pipes used are enamelled upon the inside and outside with a coating upon which, it is claimed—and we think with good reason, that neither water, or any other liquid, has any action. So, combining our own experience with that of our neighbors, we have no hesitation in saying that the American Submerged is a "good pump."

Don't fail to Read the Premium List, see pages 433 to 437.

A Farmer's Book.—"W. A. G.," Highlands, N. J. Allen's new American Farm Book, price \$2.50, would be a very suitable book for a young man to study, who wants to learn farming. It may be procured at this office by remitting the price.

Death of an Editor.—Mr. John S. Wright, the founder of the *Prairie Farmer*, and one of the early settlers of Chicago, died recently at the age of 59. The Chicago papers speak in high terms of his personal qualities, as well as of his great influence in making that city what it now is. He ceased his active editorial duties in 1857 or '58.

Orange Culture in Florida.—A series of letters that were written by J. H. Fowler, of Port Orange, and printed in the *Florida Agriculturist*, has been published by C. H. Walton & Co., in a pamphlet form. We read the letters as they appeared, and have no doubt that this will prove a useful as it is the only work on Orange Culture yet published in the country. Price 25 cents.

Death of Mr. Bloomer.—A private letter from one of his associates informs us that Mr. H. G. Bloomer died at San Francisco late in September last. Mr. B. did much to develop the botany of California, and is commemorated in a genus, as well as several species, among which is *Lilium Bloomerianum*. At the time of his death Mr. B. was Curator of the California Academy of Natural Sciences.

Asbestos Roofing.—"G. T." We have Johns' Roofing in use, it has been on about two years, but not long enough for us to say how many years it will last. Thus far we are quite satisfied with it, and though we have advertised it from the beginning, we have not yet received a single complaint.

The Schoolmaster's Trunk.—This is a reproduction of a series of articles written a year or more ago for *Heath and Home*, by Mrs. A. B. Diaz, published by J. R. Osgood & Co. Every one who lives in a village, as well as every one who does not, will find amusement here, and more than that, abundant food for thought. It is rare that the relations of neighbors, and the "rights" of women are touched by so clever a hand. We read the papers as they appeared, and again in the volume, which is as high a compliment as we can pay to any work. Read it, and see if *Tweentit* is the only place where the rolling pin is making slaves.

SUNDRY HUMBUGS.—The changes, which the times and seasons bring to our humbug budget, have been before alluded to, and it is very often the case that we will receive from widely separated parts of the country, a number of reports of a similar character, all written within a few days of one another. This month the prevailing trouble comes from the doings of

TREE PEDDLERS OR NURSERY AGENTS,

and though we have often warned our readers against these fellows, it is necessary in this, as in other cases, to reiterate. One of the most astonishing things that falls under our observation, is the shortness of memory which prevails. In the budget now before us, we have a letter complaining of a "puzzle-picture, called the Toll-gate," and others asking about Mulligan and his sewing machines. The "Toll-gate" was shown up in September, and the sewing machines any time the past four months. So with nursery agents, and horticultural quacks of all kinds, we have had so much to say about these, that one would suppose that every reader would be on his guard. The nursery agent matter is a difficult one to handle, from the fact that the nurserymen do not pursue a uniform course. While some do not send out any traveling agents whatever, others, and equally respectable ones, do employ agents. On some accounts a traveling agent, provided he really be an agent, is of use, as there are many who will purchase fruit trees upon ner-

sonal application, who would not otherwise do so, and no doubt there is much more fruit grown through their influence, than there would otherwise have been. Could the matter stop here, no one would complain; but agents of this kind are the exception, while those of quite another kind are the rule—and this other kind are a set of liars and swindlers. The outfit required by one of these "agents," is principally an unbounded supply of brass, a glib tongue, an impossibility to understand what the word "no" means, and a power of holding on until the customer is thoroughly tired out, and orders something, to get rid of the chap. In addition to these personal qualifications, he needs a book of colored plates, in which fruits are caricatured as to size and color, and perhaps some bottles containing large currants and other fruits in spirits. This agent goes around in summer for orders to be delivered in fall, and in winter for those to be delivered in spring. When it is near time to deliver his goods, he goes to the large nursery centers, and buys up the refuse stock, such as no respectable establishment would send to its regular customers; all the poorly grown, badly shaped, and "hospital stock" is bought up, and either labeled and assorted there, or sent in a lump to some point central to his customers, there to be used in filling his orders. Of course, the labels on the trees will agree with the names on the order, but that they shall have any reference to the kind of the tree, is of but little consequence. The fraud can not be found out for several years, and the dealer will then be far enough away. All this is bad enough, but these swindlers offer, with vivid descriptions, things which really have no existence, or represent old and worthless varieties as something rare. Of late we have heard much of the selling of the Bush Alpine Strawberry, a new kind, in which the strawberries grow on bushes, and the plants have no runners. The Bush Alpines are among the oldest of strawberries, and there is no bush about them, but their flower-stalks stand erect, while the fruit is to most persons very indifferent. This plant, over two centuries in cultivation, has been sold all over the country the past season as a novelty, and at high prices. One chap has been in Missouri, and other Western States, taking orders for "self-pruning" grape vines; another has gooseberries that are "never sour"—and ornamental peaches "in clusters," giving the purchaser to think it is the fruit that is in clusters, and not informing him, that if an ornamental peach tree should produce fruit at all, it would be worthless. If people would take the trouble to inform themselves about such matters, they could not be imposed upon. It is beyond our comprehension, that any one can be found to believe in such absurdities, as "self-pruning" grape vines—why not self-planting as well? Our advice is, as it always has been, not to buy of agents at all. Send to some respectable nursery (see our advertising columns) for a catalogue, select mainly such fruits as you know, or can learn, to have succeeded in your locality, add such kinds as you would like to try, and send the order direct to the nursery. The freight on a single lot will be a little more in proportion, than on the agent's larger lot, but the certainty of having the kinds that were ordered, more than offsets this. But if one from circumstances must buy from agents, have nothing to do with any one who can not show a recent certificate from a well-known nursery. It is a dodge that agents guarantee to deliver trees from such or such a nursery—but that is no certificate. If any agent or tree peddler offers any unusual novelty—something out of the ordinary way that no one else has, or that has only just been introduced—have nothing to do with him. Such things do not get into the hands of peddlers. Every novelty in fruits and flowers worth having, gets talked of and described in the papers long before it becomes common enough to be sold by these fellows.

SUSPICIOUS SMALL FRUIT DOINGS.

Complaints come to us in regard to one Ohio Small Fruit dealer, whose name is Norris, and these, together with what we can learn from those who know the man and his operations, lead us to advise our readers to be cautious in their dealings with Ohio small fruit farmers of the above name who make a tremendous show with highly ornamental letter heads.

A NICE LITTLE DODGE FOR GETTING NAMES.

Many good people who receive circulars of quack medicines and other things, wonder how the senders could have obtained their names. We have in former numbers explained some of the means resorted to, and stated that lists of addresses were bought and sold like other merchandise. A circular is being forwarded to the officers of various temperance lodges and other associations; it is printed on the back of two specimen pages of a *Temperance Almanac*, which the signers say they are getting up; it asks for statistics about the lodge, its officers, etc., etc., and then adds: "also please send us the names and address of all the members of your lodge, if you have them in print, and if not in print, please give us the names of one or more officers or

members, who would arrange with us to get them up and send them to us." Now this may all be legitimate, and there may be a temperance almanac on foot, but the funny thing about it is, that one of the "specimen pages" is the exact reproduction of a page in a Bitters' man's pamphlet, and the circular is signed with name and number in New York, while the Bitters' thing is signed with another name but at the same number! It all looks very much like a dodge to get names for the Bitters' establishment.

WAR CLAIM SWINDLE.

One of our correspondents in Louisiana, writes that one Capt. Hawk, is going about representing that the Government had made an appropriation to pay the Southerners for property lost during the war, and that he would collect the claims on shares; but as a "condition precedent," he asks each planter for a fee of \$2. "In the vicinity of our town he collected over \$500." Poor chickens of planters, you will know a Hawk the next time you see him!

ANOTHER HARD CASE

is brought to our notice by a lady who sent money to a dealer in Chambersburg, Pa., for eggs, which among other things he advertises. The lady received no eggs, and can neither get her money back nor any reply to her letters. That the man received the money, is shown by the return of the check endorsed by him. It is just one of those cases in which there may be an explanation possible, and all we can do under the circumstances, is to advise the lady to enter a suit for obtaining money under false pretenses.

AND NOW IT IS TOPEKA, KANSAS,

that has a lottery. She does not go for a library like Kentucky, nor yet for a school house, like Nebraska, but for what we always have with us—the poor. It is a grand scheme, \$65,000 of tickets are to be sold, \$55,000 of "gifts" are to be distributed, and if all goes lovely, the poor of Topeka will get \$10,000, and the disinterested Mr. Haywood, who goes through all the trouble, gets nothing—Stop though, \$20,000 of the prizes are in furniture, and it looks very much as if here was a dodge for closing out a slow stock of bedsteads, rocking-chairs, washstands, and the like. Here is an out and out lottery sanctioned by the mayor, all for the chance of getting at the most \$10,000 for the poor! Isn't this selling the moral status of Topeka at a rather cheap rate? . . . It has long passed into a proverb, that there is no

ROYAL ROAD TO LEARNING,

but there is, or very soon will be, for a man in Philadelphia is grading and fixing it up generally, and it is all to be in a book of 100 pages. It is to be called the "Royal Road to Learning, or The Finger-Post to Knowledge." Now how a thing can be both a "road" and a "finger-post" at the same time, seems to us as a little mixed, and would, we believe, puzzle a Philadelphia lawyer. About this road we learn that its size is to be "8x10 inches," but for the rest it is all a muddle. We learn that "disavowing the present brain dulling memorizing of words and lessons, together with ideas, thoughts, and other knowledge, where, in the attempt to grasp the perplexing shadows, the substance is too often lost," yes, "jess so."

COUNTERFEIT MONEY.

After a dreary repetition of the old circulars that were sent out under scores of different names, it is a change to turn to the spick span new one, all in handsome script in the blackest of lithographic ink. And there is no nonsense about it. It offers counterfeit money right out, in lots to suit customers. The circular is not signed, but Mr. Henry C. Bolds encloses his little card—Parties must not call at the address given, as business is only done by appointment. Of course these fellows catch some victims, or the game could not be kept up so long. It is within the power of the police to break the whole thing up in a short time. Only a few days ago Davis & Rowland were arrested, but the detective who personated the stranger from Toronto, was suspected before the rogues had fairly committed themselves. Still it is something to know that they were "locked up for examination." . . . That some

REAL ESTATE AGENTS

are perfectly square business men, we have no doubt, but there are others with whom we should not like to do business. Some letters before us have a very suspicious look. One G. H., of New York, advertised in Maryland and Illinois papers, that he wished to buy a farm. One person in each of the above States, who replied to these advertisements, received each a letter, not from G. H., but from a New York concern calling themselves "real estate agents," informing that G. H. had suited himself to a farm, and turned the letters over to them, the agents. These two letters, one to a man in Maryland, and the other to one in Illinois, are before us, and are, taken together, very interesting reading. The agents write

to the Marylander: "There are two Englishmen, (brothers), *** near Whitestone, Long Island, who desire just such a farm as you describe."—and to the Illinoisian they write: "There are two men, father and son, near Whitestone, Long Island, *** who desire just such a farm as you describe." A remarkable coincidence truly! and Whitestone must be in danger of being depopulated, but the coincidence is not so strange as the correspondence between the two letters, which for four pages of commercial note, are precisely the same, except such trivial verbal differences that one would make in copying. Both pairs of intended purchasers are "willing to pay half cash;" in the Maryland case, the parties are going to view a farm near Lynchburg, Va., and in the Illinois case, they are going to view a farm in Madison, Wis., and (by another coincidence) both pairs of Whitestoners are to start on the 9th of October. In both cases the pairs of Whitestoners are to be persuaded to stop over and see the farms in Maryland and Illinois, and in each case those having the farms to sell, are informed that "these parties mean business," and moreover in both cases "They are of the liberal class, and easily influenced by good treatment." Each man with the farm to sell, is given to understand that these Whitestoners are quite sure to buy. But, for the trouble of getting the Whitestoners "the proper tickets for them, and to see that they go through, and stop at no place this side of yours," these "agents" want \$5 in a registered letter. Of course, if a sale is made, the agents expect a commission, but the \$5 must come anyhow. It is just possible that such a transaction as this is all square, but to our notion, the chance of such a coincidence is about equal to that of these "agents" being struck by lightning. Moral.—Don't invest your \$5 unless you are sure you will get something for it.

Sometimes the literature of quackery is simply disgusting, and one feels ashamed, when he reads the transparent lies, which are told about the discovery of these wonderful nostrums, and the absurd claims made for them, to think there can be found persons so simple and gullible, as to place any confidence in such trash. But there is a still worse feature very common in the quack pamphlets and circulars, their

IMPIETY AND NEAR APPROACH TO BLASPHEMY.

We do not now refer so much to those fellows, who assume the garb of religion as a help to sell their stuff, but to the light and impious ways, in which the name of the Supreme is used, and the manner in which those things, which the better part of mankind hold as sacred, are made to advertise a nostrum. One before us has for its head-line in large letters: "Behold what hath God wrought"—to call attention to a ridiculous yarn about some woman's adventures in Chili in discovering the wonderful herb—which of course grows "only upon a single ridge of mountains." Then she, or he, or whoever it may be, wickedly and uselessly says, "I will stake my existence," that for certain named troubles the stuff is the best remedy known. While these things are vulgarly impious, the circular from which they are taken is not so bad, as that of one who calls himself Dr. Blood. Last month we mentioned the great prevalence of quacks in the generally estimable city of Providence, and a friend there has taken the trouble to send us specimens of the literature that circulates in that place. This Blood sends out a large, four-page sheet, with the cheerful title in large black letters of "Life or Death;" beneath this there are two American flags, which he has had the impudence to besmirch by printing his sanguineous name upon them. At one corner is a picture of what is apparently the Virgin, as *Mater Dolorosa*, with over it the legend "Why will you die?"—and at the opposite corner the head of Christ, crowned with thorns, with a face expressive of great agony. Now we claim that it is absolutely impious to use sacred emblems to advertise one's business of any kind. It would be just as proper for an apple-woman to put up a cross to call attention to her wares, as it is for this Blood to use the image of the Saviour in his suffering to embellish his quack-sheet. With such gross impropriety at the heading, we are not surprised to read beneath, that "where oxygenized air has failed to relieve a patient, nothing but the interposition of Heaven could save him." In another column we learn that Louis Napoleon, Wm. H. Seward, and Horace Greeley might all have been living, but for the doctors, and of Greeley, it is said: "May his soul rest in heaven, where allopathic doctors and hot irons are unknown." It is the duty of every parent to see that such wickedly repulsive literature as this is kept out of the family—not only upon sanitary grounds, but upon moral ones. Children hear an abundance of wickedness, but they should not be allowed to see the names of God and Christ in print, unless mentioned with reverence and affection.

Pure Salt.—"A Dairyman." The Ashton Salt, as imported, is not to be trusted implicitly, as there are said to be four or five different manufacturers who

send salt of this brand to this country. The Onondaga (N. Y.) "factory filled" Salt, is the purest article now made anywhere, and may be relied upon for dairy purposes. Chemical analyses prove it to have less salts of lime, magnesia, or water, than the best Ashton salt, and to have 98.28 per cent of pure salt (chloride of sodium) in its composition, while Ashton salt has but 97.65. At the Central New York Fair, butter packed two years ago with Onondaga salt, was exhibited in good order. Thus the prejudice against American salt, and in favor of the foreign article, is seen to be groundless.

Potash in Compost.—"P. D. H.," Gansvoort, N. H. It would not pay to purchase carbonate of potash for mixing in compost heaps, at \$8 per 100 pounds, which is the market price. It would also require to be ground or dissolved, as it comes in the barrels in large masses, and could not be conveniently used otherwise. The German potash salts (Kainit), which are sold by Geo. E. White, 160 Front St., New York, at about \$30 per ton, would be more economical, and they can be sown by a machine. These salts contain 30 per cent of sulphate of potash, and 16 per cent of sulphate of magnesia. Sulphate of potash yielding 90 per cent, is sold by the same party for 4½ cents per pound.

Castings for Implements.—"Dealer," Rockford, Ill. Castings for agricultural implements, or for light machinery of all kinds, may be procured of Livingstone & Co., Pittsburg, who make a specialty of this business. It would be as well for you to communicate with them.

The American Garden is the title of a new horticultural paper, or rather of a journal that has been essentially changed. Messrs. Beach, Son & Co., seedsmen of Brooklyn, N. Y., for the past two or three years issued a quarterly, which was partly journal and partly catalogue. In September last this was placed in the editorial charge of Mr. James Hogg, and it is now a handsome monthly of 24 pages, somewhat smaller than our own. In its first number of its present form, the Garden saw fit to express itself in regard to the agricultural press in a manner quite uncalled for, and not at all calculated to insure it a favorable reception among agricultural journals, and it chose the Country Gentleman especially, to illustrate the fact, that the agricultural press is given to blundering in floricultural matters. The Country Gentleman of course makes a sharp reply, and an exceedingly neat rebuke was administered to the Garden by the Gardeners' Monthly, which, in its October number, without comment, quotes from the Country Gentleman over half a dozen columns of useful horticultural items. However, we are not disposed to quarrel with the Garden for having made a blunder, and need only say in regard to it, that its editor is abundantly able to make an interesting and useful paper, as he has had a long horticultural experience, and is an easy and pleasant writer. So we give the new journal a welcome, with the remark, that if it chooses to place itself in antagonism with its neighbors, it will find that the agricultural journals will accept the situation.

Book on Diseases of the Horse.—E. H. M., Delaware Co., N. Y. Youatt & Spooner on the Horse, is a useful hook to consult in the absence of a veterinary surgeon. Price, \$1.50.

Deterioration of Sheep.—"L. M. O.," Woodstock, N. H. It is a matter of difficulty, if not of impossibility, to preserve a breed or class of sheep up to its original standard, if the conditions under which it is kept are not suitable. Heavy bodied sheep will persist in becoming leggy and light when bred for a time upon hilly pastures, and if the flock is reinforced by new blood the improvement is only temporary. No breed of sheep can remain in successful or profitable possession of any district, unless the peculiar local conditions as to pasture, climate, and nature of the ground, are found to be exactly fitted for it. It is the inevitable results of such conditions that have produced the wide differences which exist between the various breeds of sheep.

Exports and Imports.—By the latest monthly report from the Bureau of Statistics, we find that the total value of the exports during the fiscal year 1874, exceeded that of the imports by over 39 million dollars; in 1873 the imports exceeded the exports by over 101 million dollars. The balance in favor of the present year, is therefore over 140 million of dollars, and is made up of an increase of exports over 1873, of over 64 million dollars, and a decrease of imports of over 76 millions.

Sweep or Tread-Power.—"R. J. H.," Bedford, Ohio. With a well made tread-power the whole useful effect of the horses is secured. This is not done with the best of the sweep-powers. When heavy horses are used in the tread-power, their weight is usefully applied, but in the sweep there is often no advantage in using heavy horses as against light ones. There is a great economy of space also in using tread-powers. There need be little fear of danger from their use; we have used a tread-power for many years without any accident or approach to one, and have not yet heard of any accident with one.

Field, Cover, and Trap Shooting. by Adam H. Bogardus, and published by J. B. Ford & Co. The author of this work is known as the "champion wing shot of America." This work shows great experience, close observation, and a happy manner of relating adventure and imparting instruction. It is a most interesting book, and one likely to be welcomed by sportsmen. Sent from this office, post-paid, for \$2.

Choice Receipts, by M. S. W., is the title of a work just from the press of J. R. Osgood & Co., Boston. It is a perfect gem in the way of book making, being neat and tasteful to the degree that makes one feel sure that the dishes for which it gives directions must be as good as the manner of presenting them is elegant. This is not a cook-book, but a collection of choice recipes in the different culinary departments, accompanied by concise directions for compounding them. While all else is so complete, it is a wonder that "receipts" should be chosen for the title, instead of *recipes*. There is but one way to test the value of works of this kind, which is to put them to frequent use, and just what we propose to do with this one. Price \$1.50.

Some Species and Varieties of the Lily, is the title of a pamphlet in French, of 35 pages and several illustrations, by J. H. Krelage, Haarlem. A second part is to appear. This work shows that the author, besides being one of the great bulb growers of the world, may claim a high rank as a horticultural writer.

Sore Eyes in Pigs.—"Reader." Inflammation of the eyes, from which pigs are seriously suffering in some parts of the West, is only a symptom of a disease which is known as apoplexy. It is a blood disease, closely related to cholera, and causes an excessive congestion of all the membranes of the head, which is shown in their inflamed condition. There are some other symptoms, very similar to those of "black quarter" in cattle, viz.: black soft patches in various parts of the body, just beneath the skin. The best treatment is to give a strong dose of salts at the first appearance of restlessness and redness of the eyes, and put the animals upon low cooling diet. The cause is want of pure water and too sudden over-feeding, or feeding with unripe corn.

Eight Toes upon one Foot.—"G. H.," Clinton Co., Ohio, sends us a foot of a chicken, which has eight toes upon it. It was very nearly a case of a three-footed chicken, as the line of juncture of two legs is very apparent, and there are two distinct leg-bones.

Sheep Fence.—"G. B.," Coos Co., Oregon. To have a secure fence for sheep it ought to be at least four feet high. If made of boards, the lowest one should be 6 inches from the ground, the second 6 inches from the first board, the third 9 inches from the second, and the fourth 10 inches from the third. This will give 31 inches of space and 24 inches of boards, in all 55 inches, which would be safe for any but very breachy sheep.

Canvass Roofing.—"F. G.," Herkimer Co., N. Y. The chief fault of canvass roofing is its cost. It makes a tight, durable roof, if kept well painted. The roofing felt made by Fay & Co., Camden, N. J., is much cheaper and is as tight and durable as canvass.

Aphtha in Cattle.—"S. A.," Moosup, Conn. This disease, much more serious than that known as foot-rot, is often taken for it, because the foot is first affected. It is an eruptive fever, which occurs but once in the life of an animal. It affects first the feet, and generally the off or right hind foot is first attacked. Small blisters form between the claws and around the coronet of the hoof, causing great pain, and the animal holds the affected foot backwards and shakes it, or lies down, and is disinclined to rise. If the mouth is now examined, the tongue, lips, and inside of the jaws, are found inflamed in patches, and small blisters as large as a pea appear. By and by these, as well as those on the feet, burst and run together, forming raw surfaces, which are very sensitive and painful. The hoofs often slough entirely away. In a few days the raw surfaces are covered with scabs, the fever is lessened, and from the tenth to

the fifteenth day the disease abates. It is highly contagious, and fresh animals introduced into the farm or stables where it has prevailed, are taken down rapidly. The treatment recommended is a purgative of 8 ounces of Epsom salts mixed with 2 ounces of gentian root powdered, and $\frac{1}{2}$ a pint of molasses. This is placed upon the tongue in portions, until it is all swallowed. The feet are poulticed with linseed meal, or fomented with hot water, until the blisters are broken and suppuration occurs. They are then dressed with a pint of water, in which 2 drams of chloride of zinc and 1 ounce tincture of myrrh has been dissolved. The food of the animal should be mashes of barley malt, with some linseed meal, or boiled oats, green clover, or chopped carrots, and generally cooling laxative feed and demulcent drinks, as linseed or oat meal gruel. It is well to procure professional assistance if possible. The stables should also be thoroughly cleaned, disinfected, and whitewashed.

Pasturing Sheep.—"G. B.," Coos Co., Oregon. A newly seeded pasture should not be used until the grass has become well rooted. It may be mown once before sheep are turned upon it. A year's growth at least should be allowed before the grass is pastured. Sheep will not eat ferns.

Brick Machine.—"E. O. M.," Tracy City, Tenn. An excellent brick machine that can be worked with two horses and three men, is made by R. H. Allen & Co., of 189 Water-st., New York. It costs \$450, and will mix clay, and make 25,000 bricks per day. A machine to make tiles can be procured for \$325.

Cheap Food for Store Hogs.—"D. L. Z.," Rolla, Mo. Corn is neither economical nor wholesome food for store hogs. A small portion of corn ought to be fed; but the greater bulk of the food may be made up of boiled potatoes, cut clover, hay and corn fodder, scalded and sprinkled over with wheat or rye bran, and slightly salted, mixed together and fed cold. We have fed store hogs upon this food throughout the winter, and kept them in growing thrifty condition at very little expense. The clover and corn fodder is eaten readily along with the potatoes and bran. For drink we gave a thin slop of corn meal and bran, which was allowed to ferment and sour slightly.

Floating Curds.—"A Dairyman," Utica, N. Y. The cause of floating curds is much disputed. Probably few dairymen, who profess to have studied the matter, agree upon any one thing as the true cause, and many allege widely different reasons for it. The cause has been variously said to be in the cow, in her food, in the water she drinks, in the air she breathes, in the fullness of the stables, in the care of the milk, in the condition of the dairy utensils, in the condition of the air; electricity has been blamed for it, as has that very handy and useful, but indefinite cause called "germs in the air." It is easier to say what is not the cause than what is. It is still a matter for close investigation.

Shipment of Bone-Dust.—A 500 ton vessel has recently cleared from Chicago for Liverpool, loaded with bone-dust. The sending off of this indispensable fertilizer from our own fields is to be regretted, the more so when we consider that the Illinois prairies are already falling off in their produce of grain, and can hardly spare the loss of the bone which represents their past fertility.

Preservation of Manure.—Investigations have been made by Professor Way, of England, by which the increased value of manure kept under shelter is accurately determined as against that exposed in open yards. The following are the relative values as determined by analyses of the dry manures, the water being nearly equal in each, and about 71 per cent:

	Covered Manure.	Yard Manure.
Nitrogen, equal to ammonia, per cent.	2.37	1.7
Organic matter, soluble in water.	6.42	1.82
Phosphoric acid.	.30	.26
Alkalies.	2.00	.50

The other constituents, not being of importance, were not determined. The value of the covered manure is seen to be more than double that of the other.

Beef Clubs.—"A Beef-eater," Akron, Ohio. The difficulty in the way of farmers procuring a regular supply of fresh beef or mutton might easily be removed by forming beef clubs, as is done in Tennessee. One of these clubs has been in operation 20 years. There are 16 members. Each member provides a three-year-old steer, or a cow, and feeds the animal so that it shall be ready for the butcher at a stated time. Each member's time is fixed at a meeting for that purpose. Each animal is to be of such a quality that there shall be 12 $\frac{1}{2}$ per cent of

tallow to the meat, or a fine of \$5 is levied. The best beef draws a premium of \$10. A butcher is selected in some central locality, who slaughters an animal every Saturday and divides it into sixteen portions of equal value. He keeps a correct account of each animal, credits the owner with the proceeds, and charges each member with his share. At the end of the term a settlement is made, and those who are in debt pay the amounts, which are then paid over to those who have a credit. Of course the debts exactly balance the credits on the whole. Each member gets about 25 pounds of beef every week. If it is desirable, the club might consist of 26 members, and each one might provide a beef twice a year. This would give a constant supply. Then, if the dogs were looked after and a dozen sheep kept on every farm, there would be plenty of lamb and mutton.

A Perfect Harrow.—"L. D. N.," Annapolis, Md. We know of no perfect harrow, that is one that will do all the various kinds of work that harrows are expected to do. There are some implements that are better than others for certain uses. Thus the Thomas' Harrow is unique for light work, such as grass seeding, or for destroying weeds, while the Nishwitz or the Shares' Harrow will cover sod or mellow the soil better than any others we know of, unless perhaps it be one recently brought to our notice, known as the "Wheel Harrow," which, in addition to the excellent form of the teeth, can be raised or depressed, and which has some other advantages. A farmer that has various kinds of work to do, needs more than one harrow, and if he has a good roller, there are many uses for which it may be usefully made to supersede the harrow. By and by we believe the ordinary harrow, as we know it, will be displaced by much more acceptable implements, such as the grubber and the various surface cultivators. The day of the old-fashioned square-toothed harrow is about over.

Salsify, When and How to Use.—"G. P." Salsify, or, as it is often called, Oyster Plant, may be used whenever the root is large enough, but as it is never much over an inch in diameter, those who sell it usually let it grow as large as possible. Whichever way it is cooked, the first step is to scrape it to remove the skin, and throw each root into water as soon as scraped, to prevent it from turning a dark color. It may be cut into inch pieces and stewed tender, adding milk, butter, and a little flour, to make a sauce. It may also be fried; one way is to cut the root into convenient pieces, boil until tender; dip in batter and fry like fritters; another, boil tender, mash, and make into balls, which are floured and then fried brown. The writer, who has it two or three times a week during the winter, has it cooked by stewing almost exclusively.

Trout in Hard Water.—"Badger," Berlin, Wisconsin. Trout will thrive excellently in hard water, if the hardness is due only to carbonate of lime. Some of the best trout streams run through a limestone country. Clear cold rapid running water, free from any other mineral impurity than lime, is well adapted for these fish. Washings from lead or copper mines, the refuse from dye works, or woolen mills, or sawdust from saw mills, in excessive quantities, will kill or drive away trout. The drawing of wagon-jack is received.

Carbolic Acid in the Dairy.—"A. E. R.," Jefferson Co., W. Va. There is nothing that absorbs strong odors more readily than cream. If so strong a smelling substance as carbolic acid is used in a milk cellar, it would certainly spoil the cream, and the churn would absorb some of the odor if the cream was churned in it. Probably the best way to purify the churn in such a case, would be to put it in a running stream for a few days, or until the scent disappears.

Salt upon Wheat.—"Reader," Clyde, Ohio. Salt being very soluble should only be applied to wheat in the spring, when it can be appropriated by the plant. It is generally used in quantities of two to four bushels per acre, to stiffen the straw.

Compost Heaps.—"A. J. M.," Hollansburgh, Ohio. Compost heaps are made by mixing a portion of fresh stable manure with vegetable or animal matter, which by itself would not readily decompose. The substances used are placed in layers in a close compact pile, made flat on the top so as to catch enough rain to keep it moist. The manure sets the whole in a fermenting condition, and it quickly decomposes. It frequently occurs that the pile must be taken down, turned over, and piled up again for a second fermentation, before it becomes well rotted. "Dommer's art of making manure," describes an excellent method of making composts. It costs 25 cents. Patent expired.

See Page 433.

Noise in a Horse's Abdomen.—"F. A. G.," Stirling, Ill. The unpleasant noise referred to is frequently caused by an accumulation of wind or gas in the bowels. Some horses are subject to chronic flatulence on account of indigestion. A remedy might be sought in feeding moist food with bran mashes, or some linseed meal, so as to keep the bowels somewhat loose, adding half an ounce of salt to each feed, and giving a dram of copperas with one ounce of ginger at night, for a week or two. It is often incurable.

Lands in Eastern Virginia.—"C. F. S.," Guernsey Co., Ohio, may communicate with Chaffin, Staples & Co., of Richmond, Va.

The Preparation of Plaster.—"W. W. S.," Hallock, Ill. It is very probable that plaster would act favorably upon clover in your soil. We have known it to be used with success in most of the Western and Northern States. The rock plaster can be purchased cheaply at Saginaw or Grand Rapids, Mich., and in Syracuse, N. Y. The freight from either place in bulk would not make it too costly for use. It should not be hurried before being ground, nor should any plaster be purchased that contains any impurity whatever. It can be ground, after having been broken into small pieces, between common burr-stones, such as are used in a grist-mill. There is a great deal of ignorance as to the use and nature of plaster where it is not much known. It is not lime, nor does it possess any of the caustic or other qualities of ordinary lime, but is a perfectly distinct compound of lime, sulphuric acid, and water.

Ditching Machine.—"E. M.," Santee, S. C. The Carter Ditching Machine, to which we have referred, would not answer the purpose of clearing out the ditches of rice plantations. It would not be difficult, however, to construct a machine to be drawn by mules, which would clear out the growth of weeds and the accumulated mud, and deposit them upon the bank, if it should be found cheaper to do the work in that manner than by hand labor. It is a question of cost altogether.

As to Pigeons.—"E. M.," Santee, S. C. The common domestic pigeon would probably be as profitable to raise as any. A loft over a poultry house would answer very well for the roost and nests, but it should be kept perfectly clean. Peas are favorite food for these birds, as many a gardener knows to his cost, barley or oats may also be fed to them.

Cultivation of Barley.—"C. J.," Roanoke Co., Va. It is better to make barley a spring crop. If fall wheat happens to be a failure, the ground may be replowed and sown to barley very conveniently and profitably. There is no better crop than this with which to seed down to clover or timothy. Barley is imported from Europe to supply our markets, and this fact would imply that its culture ought to be profitable. As feed a good crop of barley is more profitable than oats, and there is no grain better for horses, pigs, and poultry. It thrives better under heat than oats, but must have a good soil and clean tillage. If you have these, we know of no reason why you may not grow this crop with profit. If you can raise 20 bushels of wheat per acre, you ought to produce 40 bushels of barley.

Guano for Grass.—"H. C. C.," Gardiner, Me. A usual dressing of guano for grass is 250 pounds per acre. It depends, however, upon the nature of the soil whether two tons of hay per acre can be grown yearly. We have known the above quantity of guano to double the crop of grass, but in a dry season we have known it to fail of effect entirely.

Stable for a Colt.—"J. H. B.," Watertown, Ct. We would prefer to keep a colt or a horse in what is called a loose box, rather than in a narrow stall, and tied up. There is always some danger when a horse is tied in a stall, but none in a properly constructed loose box. The box should be 12 feet square, with walls 6 feet high; the feed trough should be made to swing outside of the box into the feed passage, so that there is nothing inside that could cause any accident whatever. A valuable horse is thus safe from accident, and the extra cost of such a stable is repaid in many ways.

Cheese Press.—"E. F. P.," Anderson Co., Texas. In the *Agriculturist* of April, 1874, will be found an engraving of a cheese press, which any mechanic can make, and metallic hoops. The power may be applied by means of a lever, or the screw may be procured of Millar & Co., Utica, N. Y.

South Carolina Phosphates.—There are 18 companies engaged in mining phosphate rock in South Carolina. The produce last year was 112,515 tons,

of which 18,000 were used in manufacturing fertilizers in Charleston, 41,975 tons were shipped to Northern ports, and 52,730 tons were shipped to Europe.

Scalding Feed.—"A. B.," Hancock, N. H. —It would be very advisable during the winter months to cut the hay or fodder fed to cows, and after mixing the meal, or shorts, to be fed with it, to scald the whole with boiling water in a feed box or barrel. It should be covered closely with a lid or thick cloth, and allowed to cool down to a moderate warmth before feeding it. If the feed for 10 or 12 head is thus prepared, a 10-hushel box or chest would be large enough to scald the feed in, and that quantity of feed, closely covered, would take 12 hours to cool down sufficiently to be fed. More feed thus prepared would be eaten than of dry feed, and it would be more digestible. Each cow should have at each feed a bushel of cut hay with one quart of meal, and half an ounce of salt.

The Dairy in Colorado.—"W. W. L.," Rockford, Ill. There are numerous grassy valleys in the mountains of Colorado, where dairying may be carried on successfully. These are too small for stock-raising purposes, and are therefore free from interference from stock men. The water is cool and pure, and it is doubtful if there are any better locations for co-operative butter or cheese factories, than these retired valleys.

Half-bred Colts.—"W. M. S.," Ashleyville, Mass. No half-thoroughbred colt that is of any value, could be bought for \$75. The fee for the services of a good stallion is often \$50 to \$100, and the service of very few real thoroughbreds could be had for those prices. The value of any good colt, four or five months old, of common stock, ought to be \$75. It would therefore be labor lost in seeking a half-thoroughbred for that price.

Abandoned Farms in the East.—"T. E. L.," Wilmington, Del. The statement that large portions of the New England States are depopulated, and farms abandoned by hundreds, is too absurd to need a denial. No person should suppose that any farm is abandoned by its owners, or that any land is thrown out of cultivation, where farm products bear the price they do in New England. These abandoned farms and houses exist only in imagination. There is a large portion of New England that is fit only for pasture, and we have seen hill-farms that persons used to level, smooth land, would consider of little value, that on the contrary are profitable dairy farms and worth \$100 an acre for pasture alone. If any person wants to buy a good farm, in a good locality, in New England, he would have to pay at least \$100 to \$200 per acre. Sheep farming, however, can not be made profitable as a special business on the small farms common in New England, and there is no such wide range to be had there, as in some parts of the West.

Reclamation and Protection of Land.—This is the title of a small work, by David Stevenson, Vice-President of the Royal Society of Engineers, descriptive of the methods of embanking tidal rivers, for the purpose of reclaiming marsh or overflowed land, which have been adopted successfully in Scotland. By the system described no less than 7000 acres of land have been reclaimed on the banks of the river Dee. Considering the vast field which is presented to us in our tidal rivers and estuaries, for both improving navigation, and making valuable land, this book will be found of great interest and value. Published by A. & C. Black, Edinburgh.

New Market for Grain.—A cargo of oats, and one of wheat, have been recently shipped from San Francisco to Callao, Peru. A cargo of barley has also been shipped to Iquiqui, in the same country. These cargoes are the first that have been shipped to these ports from California, and mark the opening of a new trade in grain.

Failure to Breed.—"J. N. P.," Sharon, Pa. Ground rye has no injurious effect upon the breeding of a mare, any more than other grain, unless it is fed in excess, so that the mare is kept in too high condition. If the condition is too high, the mare may be reduced by bleeding, or by extra work with a reduction of feed. Bleeding and turning the mare to grass with the horse, is often resorted to in such a case as this, but the shoes should be removed for fear of injury by kicking.

Bog and Blood Spavin.—"H. E. H.," Brownsville, Pa. In 1873 we said "hog and blood-spavin are two different things, although they often exist together. Bog-spavin rarely causes lameness, but is frequently incurable." You have not quoted this correctly. Blood-spavin is an aggravated form of hog-spavin, and is an unsoundness in a horse, while bog-spavin is not an

unsoundness, unless it interferes with the action of the joint, which it rarely does. Windgalls rarely cause lameness, and are not of themselves an unsoundness. These hemishes are often hereditary, but are generally the effect of hard work, and in this case, if cured, will appear again upon the first return of the original cause.

Lands in Nebraska.—For the benefit of several enquirers, we would say that the lands belonging to the Union Pacific and Burlington and Missouri railroads in Nebraska, are situated in the valleys of the Platte and its tributaries. These lands are as rich as any in the West, and the climate is exceedingly healthful. Spring wheat, flax, oats, and corn, are the chief grain crops raised on the newly broken prairie. The lands are sold at low prices and on easy terms of payment, and the country is settling very rapidly. There is no State in which agriculture is more liberally fostered by the government, than in Nebraska. The only want is timber, but timber may be much more easily and quickly grown upon a prairie farm, than a farm can be cleared out of timber lands.

Salt as a Fertilizer.—"A. F. R.," Newark, Ohio. Salt being readily soluble, should be sown upon wheat at that period when it can be appropriated by the plant most usefully. As its effect is in some manner as yet undetermined to stiffen the straw and help the plant to appropriate the necessary silica for this purpose, it should be sown in spring, before the grain commences to ear. Early in April would be a good time to sow it upon this crop, or upon rye. For oats it should be sown when they are six or eight inches high.

Sale of a Jersey Herd.—The herd of Jerseys belonging to I. H. McHenry, of Maryland, were sold at public sale on the 2nd of September. The prices realized were very low, varying from \$17 up to \$405. H. C. Kelsey, of Trenton, N. J.; W. E. Dougherty, of Harrisburg, Pa.; and Col. F. D. Curtis, of Kirby Homestead, Charlton, N. Y., were the principal purchasers. The highest prices were \$310 for an imported cow, "Gold Drop," over six years old, and \$405 for "Laura," 5 years old, bred by Mr. McHenry.

The Swivel Plow.—"A. R. C.," Ham. Co., Ohio. It depends somewhat upon the soil, whether a swivel plow, as indeed any other plow, will turn a perfect furrow. There are some soils in which no iron plow will turn a perfect furrow, and steel plows must be used. There are no steel swivel plows yet made, and we could hardly say that any iron swivel plow we have yet seen or tried, will do all that is claimed for it in every soil.

Roup in Fowls.—"Old Subscriber," Crescent City, Cal. One of the symptoms of roup is inflammation of the eye with swelling, and discharge of fetid matter. Unless some remedy is applied, the eye is destroyed or the bird dies. A remedy which is generally effective, is to wash the eye, mouth, and nostrils, with a solution of chloride of zinc, one ounce in a pint of water, by means of a feather. The cause is frequently cold, inflammation resulting from feeding too much grain, foul unventilated quarters, or over crowding.

Lands in Iowa.—The settlement of Iowa has progressed so far, that desirable homesteads upon government land, can no longer be procured. It is only in a few of the northwestern counties, that any government lands remain unoccupied. Rather than take these for nothing, a settler had better pay a fair price for lands near a railroad; indeed he will save money by so doing. There are 1,500,000 acres of the best lands in central Iowa, belonging to the Iowa Railroad Land Company, offered for sale at from \$5 to \$7 per acre. This part of the State is well watered, is a good grass, corn, and wheat region, and is only a short distance from Chicago.

The Texas Cattle Trade.—The present year's cattle trade at Topeka, Kansas, is 25 per cent larger than that of last year. In 1873, 118,206 head were handled; in 1874, 155,300 have been handled, and there are 115,000 more in the State to come forward. The whole number shipped and to be shipped from the State the present season is estimated at 500,000, worth 10 millions of dollars. This is but the beginning of the cattle business, which has grown to these proportions since the opening of railroads in Kansas. The demand for these cattle is yearly increasing, and the produce keeps pace with the demand; the immense facilities for raising cheap cattle in the States of Texas, Kansas, and Colorado, being unequalled elsewhere, at the same time the use of improved or pure bred bulls is largely adding to the value of the stock now raised.

Preserving Green Fodder.—"H. L.," Transylvania Co., N. C. The method of preserving green fodder, recently described in the *Agriculturist*, is practiced extensively in Europe, and has been in use for many years. In a recent number of a French agricultural journal there is a statement of a large farmer, who put up in this manner 100 tons of corn fodder in 1871, 200 tons in 1872, and 150 tons in 1873. He used 3 lbs. of salt to the 1,000 lbs. of fodder, half dried. When the fodder is not so dry, more salt is used. It is necessary that the fodder be perfectly free from external moisture, and be also partly dried or wilted: that it be packed very closely; that the covering should be at least 2 feet thick, and prevent access of air, and that the pit be dug in a perfectly dry spot, and be kept free from water. It might be well to try again. We have seen beet leaves taken from such a pit in the spring, which were packed away in the preceding fall, and they were readily eaten by cows and oxen.

See Page 433.

"Walks and Talks" Correspondence.

GRADE ESSEX PIGS.—C. W. Hess, Columbus, O., writes: "I have a fine drove of black pigs, from large Poland-China sows, and a thoroughbred Essex boar. I am well pleased with the stock, and think it is a good cross."—This is precisely what I should expect. Another cross of the Essex on these young half-bred sows will, I think, give still finer pigs. It is only when you resort to the use of cross-bred or grade males that the stock begins to show a want of uniformity.

WHEAT FOR HORSES.—The proprietor of an extensive mail-route in the South-west, where the grasshoppers have destroyed nearly everything, except wheat, writes that he has contracted for 10,000 bushels of wheat, at 50 cents per bushel, to feed his horses. So far they have done well, and the wheat is much cheaper than oats. I suppose the only danger is from the horses eating too much at a time. If it could be soaked in water for four or five hours, it probably would be less likely to swell in the stomach, or produce colic. If ground, and mixed with cut hay, it would be still better, but I suppose this can not be done.

A SMALL FLOCK OF SHEEP.—"A Young Farmer," of Washington Co., N. Y., says he wants to keep a flock of fifteen sheep, and asks, "if Spanish Merinos would not be best to raise full-bloods, or for early lambs for the butcher, and for wool?" I think not. With good care some of the "mutton breeds," such as the South Down, Shropshire Down, Leicester, or Cotswolds, would pay better in such circumstances. On cheap land, where sheep are kept in large flocks principally for wool, the Merino would be the most profitable breed.

THRRESHING WHEAT FROM THE FIELD.—A correspondent in Beaver Co., Pa., writes: "You speak of threshing your wheat as you haul it. How did you get your hands? Did you thresh in the field?"—No. I drew it to the barn, so as to stack the straw where I wanted it. We thresh with a ten-horse machine. The "threshers" charge 5 cents a bushel for wheat, 4 cents for barley, and 3 cents for oats. They furnish the machine, and four horses, and four men." One of the men drives, one feeds, one carries away the grain, and the other oils and looks after the machine, changing occasionally with the feeder. In threshing from a stack, or from a bay, it usually takes 2 men on the stack, and sometimes 3, 1 to cut the bands, 2 on the straw-stack, and sometimes 3=5 men, besides the threshers, and sometimes 7. In drawing and threshing from the field, it takes: 1 man to pitch, 3 men to load, drive, and unload, 1 to cut bands, 2 men on the stack, and sometimes 3=7 men, besides threshers, and sometimes 8. I keep eight farm-horses and four wagons. The Deacon and the Squire exchange work with me, sending a team and a man each. Or, if they have not the time, I get some other neighbor. You see from the above statement, that it takes only two more men to draw in and thresh, than to thresh alone—and sometimes only one man more.

SOWING DIFFERENT VARIETIES OF WHEAT TOGETHER.—"R. G.," Plymouth, O., writes, that the wheat crop of his section has been an extraordinary one. He has heard of no crop less than 20 bushels per acre, and one that was 46 bushels per acre. "The same man," he says, "had 40½ bushels on the same land last year. Last year he mixed three kinds of wheat together for seed. This year he had some five or six kinds. What is your opinion as to the advantage of mixing different varieties of seed together?"—I have seen accounts of large crops being produced in this way. I think, however, if your land is rich enough, and you should select the best one of the wheats,

you would have as good a crop, as if you sowed half a dozen kinds.

THICK AND THIN SEEDING.—"R. G." says: "Farmers here (Ohio) have been in the habit of sowing 1½ bushels of wheat per acre. I am satisfied it is too much, if the ground is in good condition and the seed all sound."—There is one point that should not be overlooked in discussing this question: *Thin sown wheat is apt to be late.* And late wheat is more liable to injury from rust and mildew than that which ripens earlier. If everything is favorable, the late wheat may produce the heavier crop.

SUFFOLK HOGS.—Mr. Isaac Stickney, of Henry Co., Ill., who, when a resident of Massachusetts, was one of the earliest importers and breeders of Suffolk hogs, writes me that he still admires the Suffolks more than any other breed, but that they will not thrive with ordinary usage on the prairies. This is owing to the hot sun and prairie mud, (not wind, as I printed it in the June No.) "In hot weather," Mr. S. remarks, "our hogs get into the wet and muddy sloughs. This mud sticks so tight to the skin of a Suffolk hog, that it is very hard to rub off. It can be washed off. This dry mud frets them so much that they do not thrive well, and it frequently chaps and cracks the skin. Our black hogs with a thick skin, well coated with bristles, are not troubled with the mud."

MOIST FALLOW GROUND.—A farmer writes me that he summer-fallowed a piece of land for wheat this year. His usual practice has been to sow oats and follow them with wheat. "We stirred the land," he writes, "every two weeks alternately with Carhart's two-horse cultivator and Thomas' harrow. We sowed our wheat on the 28th of August, and found the ground in quite good order, and far more dampness than in the oat stubble, which is being plowed to-day" (Sept. 3). This is a well known fact. A growing crop takes large quantities of water from the soil. The roots absorb the moisture from the soil, and the leaves evaporate it into the atmosphere. The frequent stirring of the surface soil would make it fine, and it would act as a mulch and check the evaporation of water from the soil underneath.

SEEDING WITH OATS.—"You say," writes the same correspondent, "that wheat is the best crop to seed down with. We as often hit a good sod with oats as with wheat."—My own seeding this year is better with spring barley than with winter wheat—both being in the same field. I presume more depends on sowing early and having the land fine, mellow, and in good condition, than on the kind of crop.

The New York Flower Auctions.

For several years past the Florists in the vicinity of New York, as well as those from Philadelphia, Baltimore, Albany, and other places, have adopted the method of selling their surplus stock by auction in New York City. These sales are almost exclusively attended by the Trade, as the lots offered are usually too large for amateurs wishing plants for their own use. This season these sales have been held nearly every other day since the first of September, and will probably continue to the end of November.

The articles sold embrace nearly every thing in the way of flowers cultivated in our gardens and green-houses. The prices so far this season have been lower than usual, so low that it would astonish many of our readers to see plants that they cannot purchase for less than 50c. or \$1 each, ruthlessly struck off by the auctioneer at may be \$5 per 100.—But then this hundred is all of one sort, bought by some florist, from a neighbor florist, who happens to be unable to grow the article, or to be out of it. Still many articles bring, even in quantity, their full retail value, and it is a pleasing fact to observe a growing taste for the finer and rarer plants. A few days ago a box of 200 *Tritoma grandiflora*, (red-hot poker plant), was put up, and as some thousands of it had been previously sold, the lot went a begging at \$2 per 100. The next lot was 100 seedlings of *Dracena indivisa*, a rather scarce hot-house plant, bearing, in its weak condition, some resemblance to the *Tritoma*, but the knowing ones quickly detected the value, and the tiny plants of the *Dracena* brought \$25 per 100.

These sales are almost exclusively conducted by Mr. Elliot, of Young & Elliot, the well known seedsmen. Mr. Elliot is not only well gifted with the talents necessary in an auctioneer, but he brings to his assistance the knowledge that a 25-year's experience has given him as a practical horticulturist. The purchasers at these sales are not confined to the vicinity of New York, but come from points, many of them, 100 to 200 miles distant, and it is not unusual to see from 75 to 100 growers and dealers in flowers assembled in the auction room, expecting "bargains" from the hands of the auctioneer. To all interested in plants, the auction room No. 12 Courtland

St., is a most attractive place from 9 A. M. to 4 P. M. During the fall months there is a continuous stream of wagons, loading or unloading plants of every variety, and from every clime.

As there is not an Horticultural Society in New York, Brooklyn, or Jersey City, with their nearly two millions of inhabitants, it is no wonder that many of those who hunger after flowers are attracted by the exhibitions at the Plant Auction Room.

Catalogues, etc., Received.

Since the very full list given last month was made up, the following have come to hand:

NURSERIES.

SAMUEL KINSEY, Dayton, O. Small fruits and ornamental shrubs.

J. & W. K. JUDEFIND, Edesville, Md. The Amazon Raspberry.

MERRELL & COLEMAN, Geneva, N. Y. Special circular of a new early grape, the Whitehall.

WM. H. MOON, Glenwood Nurseries, Morrisville, Pa. A semi-annual trade list.

ROBERT DOTGLAS & SONS, Waukegan, Ill. Wholesale list of their immense stock of evergreen and ornamental tree seedlings.

PHINNEY & Co., Sturgeon Bay, Wis., present their catalogue of forest trees in the form of a journal, called "The Evergreen."

C. L. HOAG, Lockport, N. Y., makes a specialty of grapes and strawberries, and sends his wholesale list.

A. HANCE & SON, Red Bank, N. J. Special circular of Queen Victoria Daisy.

WILLIAM PARRY, Pomona Nursery, Cinnaminson, N. J. This celebrated establishment comes out with a brand new and very full catalogue. Pray, friend Parry, what is the "Carolina Poplar"? We were not aware that any poplar grew there that is not found in the Northern States.

JOHN SAUL, Washington, D. C., whose name is usually associated with floriculture, has also a large nursery stock. Those who doubt it should send for his catalogue.

FLORISTS.

JOSEPH W. VESTAL, Cambridge City, Ind., sends an abridged price list.

MILLER & HAYES, Mount Airy Nurseries, Phila., have a magnificent collection of roses, which they tell about in a special and very handsome catalogue.

MISCELLANEOUS.

A. I. ROOT & Co., Medina, O., have all kinds of apiary requisites, from bees to gather honey to extractors to take it away from them. And more than that, they publish every month a neat little journal, called "Gleanings in Bee-Culture," which tells how to do all sorts of things, to, with, for, and about bees.

ORANGE CO. MILK-PAN COMPANY, which is, of course, made in Delaware Co., N. Y., at Franklin, gives reasons in a catalogue why their pan is superior to others.

W. G. MONK, Brooklyn, N. Y., has an account of his Steatine wares. We have seen his flower-vases, and like their looks.

E. I. HORSMAN, 100 William St., N. Y., sends an immense catalogue of games and toys, prominent among which are the renowned Acrobats.

THOMAS H. SPEAKMAN, Phila., Pa., sets forth the excellencies of his Combination or Prairie Fence.

J. HYDE FISHER, Chicago, Ill., illustrates his refrigerators in a large pamphlet. Fisher is a very cooling chap, and he refrigerates everything, from a family to a railroad car.

EUROPEAN CATALOGUES.

WILLIAM BULL, Kings Road, Chelsea, London, S. W., has a list of bulbs of appalling magnitude.

WILLIAM BRYN & Co., Glasgow and London, send a wholesale price list of vegetable and agricultural seeds.

The State Fairs.—We regret that we have only space sufficient to barely mention the State Fairs, as many of them were deserving of special notice, for the praiseworthy efforts made by their managers to render them attractive and instructive. Amongst those of which we have notes are the New York State Fairs, (the State Fair and the Western N. Y. Fair). These two were held at the same time and at the same locality (Rochester), and it was not at all a difficult matter for persons wanting to go to one fair to find themselves in the other. Probably this competition was one of the reasons why the stock on exhibition at the State Fair was inferior to that shown on previous occasions. The

usual courtesies extended to members of the press were forgotten at this fair. The managers of the Western N. Y. Fair were more thoughtful and enterprising, and from a rapid survey of the grounds, we judge this fair to have been the more successful of the two. The New Jersey State Fair, at Waverly, was unfortunate in having a succession of stormy days, which necessitated a postponement. In all else this fair was a well deserved success, and its ill fortune is to be regretted. The Connecticut State Fair, held at Hartford, was the first agricultural and industrial exhibition of the Connecticut Stock Breeder's Association, and was well attended. The stock on exhibition was very good. One of the side shows here was a fat heifer, 7 years old, said by her owner to weigh 4,000 lbs.; among the horses exhibited was a stallion 18 years old, with 15 of his colts. The other of the State Fairs in New England were sufficiently successful to satisfy their managers and the public. The Pennsylvania State Fair opened at Easton, Sept. 29. Here there was a large collection of stock, of which the horses were very fine. This was a better exhibition than any previous one we have seen in this State. The Illinois State Fair, as usual, had an immense exhibition of stock. The Shorthorns, of course, predominated; the Percheron horses made an attractive show, which was deservedly popular; the hogs, more especially Berkshires and Poland-Chinas, were in great number. The Iowa State Fair opened with nearly 5,000 entries, and was well attended. The Kansas State Fair made a remarkable show, considering the reported devastations of the locust and chinch bugs. Certainly a good deal must have been left, if the collections of products gathered by the various railroad companies were a fair sample. But the Kansas people have long been noted for the cheerful way in which they take their mishaps as they come. At this fair horse-raising and whiskey-selling were prohibited by the Legislature, nevertheless it was the most successful in a pecuniary way of any fair yet held. The pomological display this year was especially good. Nearly all of the above remarks will apply to the Nebraska Fair, which was very similar in character to that of its neighboring State. As a rule, the present year has been remarkable for an increased popularity of the county and local exhibitions, and for a corresponding neglect of the State fairs by the farmers. One could not fail to observe in some cases that the visitors were in great part dwellers in towns and villages, and not farmers. Perhaps this is not to be regretted, for if farmers sustain their county and local fairs well, many of the State fairs might usefully be given to those who will be easily satisfied with a very little of the agricultural and a great deal of every thing else. It is to be hoped that we may sometime see an agricultural fair that is really what its title suggests, and that farmers will be found ready to support and encourage such a fair. Farm stock and implements, farm products, and trials of machinery, with plowing matches, ought to be sufficient of themselves alone to make up an attractive agricultural fair without the aid of the contents of an immense variety-store, which serve to fill the eye for a moment and then are forgotten.

Introducing a "Professor."

LADIES AND GENTLEMEN:—We would introduce to you a "professor."—We know he is a professor, because he signs himself so, and as we shall show, he professeth much. His name it is James N. Bishop, and his dwelling place it is Plainville, Conn. His vocation was a florist, but now he is a "writist."—We became acquainted with "Professor" James N. through the medium of the *Manchester News*. The Editor of the *News* has an article praising the "professor," and in the same column the "professor" has an article praising the *News*. From both these articles we glean that "Prof. B. has retired from the business he so long followed, and consequently having no axe of his own to grind, may be relied upon as the best authority in the matter of horticulture."—See that now—here is a "best authority" who has been in retirement, and has only now come out, to speak horticulturally, in full blow. Then the "professor" says, "we shall aim only at the truth in horticultural discussion"—which he proceeds to do—only the "truth" gets badly hit when James N. "aims" at it—but he "shall seek in this department to record the best obtainable information"—and that is just exactly what he does. His first contribution to enlighten the people of Conn. is on "Soil for Potting Plants," and this "professor" knows just where to go for the "best obtainable information," and finds it too—else what's the use of being a "professor." His information was "best obtainable" in "Practical Floriculture," written by Peter Henderson, and published by the Orange Judd Company. The article in the *Manchester News* for Aug. 8 is, sentence after sentence, quoted word for word from Chapter V. of the work above referred to; a few omissions are made,

such as Mr. H.'s invitation to the public to witness his operations, and a few verbal alterations are here and there, but the article is essentially, in its ideas and language, Peter Henderson's, yet it is signed James N. Bishop. Our publishers might invite the publishers of the *News* and this Bishop into court for violation of copyright, but we have no doubt the *News* was imposed upon by this pretender, and as for the "Professor," it is not likely that any one who would be guilty of the meanness of appropriating another's labors, can have anything of his own with which to pay damages.—Mr. James N. Bishop, there are many men on Blackwell's Island, sent there for offences which appear respectable by the side of yours.—And yet you style yourself a "Professor of Botany and Horticulture."... The *News* states that this article on "Soil for Potting Plants," is to be followed by one on "Temperature and Moisture."—As that is the title of the very next chapter in "Practical Floriculture," it would look as though the "professor" was going through the book. Of course the *News* will put a stop to these antics, and relegate J. N. B. to the obscurity from which he has temporarily emerged.

Bee Notes.

BY M. QUINBY.

Twenty-five years ago I bought honey in several parts of this county, (Montgomery, N. Y.). Box hives were then used, and the average yield was not over ten pounds per hive. A man in the southern part of Herkimer Co., N. Y., had the past season the care of 175 hives, from which he obtained over 17,000 lbs. surplus. Another man, not far from the Central R. R., in the same county, started with 102 stocks in the spring, and obtained from them over 10,000 lbs. surplus. Other parties, with smaller numbers, have succeeded as well. I mention these circumstances to show that we have gained something in our knowledge of bee-keeping. Here is an average of about 100 lbs. per hive, instead of 10 lbs. Allow me to state what one person obtained the past summer, in extracting from one hive in about two months. Bees worked very slowly early in the season; fruit-tree blossoms and clover yielded but little, and the bees did not gather freely until the last of June.

June 29th he got only 5 lbs.	Aug. 1st the yield was 65 lbs.
July 4th the yield was 11 "	" 5th " " 72 "
" 8th " " 30 "	" 8th " " 46 "
" 16th " " 31 "	" 11th " " 62 "
" 23d " " 58 "	" 17th " " 43 "
" 25th " " 57 "	" 26th " " 37 "
" 29th " " 65 "	
Total.....	582 lbs.

All of this, except 80 lbs., was white honey. This case would indicate that there was a gain in frequent extracting, and furnishing as many empty combs as the bees could occupy. The dry pleasant weather of September, was more favorable for the secretion of honey than usual. Some colonies have obtained almost enough for winter, from the asters and golden rods. I have heard of but one man whose bees have added honey to his unfinished boxes from these flowers, and it seldom occurs in this section. The slovenly farmer, who suffers these weeds to mature, may feel that he has contributed something to the sweets of life.... It is presumed that all bees destined for winter, are in proper order at this time. For all localities above the latitude of New York City, bees winter safest in the house. If there is no warm, dark room, proportioned in size to the number of bees to be wintered, prepare one at once. If a place is arranged in the cellar, let it, if possible, be directly under the living room, where there is a fire, or adjoining a room with a fire. If the cellar contains a furnace, let a close partition separate the bees from it. Let them be disturbed as little as possible. In carrying them in, let it be done so quietly that they will know nothing of it. Provide a thermometer that you may know the temperature of the room. If you can keep it at 45° there will be little risk in ventilating, whether from the bottom or top, very little will do.... A word now in regard to the idea that bees are guilty of depredations on grapes and other fruit. I hope those who have made these accusations, have made further observations this fall. The weather has been so warm and fine, that the bees have been less eager for the juices of fruit than usual. I noticed—particularly on Concord and Delaware grapes—a strip of skin near an eighth of an inch broad, peeled off half around the grape, leaving the pulp exposed, and as far as I could see, unmolested by bees or wasps. No sane man will suppose that bees will leave the hive before sunrise, do this mischief, and return without being seen. Now whoever has noticed these things this fall—and I hope some have been sufficiently interested to do so—will do the public a great favor to report accurately what he has seen. According to observation, after the exposure of the peeled grape a few days, the bees discovered the tempting morsel, and sucked them nearly dry. In the cool spell of weather, which occurred the first of October, when the bees did not fly at all, I noticed grapes damaged

in the same way. The question now arises, what begins the mischief,—it is evidently not the bees. Will some one help find out? Most of the grapes injured, were perhaps 60 rods from the house. Others of the same kind, were in the garden, and near it. Very few were molested near the house, while those further off suffered greatly—another proof that bees are innocent. I once suspected the robin, but I did not see one during the month of September. Mice might do it, as clusters of grapes that hung over the wooden bars of the trellis, were molested the most. Will not some one set a trap and catch something. Let us have facts to depend upon, and not be obliged to guess.

Ogden Farm Papers.—No. 57

"I am a young man, married, and have been for several years out of health, so that I have been unable to pursue my vocation of book-keeping. I have recently settled in a healthy mountain region in the South, and need some means for my support. I am without capital, but I can borrow a few hundred dollars. If I can hire a place that I want, how would it do for me to buy six cows? I can readily sell their milk at 30 cents per gallon. Six cows cost—say \$40 each—\$240; 2 gallons milk each day, for 30 days, at 30 cents per gallon—\$108; 14 lbs. of hay, and 12 lbs. of meal per day, each—2,520 lbs. of hay, and 2,160 lbs. of meal per month. Hay is worth \$15 per ton, and meal is \$20 per ton. This will cost per month—say \$40.60. A man's wages and board—say \$14. This will leave me about \$50 per month, which would make me independent. I would like to have your advice." What is one to do in such a case as this? How can one give any advice that will not seem hardhearted? Probably there would be few shorter roads to the entire loss of whatever might be borrowed for this purpose, than the course laid out by my correspondent. If he were a laboring man, and were able to take care of a cow, and to milk her himself, and to carry the milk to his customers, he might, perhaps, by beginning in a small way, make his subsistence, and become comfortable in time. But here is a man, unable to work, and having no practical knowledge of cattle, setting down and deluding himself with the hope that he would be able to make an independent living on borrowed capital and hired labor, where a laboring man, having much less expense, would find it difficult to get along. These agricultural computations are the most deceptive things in the world. 8 quarts per day as an average, is 2,920 quarts per annum, which is pretty nearly twice the average product of the good dairy regions of New York State. With such cattle as one would find at the South, fed and cared for as they probably would be, the estimate is most extravagant. Then, what sort of care would six cows receive at the hands of a Southern negro, whose wages and subsistence would cost less than 50 cents per diem.

In fact, the whole proposition, were it not seriously made by a suffering and hopeful man, would be ridiculous. As it is, it is only very sad; and it would not merit notice here, were it not for the fact, that there are all over the country—and perhaps largely among the readers of the *Agriculturist*—thousands of men whose hope for success in life is turned away from employments which they understand, and for which they are qualified, and centered upon an intricate and difficult occupation, which requires more skill, patience, endurance, strength, and judgment, than almost any other within the whole range of human industries. It is another instance of farming upon paper,

than which nothing can be more delusive. Agriculture can do much; it has its possibilities, and opens a certain future for those who rightly apply themselves to its prosecution; but it is very far from being what its more enthusiastic and infatuated (and less experienced) admirers think it to be. In this case, as in many others, I am quite incapable of advising my friend what to do; but it is the easiest and safest thing in the world to advise him not to do what he proposes.

It may be remembered by some of my readers, that I last year paid \$200 rent for 2 acres of clover, a part of which we used for soiling, and another part made into hay. This same field was offered to me this year, but I declined it, because I did not believe that it would again produce an abundant crop of clover. The owner said he would convince me, that with liberal top-dressings of seaweed and stable manure, it could be made to do so. It received last winter such a manuring as falls to the lot of few farm fields, and it is now (September 15th) covered with a heavy after-growth, in which the clover is conspicuous and uniform. It has been mown twice for hay, and the whole crop has passed over my hay-scales, and is recorded on my weighing-book. The first cutting was June 20th. The grass was more than half clover, the rest being timothy; it was not so well dried as it should have been, and although safely stored in a barn, it is somewhat injured from heating; at the same time, it was not so wet but that it has kept, and it is now in fair condition for fodder. The amount weighed, was a little over 8 tons—I assume that properly cured, it would have weighed 6 tons. The second cutting was made August 10th, and the crop, thoroughly cured and in the best condition for storing, weighed 336 lbs. more than 4 tons. The whole of both cuttings was at the least calculation, equal to fully 5 tons of well cured hay per acre. Comment upon this statement is unnecessary.

In a recent number I gave an account of a man calling himself an agricultural chemist, who went about our island analyzing soils by tasting, and prescribing different manurial amendments, by which their "latent fertility" might be developed. We number among our farmers many hard-headed, sensible men, of considerable property, who flatter themselves that their eye-teeth were cut long ago, and that they are not to be caught with chaff. Had any one had the temerity to advise them to apply to a thoroughly scientific man, like Prof. Johnson of Yale College, for advice as to the treatment of their particular soils, he would probably have been hooted and sneered out of the community for a "book-farmer." Had Prof. Johnson been applied to to give advice based on soil analyses, he would have replied that it lies entirely beyond the reach of any science, to render valuable aid in this way. Yet, here comes an arrant quack, who captures one substantial farmer after another, and convinces him that he can, for a consideration, show him the short cut to agricultural wealth. So far as I can learn, his willing victims in this county may be numbered by scores, if not by hundreds, and they include men who pass for the most sensible among us, but who, like the rest of the world, evidently like to be humbugged. One, a near neighbor, took this "chemist" to two fields, which have been cultivated for several years as a market garden. He duly tasted and advised, and here is his advice: (Copied literal-

ly from his pencil note, on a dirty half-sheet of note paper.)

" Pond lot.	1 barrel loam.	10 lbs.
" Lawns.		Soda Ash.
		10 lbs.
		Lime.
		5 lbs.
		Copperas.
		5 quarts.
		Salt.
		2 lbs.
		Chloride of Lime.
" Soda ash and Lime slacked together.—Dry Slack.		
" Pound the Copperas.		

" Rest of land,	1 barrel loam.	
6 lbs. Soda Ash.		
6 lbs. Lime.		Slack lime,
4 qts. Salt.		and
3 lbs. Copperas.		Pound Soda Ash.
4 lbs. Caustic Soda."		

His fee for this valuable service, was \$40. Comment is again unnecessary.

I have received a long printed report of an experiment with the Deep Can System, made by the Solebury Farmers' Club, in Bucks Co., Penn. A committee was appointed to examine and experiment in setting milk, both deep and shallow, at the farm of a Mr. Reeder. I do not clearly understand the arrangement of the patent apparatus, by which the water in the pool was kept cool by ice water, but so far as one can judge, the trial seems to have been a fair one, so far as the experimenters could make it so.

"The trial commenced on Monday morning, August 10th, 1874. On account of scarcity of milk in the mornings, but 8 gallons were used at a time during the trial. Four gallons of measured milk were put in one deep can, filling it just 16 inches deep, and weighing 34 pounds. The same quantity of this previously mixed milk, by weight and measure, was put in 4 ordinary tin milk pans, (4 quarts to the pan) and filling them 3 inches deep. This was repeated for 14 milkings, one week—making a total of 476 pounds, or 224 quarts of milk, 16 inches deep in 14 cans; and the same amount in 56 pans, 3 inches deep.

"The water in the pool, as before stated, was at a temperature of 58°; when a can of warm milk was immersed in it, it raised the temperature to 60°, but at the expiration of 10 or 12 hours, it would be lowered to 58° again, by the inflow of fresh ice water. A piece of ice was put in the pool after the first day, so as not to let the temperature be varied any more than could be helped. The pans of milk were set on a stone floor, where the temperature was 60°. During the whole trial the temperature ranged as follows: In the pool, from 58 to 60°; in the milk room, from 60 to 62°. Great care was taken to preserve this uniform temperature during the whole trial, by admitting cool air at night, and excluding the warm air during the day, which necessary feature is under complete control. The milk in both cans and pans stood 48 hours, when it was skimmed. The cream raised one inch in depth in the deep cans. The amount of cream obtained from the deep cans was 46 pounds, from the shallow pans 57 pounds. The last skimming was done on Tuesday evening, August 18th, when the cream was placed in a cooling cupboard, and the temperature lowered to 54°. The churning was done Wednesday, August 19th. The 46 pounds of cream obtained from the deep cans, was churned first—butter came in 30 minutes, and yielded 15 pounds 10 ounces. The cream from the shallow pans (57 pounds) was churned immediately afterwards—butter came in 50 minutes, and yielded 21 pounds 6 ounces. The result of this experiment, which was conducted as fairly as possible, indicates a gain of 5 ²/₁₆ pounds in favor of the shallow pans, or over 25 per cent."

I am entirely at a loss to account for this result, nor have I any equally careful experiment to set against it. At the same time, I am quite satisfied that were the facts known, there would be found some good reason for questioning its value. Before we settled upon the Deep Can System ourselves, we made alternate trials, week and week about, with the deep and shallow setting. We invariably got a trifle more butter from the deep than from the shallow, the herd being the same, and getting the same treatment, slightly more, but not enough more to be of consequence. The improvement that we found was in quality; in a great saving of labor, and especially in a greater uniformity, without regard to the temperature of the air. Since that time, some three years ago, we have entirely abandoned shallow setting, and remained more than satisfied with our deep cans. Surely if there had been anything like the difference in quantity, which the Solebury experiment developed, we could not have failed to detect it, and should certainly have abandoned the system. Had the quantity of cream obtained at Solebury been larger in case of the deep can setting, I confess I should have been somewhat staggered by the difference in the amount of butter, but if anything is determined beyond question, not only by my own experience, but by that of others pursuing the same course, it is that, whatever may be the amount of butter produced, the amount of cream is universally much larger, a fact which is undoubtedly due to the less exposure of the cream to the drying effect of the air. Cream taken from a shallow pan, set for even 36 hours, is almost universally somewhat clotted and leathery from its drying, while that taken from deep cans, is always thin and fluid, showing greater content of water, and being therefore much more in quantity.

So long as milk remains fluid, (free from coagulation), and so long as the particles of cream are lighter than the particles of milk, as they always are, these must inevitably rise, even if set eighteen feet deep instead of eighteen inches, and we find not only a very large amount of cream separated, even in 24 hours standing, but also the peculiar blue look, which only thoroughly de creamed milk can have; and, after skimming, the milk returned to the pool, in order to avoid curdling, never raises any sensible amount of cream; it is in fact thorough skimmed milk.

I have no intention of entering into a discussion on this subject, for the reason that not living at the farm, and not being able to give constant personal attention to the details, I could not make an experiment for which I would be willing to vouch. I have stated Mr. Reeder's case in his own words, and must leave my readers to draw their own conclusions, and make their own investigations, but I shall not, myself, be led by the disastrous results he sets forth, to change my present system; feeling confident, that were his water pool like mine, and his milk and his processes like mine, he would find the result entirely different from that which his own experiment has developed. Since our dairy was established on its present basis, we have never, in the coldest or in the hottest weather, had the least difficulty in making butter of uniformly good quality, and entirely acceptable to our over-particular customers.

We are all of us the better now and then for intelligent criticism, and, although I have had differences with Mr. William Crozier, of the Beacon Stock-Farm, on the subject of the

amount of butter which a large herd of cows may be made to yield; I have always been ready to concede to him the merit of being a thoroughly good, practical farmer, and have regretted, more than once, my inability to study his practical operations. He has recently visited Ogden Farm, during my absence, and writes me the following:

"I was well satisfied with my visit. We ate of your butter, which is delicious, but I do not like your way of making it as I do my own. I always think more of our little dairy, than any I have seen, although your method of heating is superior to mine, and I will adopt your plan. Your barn is a good one—the best I have seen—although the open spaces behind the cows must be very bad. In winter there must be a furious draught in it. Your crops of potatoes and turnips are not up to mine. Nor is your plowing. Please adopt better cultivation throughout, as there are many looking toward you for their education. Your stock bull I think is splendid in every respect, although I would like a lighter color. Your calves tempt me to offer for 3 of them \$100, each, [he picked out my best three, for which I ask \$175, each.] Your cows I must congratulate you on; they are the best throughout that I have seen, that is, for so many, far better than I expected from hearing from your visitors—which makes me think visitors often do not know what they are talking about. I was much pleased with my visit, and trust you will excuse me for writing you the impressions your farm made on me throughout. I hope you will put on your farm better plows, and bigger horses, and employ better plowmen, and not let the face of a weed be seen on the O. F."

To be entirely frank, I fear we are more open to Mr. Crozier's rebuke, than entitled to his compliments. However, as we only plow about 8 acres a year, and as deep plowing is not suited to our soil. I fear it would hardly pay us to make the radical change he suggests; we must also plead guilty to the weeds he hints at—the more shame to us—the land is rich, and while its natural tendency to grass keeps our meadows clean, we do have more rag-weed in our fodder corn than is respectable, and I have as yet been able to devise no way to get rid of it profitably. I do not like our open barn-floor, and should not repeat it if we were to build anew, but as the cellar is closed bottle-tight in winter, we have no perceptible draught.

On the whole, perhaps because I realize more thoroughly than a casual visitor does, what our drawbacks are, I am glad to have been let off with so mild a criticism.

An enthusiastic farmer in Mass., says: "There ought to be millions more sheep in New England than there are to-day. I believe it is the most economical, and only practicable means of restoring the fertility of the soil. Why does every English farmer think sheep husbandry a necessary part of his plans? and wherein are we in New England differently situated? I would like to see that inquiry answered by you in print. The objections are dogs and fences."

Probably the true reason for the neglect of sheep complained of, and one that is much more effective than dogs and fences, is the very important one of Custom. English farmers keep sheep very largely because they have the habit of keeping them; our farmers in New England have never been in the practice of keeping them to any very great extent. The dog and fence difficulty is quite as prominent

in England as here, perhaps the fences are on the whole better, but the dogs are, if anything, worse, and a large proportion of the flocks are kept on outlying land, where fences and dog laws are almost unknown.

Probably the reason why we do not keep sheep more extensively than we do, is because we have not learned how important they are, and how easily they may be kept in a systematic way and under proper care. In the more highly farmed parts of England, where, as everywhere else, sheep are considered indispensable, hurdles are largely used, and the flocks are sufficiently large for the services of a shepherd to be profitably employed. The best services that could be rendered toward the encouragement of keeping sheep here, would be by beginning with the recommendation of hurdles. The hurdle is the true missionary for the dissemination of the sheep keeping doctrine; with its aid sheep are easily confined to small areas, which they thoroughly depasture, and are with little labor moved to fresh ground. In this way do we not only insure the uniform feeding of the land, but we have placed within our reach the very best means for the equal distribution of manure, the sheep being fed with grain or other food not grown upon the land to which they are confined.

Hurdles in England are usually made of rough poles, scarcely larger than stout bean-poles, often tied together with willow withes, and so light that they are easily handled. Their cost is slight, and the labor of removing them is but trifling.

How to Build a Snow-Plow.

The snow-plow here illustrated is built so as to be fixed upon the forward part of a double sled. The frame is made of 4x4 oak scantling, and is similar in form to a double mold-board plow. One runner is fixed to the forward part, at such a distance below the edge of the plow as to raise it to clear obstacles such as stones or frozen mud which may be in its way. Four inches would probably in general be a safe distance. The hinder part of the plow rests upon the sled as shown in the engraving,

MANNER OF MAKING A SNOW-PLOW.

and is bolted to it. A long tongue is fixed into the place of the ordinary one, and is fastened to the front of the plow by an iron strap, which is bolted to the frame. The hinder portion of the plow may be covered over with boards, and a seat fixed firmly upon it. When it is used, it is best to load it as much as possible. The sides of the plow are made of half-inch oak or basswood strips, steamed and bent into shape. The outer surface of these strips

should be dressed smoothly, which will make the draft easier.

The Emptying of Water Stored for Irrigation.

There are many small streams which might be used for irrigation, were it not that their volume is so slight that their water would have too little force and volume to cover any considerable extent of land. In countries where

OUTLET TO A DAM.

irrigation is largely practiced, such streams are not allowed to lie idle, but their water is stored up until enough has accumulated to overflow the land with good effect. The contrivance adopted for this is very simple and inexpensive, and might easily be applied to many circumstances existing in America. The accompanying illustration will show the arrangement. A portion of the bank or dam, by which the water is held back is shown. Leading through the bottom of it is a pipe L, properly protected by a grating at its upper end, which serves to empty it from time to time. The mouth of this pipe at M, is closed with an india rubber ball, or some similar device, fitting its orifice, and fastened to a board I, which stands vertically in front of it, being hinged at K. This board is held in its vertical position by EF, the end E, being formed in the shape of a basin, capable of holding a considerable quantity of water, and the end F, having a counterpoise of stone or wood sufficient to return it to its horizontal position when it has been tilted.

Through the upper part of the dam is placed the pipe C, also protected with a grating at B. The end of the pipe D discharges into E. When this is filled, it becomes heavier than the counterpoise H, and is tilted, withdrawing its support from the board I, which is forced back by the pressure of the water in the pipe L, and is held out of the way so long as the stream through L has sufficient velocity to counteract the force of the counterpoise. When the pond or reservoir is emptied—that is,

when the stream through L has stopped flowing,—the counterpoise raises E, and forces the board I back to its place, and stops the mouth of the pipe. To prevent water flowing over the dam, in case of any disarrangement of the apparatus, the pipe leading from B has a second opening on the face of the dam.

By this arrangement the small amount of water at command is collected until its quantity is sufficient to irrigate the whole field.

Ayrshire and Native Cows Compared.

Dr. E. Lewis Sturtevant, of Waushakum, Ct., favors us with the following statement of the comparative yields of pure-bred Ayrshires and a picked herd of native cows, which shows a great difference in favor of the Ayrshire cows, bred especially with reference to a large yield of milk for many years:

The proprietors of Waushakum Farm entered into the raising of milk in the summer and fall of 1866, with the idea that the most profitable stock to keep would be the highest class of grade, or so-called native cows. The best were accordingly purchased, without regard to price, and fed high, in order to develop the best results in milk, and also that the animals, when dry,

or in case of accident, could be quickly prepared for the shambles. In 1868, hearing so much said in favor of thoroughbreds, we concluded to experiment on a small scale; so during this year we had two Jersey and four Ayrshire cows on our premises. In 1869 we had become so well convinced that the Ayrshire breed would be the most profitable for our uses, that in December, 1869, eight cows in calf were procured from Scotland. A few other imported cows purchased at low prices on this side, and the progeny of imported cows, constitute our present herd. As a careful system of accounts has now been kept with each cow in our possession, giving the daily yield of milk in pounds since 1866, we are enabled to present a few facts relating to a herd kept during seven years; and these facts show the effect of a change in breed; not clearly, however, for the natives were old cows in their prime and fed especially for milk: the Ayrshires, a breeding stock, including heifers in milk, and fed with reference to their healthfulness and durability as a breed. During these seven years we have a record of 68 annual yields from 34 different native cows, and 63 annual yields from 18 different Ayrshire cows. Total of the 68 native yields, 324,723 lbs., or per cow, 4,775 lbs.;

total of the 62 Ayrshire yields, 329,160 lbs., or per cow, 5,309 lbs.; difference in favor of Ayrshires, 534 lbs. for each cow. The 34 native cows were the best of 50 owned during this time; the 18 Ayrshire cows include every one that was owned during these years. Separating the

ten best Ayrshires, selected from 18 cows, gave an annual average of 7,317 lbs. Of 62 Ayrshire yields, 19.3 per cent were over 6,500 lbs.; 40.3 per cent over 6,000 lbs. Of 68 native yields, 11.8 per cent were over 6,500 lbs.; 16.3 per cent over 6,000 lbs. If the Ayrshire heifers are left

out of the consideration, we have the comparison between native cows in each case, and a new summary. Native yield, 4,775 lbs. per cow; Ayrshire, 5,571 lbs. per cow. A difference in favor of the thoroughbred of 796 lbs., instead of 534. The percentages will also be changed as follows: Yields over 6,000 lbs.: Ayrshires, 42.8 per cent; natives, 16.3 per cent. Yield over 6,500 lbs.: Ayrshires, 21.4 per cent; natives, 11.8 per cent. I trust these figures are sufficiently in detail for the purpose of comparison, and may be of interest.

The two cows whose portraits are given herewith, are members of this herd. Lady Kilbournie was purchased in December 1871, and her yield of milk up to August, 1874, was as follows: in 1872, 7,429 lbs.; in 1873, 7,124 lbs.; in April, 1874, she calved, and in August of this year she gave 1,097½ lbs. Her highest yield was in June, 1873, when newly calved, giving 1,338 lbs. in that month. This cow weighs about 850 lbs.—Georgia has been in the herd since June, 1871. Her yield in 1872 was 7,127 lbs.; in 1873, 6,094 lbs.; and when fresh in August last, gave 1,417 lbs. in that month. Since June, 1871, up to the present time, she has given milk continually, excepting in July, 1873. In June, 1873, she gave 110 lbs. of milk, calved, and in July gave 955 lbs. Her weight is about 890 lbs. These yields are not given as being anything wonderful, but as those of a working herd in ordinary condition, and yielding milk for profit. They show sufficiently that the extra cost of a pure bred animal is well repaid in her more valuable produce not only of milk, but in her progeny, as each of her calves at maturity should be worth much more than the best native cow. This extra value is easily calculated.

AYRSHIRE COW "LADY KILBOURNIE."

period of seven years into two portions, we have for the "native years" 1867-8-9, an average yield of 4,603 lbs. for each cow; for the Ayrshires, 1870-1-2-3, an average of 5,623 lbs. per cow. A difference in favor of the Ayrshires of 1,020 lbs. Taking the best average year for each class, we had best average for any one year, for natives, 4,834 lbs.; for Ayrshires, 6,047 lbs., or 1,213 lbs. in favor of the Ayrshires. Average daily yield, per year, while in milk: natives, 15.7 lbs.; Ayrshires, 19.0 lbs.; a difference of 3.3 lbs. a day. Aver-

AYRSHIRE COW "GEORGIA."

age daily yield of each cow, each year, for the whole year: natives, 12.5 lbs.; Ayrshires, 15.5 lbs.; difference in favor of Ayrshires, 1,095 lbs. yearly. The ten best natives, selected from 50 cows, gave an annual average of 6,943 lbs.; the

Walks and Talks on the Farm.—No. 131.

Yesterday I got a letter from a gentleman in New South Wales. He said he was a reader of the *American Agriculturist* and wanted to know if I could send him some pigs. "I imagine," he said, "that I could get some pigs by mail!"—I noticed sometime ago that a scientific gentleman proposed to put pigs to sleep in the fall and let them lie dormant during the winter, waking up in the spring in time to go out to fresh grass in the pastures. Perhaps this Australian gentleman has a similar idea. We could take a young pig, weighing say 30 lbs., put him to sleep, pack him carefully in a neat box, put the necessary postage stamps on it, and in a few minutes he would be on his way to San Francisco. The Post Office Department carry live bulbs to any part of the United States for 8 cents per lb.—Why not live pigs? ["Why not," to be sure—not the least objection in the world, only it is just possible that your Australian friend might object to having even an Essex in 4-lb. junks, as that is the greatest amount the law allows to go in one parcel.—Ed.]

It is hard for a plain, slow-going farmer like me to realize what an age we live in, I can recollect taking my first journey on a stage coach thirty miles from home. I thought I was a great traveler. Some time ago I was going from Rochester to Utica. There was a little girl going about the car and evidently well acquainted with several of the passengers. I spoke to her as she passed. "Have you come far on the cars?" I asked. "Oh, no, sir," she replied. "I have not come far on the cars. I only came from San Francisco on the cars. I came from Yokohama on the steamer."

When Charles Collings wished to show what improvements he had made in Durham cattle, he fattened an ox which was then put on a carriage and drawn from town to town for exhibition. He is spoken of in Short-horn annuals as the "Durham ox that traveled." What would a Texan steer say to his pretensions as a traveler?

If in these days a farmer makes any real improvement in seeds, vegetables, or animals, the fact is mentioned in the agricultural papers, and it is soon known throughout the world. Young men are apt to think that all the great discoveries have been made, that there is now no chance for further invention or improvement. It is a great mistake. There never was, at any rate in agriculture, so many opportunities for acquiring reputation, honor, and remuneration, as at the present time. Let young men bestir themselves.

The severe drouth has seriously checked the growth of the mangels—and I am trying to console myself with the reflection that small, well-matured roots, are more nutritious than large, over-grown immature ones. I sowed the field at different times, for two reasons. First, because it was a good deal of work to get the land in proper condition, and I thought that the earlier I could sow the better, and that if I waited till the whole field was well prepared, it would be getting late; and, second, I thought it would be better not to sow all at one time, and thus give me a dozen or more acres that would all want hoeing at once. I drilled in my oats and peas, April 22; barley, April 30, and the first mangels May 2. The last sowing was two weeks later. The earlier sowings came up far thicker and the plants

were stronger and grew better. And, furthermore, the weeds were not so numerous, and it was far less work hoeing. Everything seemed strongly favorable to early sowing. But during the severe drouth in August, the late sown began to catch up, and by the middle of September, the drouth still continuing, the roots were decidedly larger and the leaves more luxuriant. I know of no reason for this except that the land that was sown late got an extra plowing. At first the late crop was so full of weeds that I thought that it would cost more to clean it than it was worth.

During the drouth, those farmers who had a good patch of corn fodder got full pay for their labor. In five cases out of six, however, farmers in this neighborhood sow their fodder corn broadcast, and in a dry season, when the green fodder would be of most value, the crop is burnt up. There is no fact more clearly proved, I think, than that corn for fodder should be drilled in rows, and the land kept clean and mellow by the frequent use of the cultivator.

I wish the butchers and drovers in New York or Chicago would get up a Fat Cattle Show to be held every year in December. I do not see why it could not be made as interesting and useful as the great Smithfield Club Cattle Show in London. The meat supply of New York and New England comes largely from Illinois and States west of the Mississippi. Between New York and Chicago there are millions of acres of land under cultivation that are not producing more than half a crop. Depend upon it, this land is not going to be abandoned. I think the agriculture of this section is steadily improving. We are cultivating our land more thoroughly. Many of our farmers are using artificial manures, and not a few are endeavoring to enrich their land by keeping more stock and buying more or less food, and thus making more manure. To keep more stock for beef, mutton, and pork, is at present a cheaper method of enriching our land than to buy artificial manures. We must, however, raise better stock and furnish meat of extra quality, or we cannot compete with the cheap corn-growing sections of the West. Our markets are flooded with cheap beef and mutton. It is wretched stuff—unprofitable to the producers, and still more unprofitable to consumers. Let the butchers of New York tell us what they want. Let us have a good show of animals ready for the shambles, and let the judges decide what breeds or grades are best, and we shall know where we stand. If New York is willing to pay for good meat—and it is—we should soon learn how to produce precisely what is wanted. Let us have a good show. Let the prizes be awarded and the animals be sold to the butchers, and let consumers and producers meet together and study the facts which will in this way be brought to light.

"What did you see at the State Fair?" asks the Deacon. "I saw a good many old friends, and this to me is one of the pleasantest and most profitable feature of these annual gatherings."—More than a dozen people asked me "How's the Deacon?"—And one day I went into the General Superintendent's office. I saw no one there who knew me, as I supposed, and I told the young man in charge that I was an exhibitor and wanted a couple of tickets for my men. "Here they are," he replied promptly and politely, "and if you will bring the

Deacon along I will give you one for him." I could not persuade the old gentleman to come. But he was none the less interested in talking over all that occurred. "I see you got some prizes for your sheep and pigs," he remarked, "but I hear there was not much competition."—"I got the first prize for white winter wheat," I replied, "with the Diehl in competition with the Clawson—and this pleased me. I also got the first prize for six-rowed barley and the first for mangel-wurzel."—I had twenty-four entries and took twenty-three prizes. I got \$208 in prizes at the State Fair, and \$64 at the Western New York, which was held at the same time. I got the first prize for everything I showed at the Western New York Fair. I mention this in no boastful feeling. I am simply tired of hearing farmers (who don't take an agricultural paper) sneer at editors and writers. We are not the humbugs and ignoramuses these men imagine us to be. I can always tell in talking to a farmer whether he takes the *Agriculturist* or not. If he does he has some suggestion to make that is often of use to me, or he asks an intelligent question. The other man seems to think I "farm on paper," that I was born with a silver spoon in my mouth and no brains in my head; that I discard barn-yard manure and depend on guano; that I feed my pigs on plum cake and wash them with rose water. And when he finds that I plow, and sow, and harrow, and cultivate as other farmers do, he thinks I am certainly a humbug—because I am not what he expected me to be.

I got one new idea at the Fair from Carl Heyne. He asked me to come and see his Silesian Merino lambs. They were splendid—large, well-formed, and completely covered with long, thick, fine wool. "But, Carl," I said, "these can't be lambs. They are almost as heavy as my Cotswold lambs. They must be yearlings."—"No," he said, shaking his head and smiling. "Lambs."—"They must have come very early," I replied. He smiled and nodded his head. "February?" I queried. Another smile. "January?" Another smile. "December?" Another smile. I have smiled to myself several times since as I thought over the matter. If I had said "November," I presume he would have smiled assent, and I am not sure if I should not have got the same response if I had said "October" or "September." I suppose a lamb is a "lamb" till it is sheared, then it becomes a "shearling." "Is it well," I asked, "to have lambs come so early?"—"Better," he replied. "We have plenty of hay and roots and can feed the ewes well in winter. In the spring the weather is wet and the grass watery and poor, and young lambs do not thrive on it. If the lambs come early they can be well fed and cared for all winter and spring, and by the time the grass is rich and abundant they are ready for it."

All this, at first sight, seems quite unnatural. But few of the processes of agriculture are natural. It is not natural to milk a cow or shear a sheep, or make hay, or provide shelter and supply the wants and look to the comforts of our stock. We find no objection to have cows calve in September. Why may it not be quite as well to have our lambs come in the fall? "I have always found lambs that come accidentally in the winter," said the Deacon, "a nuisance."—"Yes," said the Squire, "it is best to knock them on the head at once and have done with it. It is all well enough for you amateurs who keep a few pet sheep and like to

fuss over them, but it won't do for a farmer who keeps a large flock."—"But," I replied, "Carl Heyne is one of the most experienced shepherds in the United States. He has charge of a flock of over 800 sheep, and is celebrated for his successful management. When such a man says it is better to have lambs come in the fall or early winter—and practices what he preaches—the matter is worthy of consideration and discussion."—"For my part I am half converted already, provided the ewes can be induced to fall in with the idea. I suppose this matter can be brought about by feeding, weaning, etc.

The Holstein cattle this year, as last, attracted much attention. We cannot have too many good breeds in this country. There is room and place for all of them—from the diminutive Kerry and deer-like Jersey to the noble Shorthorn and Holstein. There was a better show of Herefords than we have had for some years. There was rather a small show of Jerseys and Devons, but some capital animals amongst them. Charles and James N. Wadsworth, of Geneseo, and George Butts, of Manlius, made a grand show of Shorthorns. The Ayrshires are steadily gaining favor in the dairy districts, and there was a large display. "I suppose," said the Deacon, "the Ayrshires give a great mess of milk, but it is not as good for butter as that from one of our common cows."—"Perhaps not," I replied, "but farmers who take their milk to a churn or butter factory want quantity, and so do milkmen, and even you and I, who keep our milk at home, like to see our cows fill the pail. But after all, the question is not which is the best breed in itself considered, but which gives us the best animals for our purpose, when crossed with such stock as we now have on our farms. The cow "Old Creamer," which attracted so much notice at the New York State Fair, at Albany, last year, was a grade Ayrshire—not a thoroughbred. During the month of June she averaged over 40 quarts of milk per day."—"I once heard of an Ayrshire cow," said the Deacon, "that took the prize at the State Fair. The owner gave the necessary affidavits as to the amount of milk produced (which was quite extraordinary), and also that she had received no grain, bran, oilcake, etc., but had run in a pasture, which, I presume he said was a poor one! After the prize was awarded, the fact was proved that during the trial month she had drank the new milk from two other cows!"

In sheep there was nothing new or remarkable. The Shropshire Downs are holding their own remarkably well. The South Downs are receiving less care in breeding than formerly. The best stock of England was brought here, but our flocks seem to have degenerated. It is not an easy matter to keep our sheep up to the English standard. The English breeders feed more roots in winter, and their summers are not so hot, and besides this, we keep our breeds pure, while I doubt if this can be said of many of the English breeders of sheep and swine. We often hear of "improved" Cotswolds, or "improved" Leicesters, or "improved" Berkshires—which I suppose simply means that they have been crossed with some other breed. Bring this "improved" stock here and keep it pure, and it will inevitably degenerate. It is easier to *make* an improvement than to keep it."

The man who gets a good deal of the garb-

age from the city of Rochester to feed pigs, was here the other day. He keeps 200 pigs, breeding some and buying others. He is getting 10 cents per lb. for dressed pigs, and is making money. "My wife," he said, "wants me to buy some of your pigs."—"She is a sensible woman," I remarked. I knew very well that he would not buy any, but I thought I would see what he would say. He selected one, a four-months-old pig. "What will you take for this little pig?" he asked. "Thirty dollars."—"Thirty dollars?" he exclaimed, "my wife would pull my hair."—"You can have him, then, for \$25."—"It is 50 cents a lb.," he said. "I'll take 40 cents."—"Will you take 30 cents," he asked. "Yes."—"I will give you 25 cents per lb.," he said. "Put him on the scales, boys," I replied, "you can have him." The scales were carefully adjusted and the man weighed the pig himself. "Ninety-two and a half lbs.," he said. "You feed them so high, they weigh like lead." I thought, for once, I had sold him a pig, but I was mistaken. "I'll give you \$30 for a pair," he said, "and that's a big price for four-months'-old pigs." He goes to Buffalo and buys Western pigs, a year old and over, for \$5 or \$6 each. They are large-framed hogs, weighing about 100 lbs. each. I presume this pays *him* better than buying a four or five months' pig of the same weight at the same price per pound, but I do not see how those who raise and feed such pigs until a year old, can make anything. The pen of five pigs, four months old, that I showed at the State Fair, weighed 493 lbs. The pen of five, a week or so less than six months old, averaged about 200 lbs. each. These are the "small breed." These six months pigs will not shrink in dressing over 12 per cent. In other words they would dress 175 lbs. These year-old pigs that weigh above 100 lbs. would shrink 40 per cent. They would give 60 lbs. of carcass—and such a carcass! After the bones, skin, ears, nose, and feet were taken out, how much pork would there be left, as the result of a year's feeding? I presume these pigs got their living from the mother until two months old. If killed then, there would probably have been as much available food in them as there is now, and of far better quality. All we have got for ten months' feeding is a certain quantity of bone and digestive apparatus. There are some thirty millions of pigs in the United States. A little more care in breeding and feeding would easily add five dollars to the value of each pig. This would give us more money than we receive for all the wheat, corn, and other grain that we export to foreign countries. I hope and believe the time is not far distant when not a bushel of wheat or corn will leave our shores. We ought to raise all our own wool, and supply the world with pork, bacon, hams, and lard. To ship a car-load of thin hogs from Iowa to Buffalo, and send four car-loads of corn along with them to fatten them here, paying freight and commission on both, is poor policy. To ship corn to Ireland to make pork and bacon for the English market, is equally unwise. Better feed out our corn at home, and learn to furnish the bacon, hams, and lard, which the foreign market demands.

There will be thousands of bushels of American wheat fed out to English pigs and cattle the coming winter. Our millers and grain speculators think we have got such a large surplus of wheat, that they can get it at their own price. I tell them that the corn and oat crops are a failure, and that at the present and pros-

pective price of pork, the Western farmers can well afford to feed their wheat at home to the hogs, and I hope they will do it, rather than let all the profits go to the railroads.

How To Make a Stack Bottom.

The stability of a stack depends greatly upon how the foundation is made. If badly built, the stack will settle irregularly, lean over to one side or other, and when once out of shape it is no longer weather proof. Instead of the water being shed by the covering which has an equal slope in all parts, it is retained in hollows, or obstructed by ridges, and penetrates the interior, and damage results. Although these remarks are too late to apply to the stacking of hay or corn stalks, they are timely as regards straw, and will be worth remembering next season, when hay, grain, or fodder is to be stacked. When making a stack the ground selected should be high and dry, and if it is necessary to make the stack in a low

FORMING THE BOTTOM OF A STACK.

place, a frame of posts and poles should be made high enough to raise the bottom of the stack out of danger from water or dampness. In either case the foundation of the stack should be made of coarse waste material, and of a perfectly regular shape. If the stack is to be a square one, the bottom should be accurately laid out by measure. If it is to be a round one this is not so readily done. A round stack is not so easily built up as a square one, nor so readily made to retain its shape. The simple contrivance shown in the illustration will enable any person to lay out the bottom in a circular shape upon which the stack may be built up regularly. After a foot of straw is laid upon the ground or upon the frame, a fork is stuck up in the center. Another fork is placed with the prongs close up against the handle of the first fork, and is moved around it so that the end of the handle marks a circle. The straw is packed closely at the edge, so as to conform to this circle, and a perfectly round foundation is thus made. As the stack is built, the builder should stand in the center which will then be packed down more firmly than the sides. The sides should be carried up straight, or with a very little spread, and should be raked down evenly to keep the round shape. As the stack settles the sides will fall down more than the center, and the stack will spread in consequence sufficiently to throw the rain drip off from the sides; and if any water should penetrate at the top, it will not remain in the center, but will work off towards the caves. On the contrary, if the stack is made so that the center settles more than the sides, the water will gather to the center and go through the stack from the top to the bottom. It will not pay now to waste anything that may be turned to use in feeding stock, and straw that

is well harvested and well stacked after thrashing, is at least as good if not better feed than late-cut hay that is badly stacked afterwards.

A Portable Food Steamer.

It is needless to say anything in favor of feeding cooked food to pigs. The economy and advantage of the practice are undisputed.

A PORTABLE STEAMER.

The only consideration is as to its convenience or practicability. Where a large number of hogs are kept, every facility will be provided for cooking as a necessity that cannot be avoided. Where a few only are kept, the outlay for an apparatus is usually too great for profit. In these cases the cheap method here illustrated may be adopted. A sheet-iron boiler is made as here shown, with a small fire-box beneath it; the smoke pipe passes through the boiler and through the water contained in it. This economizes all the heating power and requires but a very little fuel to heat the water and make steam. At the rear of the boiler is placed the

set aside to cool, and each steamer should be large enough to cook food for one day. Roots, corn, oats, or coarse meal, may be cooked in this steamer; but fine feed may be cooked in the boiler shown separately. The feed mixed with hot water is placed in the boiler. This being conical, is partly immersed in the boiling water, and the heat of the feed is thus maintained until it is thoroughly cooked. A few small fragments of coal, charcoal, rough wood or corn cobs may be used for fuel. Any tin-worker can make a steamer of this kind from the description and engraving here given. We don't know of any person who makes them, but if some enterprising mechanic would undertake it, and let people know the fact, they would doubtless be largely used.

Temporary Dam for Ice Ponds.

A correspondent wishes to make a temporary pond from which he may cut ice in the winter, and afterwards draw off the water, leaving the stream and its banks in their usual condition. This may be done by erecting a temporary dam in the following manner. Select a part of the stream where the largest space may be flooded with the shortest dam. A place where the banks slope rapidly and above which they recede from the stream should be chosen. In a direct line across this place set some strong fence posts not more than 8 feet apart. They should be set at least 4 feet deep, and bedded with lime mortar and stone or cement concrete to make them perfectly solid. If the dam is not more than 4 feet high these precautions are not necessary, but if of a greater height they will be needed to resist the pressure of the water and that of the ice when its surface is acted upon by the wind. The posts should be strongly braced—the braces being set in the same manner as the posts. These posts may remain always in their position ready for use, and will occupy very little room or occasion very little inconvenience at any time. If they can be set up in a fence row so much the better. All that is needed then is to provide some

carriage bolts, the nuts of which are exposed on the outer side of the dam. The middle panel of the dam is made of planks 8 feet long, so that when it is desired the bolts may be taken out and the planks removed one by one, and the pond drained off gradually. The other planks are made to break joints, the ends being bolted to alternate posts, which will help to strengthen the dam. The lower planks must be made to fit the surface of the ground, and should be sunk three or four inches in it, and the ground well rammed around them. If any leaks occur as the water is raised, which should be done gradually by putting in one plank of the center panel at a time, they should be stopped by throwing in sawdust, tan bark, or leaves, or swamp muck. When the whole is up, the upper plank of the middle panel should be hollowed out sufficiently to allow the waste water to escape, as is shown in the illustration. If there is any danger of the falling water washing the soil away, a sloping apron of boards should be made to receive it. A pond with a surface of half an acre frozen 6 inches thick will furnish 300 tons of ice. Where the ground is favorable, a pond of this size may easily be made at an expense of \$25, and the fixtures will not need renewing for 20 years. The main point is to be sure that the posts and braces are properly set, and that the planks fit tightly; then there will be no danger of the dam breaking or the water leaking away. If the water flows back into other fields, there is no need to remove the fences, even if they are of rails, if they are well staked and such riders as are likely to be covered with water are wired down to the top rails.

BASKET FOR GATHERING LEAVES.

Gathering Leaves.

Before the ground is covered with snow as many leaves as possible should be gathered from wood-lots and woods. Leaves are soft, warm, clean bedding, and absorb a large quantity of liquid manure. They are excellent in the cow stable, in the pens where the ewes are turned to yean, and for bedding brood sows with young pigs they are better in every way than straw. No young pigs are strangled in leaves as they often are in straw, and leaves harbor no vermin. Besides, they contain much more fertilizing matter than straw, being rich in potash and phosphoric acid. For these reasons the work of gathering leaves should be made one of the indispensable duties of the present season. Woodlands that are used for pasture should by all means be cleared, lest the heavy covering of leaves should smother the grass. Neither these nor other woodlands lose anything by this annual clearing off of leaves. The surface of woodlands is not exhausted by a growth of trees. The roots penetrate deeply and bring food from far below the surface soil. There need be no fear of injuring such lands by removing the leaves every year. Besides, in most cases the leaves do not stay beneath the trees, but are blown hither and thither, and finally rest in fence corners and lanes where they do no good. The small

TEMPORARY DAM FOR ARTIFICIAL ICE-POND.

steamer in which the feed is cooked. It is well to have two steamers, so that one can be long, jointed and tongued and grooved upon their edges. These are fastened to the posts by

under-growth of woods should first be cut off close to the ground and piled in heaps for removal. They may be cut up if no larger than an inch in thickness, by a strong fodder-cutter, or a broad axe upon a block, into lengths of two or three inches, and used for fuel. Then the leaves may be raked up with a horse hay-rake into windrows, and then into heaps. They may be loaded up into hay-racks covered with barn sheets or blankets, with barley forks or by means of leaf-baskets such as is shown in the accompanying illustration. We have purchased these made of splints for 50 cents each; but have seen them made and used by charcoal burners for this purpose, of a stout hoop of hickory to which a piece of coarse bagging is sewn. This makes as good a basket for gathering leaves as any. It should hold about two bushels when heaped up. A wagon is soon loaded by their aid. When gathered they should be stored in a place where they may be kept dry, and if in good condition, a ton of mixed hard-wood forest leaves may be considered as well worth two tons of straw.

The Ecraseur.

Some time ago we referred to an instrument used in the operation of emasculation, by which it was rendered much easier of performance and perfectly safe. This very necessary operation on the farm is not done without a certain amount of risk and loss of stock, and an instrument by which it can be performed safely, is of great value to those interested. Since our reference to the écraseur, we have received numerous enquiries as to the mode of using it. This we now describe. The instrument, as shown in the illustration, consists of a tube in which a chain of plate links is drawn in or out by means of a screw at one end. The parts to be removed are laid open in the usual manner, taking care to make an opening at the lower part of the scrotum, so that in case of the formation of pus in the wound, it may escape, and

not become absorbed. The chain is placed around the gland, and the screw is turned until the pressure of the chain upon the cords and vessels causes its separation. The operation is then complete. The compression to which the vessels have been subjected, nearly always prevents all bleeding, and but a few drops of blood are lost in any case. The pain is reduced to a minimum, and the after operation of cauterizing is unnecessary. The time occupied is very much shortened, and generally the process of healing commences at once and goes on successfully. By means of the length and peculiar form of the instrument, it can be used when other means would fail. We believe that Prof. McClure, veterinary surgeon, of Philadelphia, is to be credited with the introduction of this instrument into our practice, and that Mr. D. W. Kolbe, of Philadelphia, is the manufacturer of them. A cheap instrument is made especially for the use of those who cannot procure the services of a regular veterinary practitioner.

ECRASEUR.

A Farm Signal.

The following will be found a convenient method of conveying signals to distant parts of the farm, in place of the old-fashioned tin horn, the usefulness of which is confined to its one single unmelodious note suggestive only of dinner time. There are times when messages or instructions are to be conveyed, and it is not convenient to send a messenger. A visitor calls, or some business needs attention, and some one has to lose time to go to the farther end of the farm to convey the information. All these steps may be saved and the time also, by having a little code of well-understood signals, and a contrivance such as is here illustrated fixed to the gable end of the barn or the house. A short post is fastened to the end of the barn, passing through the roof. At the top of this post a wooden wheel is fixed, having two holes bored in the edge at opposite sides, and an arm projecting outwards from the edge. The wheel works upon a wooden pin driven into the post. A cord is fastened to each of the holes, and by pulling one or the other of these cords the arm is made to take any position desired. It may be held upright, or sideways, and level, upon either side, or pointing upwards or downwards upon either side. In this way seven different signals may be made. If more are needed there may be another wheel placed on the other side of the post, and seven more signals may be given. In this case each set of arms should be painted different colors. Red is the color that is most easily seen at a distance, and black would make a good contrast. In our own experience we have found that signals given in some such way are very quickly noticed, and when it is known that they are thus given the eye is very frequently cast in the direction to look out for them. A little red flag run up at dinner time or other times on the flag staff at the end of the house, never failed to

FARM SIGNAL.

bring us home within a few minutes, but in this case the signal failed to convey more than one message, and its meaning consequently was sometimes mistaken.

Method of Climbing Trees.

People who live in timbered districts frequently find it convenient to have some way of readily climbing a tree. In felling trees where timber is valuable, much damage and waste is prevented by being able to bring the

tree down exactly where it is wanted. To do this it is often necessary to climb the tree to be felled, and sometimes an adjoining one. In making surveys in wooded districts, or to get a more extended view in places that are only partly wooded, as in prairies made up of what

Fig. 1.—CLIMBING TREES WITH STIRRUPS.

are known as openings, where one has occasionally to hunt stray cattle, it is sometimes very necessary to get up a tree. This may be done very readily by procuring a pair of spiked stirrups like that in figure 2. It is made of a flat iron bar about an inch wide and a quarter of an inch thick, bent to pass under the boot in front of the heel, and made with loops by which it may be strapped to the leg. A sharp stout spur is fixed at the lower part, and when the stirrup is worn this spur comes at the inside of the foot. When a person wishes to climb a tree, one of the spikes is thrust into the bark and then the other, a step upward being taken at each time. A cord is carried around the waist, and if it is necessary to do any work while up the tree, the climber can pass the cord around his body and the tree, and make himself secure. The rope also answers to draw up tools or anything else that may be wanted. The method of climbing, by aid of these stirrups, is shown in figure 1.

Fig. 2.

CEILED STABLES.—The usual method of ventilating stables beneath barns, is by allowing the foul air to escape through the hay and grain stored above the animals. This is objectionable for obvious reasons. Such stables with poles or rails for the floor above, are dingy, dark, and generally well festooned with cobwebs. Besides their disagreeable appearance, they allow the dust, chaff, and hay seed, to fall upon the backs of the cattle, and these are thus always kept unclean. Dark stables and coats matted with dust are not healthful for cattle, to say nothing of the deteriorated condition of the feed stored above them, which is exposed to all the foul air that rises from beneath. We greatly prefer to have the floor

above laid with matched boards, which will prevent any dust falling through, and to have the beams and under side of the floor white-washed. Ventilation may be provided by spouts through which hay or straw could be thrown down below, and which should terminate in grated openings beneath the eaves.

Aids at Slaughtering Time.

The slaughtering of hogs is one of the most disagreeable labors of this season. It is made much more unpleasant than need be by the complete absence of any organized methods of going to work. Generally it is postponed to the latest moment, notwithstanding the fact that the earliest pork in the market rarely fails to bring the highest price of the season, and also that the colder the weather is, the less rapidly a hog fattens. As a rule, this business ought to be over before the winter has commenced, so that the pork may be made as cheaply as possible, and the slaughtering may not be more disagreeable than necessary. When a hog is to be killed, the first job is to catch him. This is very easily done by the use of an implement shaped somewhat like a shepherd's crook, shown at figure 1. The handle of this should be about five feet long. The animal is caught by any part of one of the hind legs, and the noose in the looped rope shown at fig. 2, is slipped over the

Fig. 1.—CROOK.

Fig. 2. NOOSE.

hook of the other one. He is then led to the slaughtering place or slaughter house, where by means of a hoist, the hook of which is placed in the loop of the rope, the animal is raised in a moment to a height that brings him into a convenient position for the butcher. The blood may then be caught in a barrel or other vessel, and made use of in the manure heap instead of being wasted upon the ground as is usual. The animal is then lowered into the scalding-tub shown at fig. 3, which should be kept close by, and when ready is hoisted out and lowered on to the seraping-table. This, which is shown at figure 4, is made of bars of wood fixed in a frame so that all the water and hair drops through into a heap, from which they may be easily removed. A scraper which we have found very useful is shown at figure 5. It is made of a piece of seythic bent into the shape here shown, and fastened by means of tangs made at each end into a wooden handle. With this the hair is removed with great ease and rapidity. The animal is then hoisted once

more over a wheelbarrow, or a square tub set upon legs as shown at fig. 6, into which the offal is received. The offal is thus kept clean, and the lard may be removed without being soiled. The whole arrangement is very simple, and one that may be modified to suit any circumstances.

more over a wheelbarrow, or a square tub set upon legs as shown at fig. 6, into which the offal is received. The offal is thus kept clean, and the lard may be removed without being soiled. The whole arrangement is very simple, and one that may be modified to suit any circumstances.

How to Make a Halter.

A very serviceable halter is here shown. It may be made for a few cents, and in a few minutes, out of a piece of leather, a buckle, and a few copper rivets. It may also be made of rawhide that has been well worked in oil and rendered pliable and soft. The safest way of fastening an animal is by means of a halter. To fasten a horse or a cow by a rope around the neck is to invite an accident by which the animal may be injured or even lost. Calves, colts, cows, and horses, should all be secured with halters, to which is attached a rope weighted at one end, passing through a ring bolt securely fastened in the stall. It is almost impossible for an animal fastened in this manner to get thrown, and if such a thing should occur it will not get choked as when fastened by a rope around the neck. To make the halter, it is only necessary to measure the animal with a tape-line to get the proper length of the separate pieces, and to cut the strips at least 1½ inch wide, and 2 inches wide for horses, oxen, or cows. If the halter is needed extra strong, it may be made double, and the strips held together by a few copper rivets and burs. For the cost of a few dollars every animal upon the farm may be supplied with a secure halter. The pattern of this halter is sufficiently given in the illustration without further description. The rings there shown may be omitted, and the strap under the jaws may be made to directly connect the nose-band and the throat-strap.

HALTER.

The pattern of this halter is sufficiently given in the illustration without further description. The rings there shown may be omitted, and the strap under the jaws may be made to directly connect the nose-band and the throat-strap.

Sheep Raising in Virginia.

Lying west of the valley of the Potomac, there is a broad belt of poor land stretching nearly to Gordonsville on the west, and almost to Richmond on the south. This region is crossed by the Orange and Alexandria Railroad, and the Chesapeake and Ohio. For eighty miles southwest of Alexandria, the country is desolate, the depots are few, the villages small, the farm houses very scattering and poor, much of the land is without fences, and growing up to brush and forest trees. There is hardly a good piece of corn in sight of the railroad from the valley of the Potomac to the Rapidan. The principal timber in this region is oak, poplar, or whitewood, paw-paw, and pine—of small growth. The district has never been thickly peopled, as the census returns show. There has been no increase in population since 1800, and a very steady decline since 1830—some of the counties having lost from one-third to one-half of their population. Land in forest can be bought for five or six dollars an acre, and old fields with buildings for about the same price, or a small advance. In a recent trip from Washington to Richmond, we passed across this district by way of Gordonsville. We learned from an intelli-

gent farmer who lives upon its outskirts, that the region produces cattle, swine, and sheep, but is generally a poor country, quite unprofitable for ordinary farm crops. He was a Virginian, working a 400-acre farm, and making it pay reasonably well. He had a well digested plan for raising sheep which is applicable to this whole region, and, if anything can be done to redeem this waste from its present desolation, it is sheep husbandry that will do it. There is no doubt that good farms can be made in this region by large expenditures for manure and labor, but the problem to be solved is to make the products sold pay for the improvement of the land, and the capital used in the improvement. The great objection to raising sheep in Virginia is the destruction of flocks by dogs. He would remedy this objection by keeping a shepherd to give his constant attention to the flocks, and fold them at night. Nearly all the damage caused by dogs is done at night, and if the flocks were folded securely then, there would be no loss. Sheep in fair condition can be bought in this region for about a dollar and a half a head. He would buy 200 ewes in good breeding condition, for say \$300, and four Cotswold rams for say \$100, making an outlay of \$400 for his flock. He would put the rams with the flock Sept. 1st to bring early lambs. Sheep do well in these pastures until late in December. As soon as snow begins to fly he would feed with hay, straw, turnips, and as the sheep approached yearning time, would add meal or grain. He would have a piece of winter rye ready for them to feed upon early in the Spring. By the time the rye was gone, the pastures would be green, and the sheep would take care of themselves. Sheep thrive very well in the climate of Virginia, and the excess of births from twins, he calculated, would make the lambs equal the number of ewes kept, if there should be occasional losses. There is a ready sale in the Washington and Baltimore markets for all the fat sheep and lambs that can be raised. He would send his lambs to market in May and June, and get for them by the wholesale an average of \$3.00, say 200 lambs, \$600. The ewes he would sell in July and August as fat sheep at \$3.50 each, say \$700. He would get at least \$1.00 worth of wool from each sheep, making \$200 for wool. The receipts from the flock for one year would be \$1,500. He would then buy another flock of 200 ewes and begin the year again September 1st. He calculated the sheep would benefit the pastures enough to pay for their keeping. The small plots where they were hurdled at night would be made very rich, and bear large crops of turnips, rye or hay. The principal expense would be the wages of the shepherd, and not more than half his time would be required in the care of the flock. From what we have seen of the influence of sheep in pastures, we have no doubt of their great value in improving the soil, and of their special adaptation to these old fields in this district. There are large tracts of lands, like these, in all the older States, that can be made valuable by sheep husbandry. The country needs more wool, lamb, and mutton.

The Pekin Ducks as Layers.

The sensation made last fall among the fanciers at the poultry exhibitions, by the extraordinary size of these new ducks, is likely to be equaled this season by their remarkable record as layers. Two of the imported birds

last year laid respectively 125 and 131 eggs. They have done much better the present season. One of the old birds commenced laying on the 27th of February, and laid 178 eggs in 182 days, missing but four days. The other did nearly as well. This is three or four times as many eggs as we ordinarily get from Rouens or Aylesburys. What is more remarkable, one of the young ducks, hatched in April, began to lay in August, and had laid seven eggs by the 1st of September. Such early laying is all that we expect of the best varieties of gallinaceous fowls. The Pekins as much excel in fecundity all other varieties of ducks with which we are acquainted, as they do in size. They have had the advantage of thorough breeding for centuries for their flesh and eggs, and we predict for them in this country the front rank among our useful aquatic fowls.

A Rat-Proof Fence.

Granaries, corn cribs, or poultry houses, may be made rat-proof, by means of a wire fence which we here illustrate, and for which we are indebted to the *Journal d'Agriculture Pratique*, of Paris. This fence has been introduced with perfect success, into the Garden of Acclimatation in Paris, for the purpose of preventing the depredations of rats. No rat can surmount this fence. It is made of thin wire bars placed an inch apart, and affixed to heavier cross bars; the ends of the bars being curved outwards, as shown in figure 1. When the building to be protected is placed upon the ground, and it is desired to prevent rats from undermining it, two rows of bricks or tiles are placed beneath the fence, one in an upright position, and sunk a few inches beneath the surface, and the other horizontally and projecting outwards, forming a bench. When the rats dig down to burrow beneath the building, they follow the first tile until they meet the second. Being stopped here, they burrow along the angle formed by the two tiles until they are tired, without being able to penetrate beneath the

Fig. 1.—END OF FENCE.

Fig. 2.—FENCE COMPLETE.

building. If they attempt to climb the wires, they get into the gallery formed by the upper curve, but can go no further. The fence of course is made of such a height that a rat can not leap over it. In the Garden of Acclimatation, the fence is about two feet in height, and is found perfectly effective. Figure 2 shows a piece of the fence complete. This contrivance

is also used to entrap rats, which it does in large numbers. A small park or enclosure is surrounded with this fence, protected at the bottom with tiles as already explained. An opening is made, by which the rats may enter but can not return. Seeing a possible escape by means of the fence they enter readily, but once within they discover that some men know more than a rat. There are many modifications of this simple contrivance, which will doubtless occur to our readers, by which farm buildings, grain stacks, and other places which suffer greatly from rats, may be made secure from their depredations.

PREPARING POULTRY FOR MARKET IN FRANCE.—In the vicinity of large towns in France, millions of fat chickens or capons are sent to market every year, an enormous supply going constantly to England. When the fowls are put up for fattening, they are fed almost entirely on crushed millet, or barley, (or a mixture of the two,) kneaded into a tough dough, to which a little butter or lard is added. Their drink is usually pure milk slightly sweetened with sugar; sour milk with sugar is frequently substituted. By means of this nourishing diet the fowls acquire a delicate, white, and savory meat, and become fat in an incredibly short time—often in ten days. Fat poultry is never sent alive to market. Capons, chickens, and pigeons, are bled at the throat, hanging head down until all the blood has escaped. Geese and ducks are killed by a stab in the nape of the neck. The feathers are picked off with great care to avoid injury to the skin, and after the fowls have been washed clean, they are well rubbed with wheat bran, which whitens them; the butchering is done at night, and they are hung up with a few raw truffles in each body; in the morning these are removed, having given a delicate flavor to the flesh.

Native Breeds of Sheep.

The United States possess every facility and requisite for the production of a great variety of sheep. Instead of importing wool of any kind, with our splendid facilities for producing both cheap and costly wool, we ought to export more than any other country. There are some coarse wools cheaply produced that may be made more profitable with us than the fine wools, yet we are trying to raise foreign breeds of sheep that deteriorate rapidly under the process of acclimation, and qualities of wool that are not in demand. Many a farmer has found the few fleeces of Cotswold or Leicester wool that he has had on hand almost unsaleable, because no country mill had the machinery for carding long wool. At the same time our markets are flooded with the poorest kinds of mutton, oily, greasy, and fat, or ill-flavored and lean, because farmers have been tempted to raise sheep for which their pastures are totally unsuitable. Before there can be any success in this business, it must be entered upon and carried on with judgment. No farmer who has not the best facilities both for feeding and marketing sheep and disposing of the wool, should try to raise pure Cotswold, Leicester or Lincoln sheep, especially the latter two. Indeed, these sheep do not seem to be profitable under any circumstances, except in the hands of the most skillful shepherds. The

Cotswold grades, or Cotswold-Merino crosses, furnish the best early lambs and the best mutton for the markets of large towns and cities. But early lambs cannot be shipped long distances, and farmers situated more than 200 miles from a good market cannot raise these lambs for that purpose. Where lambs and mutton are produced, wool becomes a secondary consideration, but where long wool can be sold readily the larger bodied sheep which yield a fleece of 8 or 9 pounds of wool will be the most profitable under certain conditions. And this is the most important consideration. To raise these sheep successfully, the pastures must be dry, healthful, fertile, and carry a good bite, and the soil and its culture must be such as to produce heavy crops of roots and green forage. It would be all the more satisfactory if the climate were such that late feeding upon rape, turnips, or other roots, upon the ground, and early feeding upon rye, clover, and other green crops could be practiced. This would enable the farmer to make a great saving, and yield a proportionately larger profit than the yard feeding through half the year upon crops harvested and stored at great cost. For instance, in the greater part of Virginia, parts of Tennessee, Kentucky, Maryland, and some other localities, similarly situated with regard to climate, the hurdling of sheep upon green or root crops might be practiced to a large extent, and the cost of their feeding reduced to a minimum. Under these circumstances the Cotswolds might readily be made the basis for a very profitable class of sheep, different varieties of which might occupy different localities as became the most suitable. But it will surely result, that there will be failure and loss, if in all localities, however diverse they may be in soil, climate, and other important conditions, the endeavor is made to keep up and produce any one particular type of sheep. In other places in the East and North, where hurdling cannot be practiced, the extra price to be procured for early lambs and choice mutton in the great city markets, will make the house or yard feeding of sheep upon crops grown on richly manured land equally profitable. But there are many localities still where it is difficult to keep sheep that require abundant pasture and roots for winter feed, but where mutton may yet be raised with profit.

In many parts of Europe sheep are raised upon mountains that are aptly styled barren wastes, and salt marshes and sandy plains, where one of our native sheep, much used to hardship as it may be, could not exist. Yet the mutton of some of these sheep is sold at stores where fancy fruits and choice articles of food are kept, as an expensive luxury. The small Welsh sheep, whose hind quarter of the most delicate mutton may weigh four to six pounds, is fed upon rocky pastures as bleak as the sides of the granite mountains of New Hampshire; while an equally choice mutton, to the epicure, is raised in the salt marshes of the coast upon sedges and rushes. The chalky downs of Southern England, where the soil is too thin upon the chalk rocks ever to be plowed, produce the South Downs and the Hampshire Downs, whose mutton is very highly prized, and whose fleece, although short is thick, and valuable for manufacturing.

The vast prairies of the West furnish exactly the conditions needed for these races of sheep; a short nutritious herbage, a perfectly dry soil, extensive open areas, and the most salubrious atmosphere, ever fresh and invigor-

PORTRAITS OF HORSES OF VARIOUS BREEDS. — Drawn and Engraved for the American Agriculturist

ating, and dry for the greater part of the year. These races of sheep also seem fitted by nature for those Western pastures. Their hardy constitutions, and their close compact fleeces, impenetrable by storms either of snow, rain, or wind, render them able to withstand with perfect ease those sudden but short periods of more than usual severity which sometimes occur. There are also the black-faced Scotch sheep, which would be perfectly at home upon the most northerly of the Western prairies. Western Kansas and Nebraska possess millions of acres which can be purchased for a nominal price that should never be disturbed by the plow, but should be populated by thousands of flocks of sheep who would there find a convenient and congenial home. From thence the wool and mutton could readily be transported to profitable markets. Further West still the range can be occupied by sheep whose wool alone should be the object of the shepherd. In each of these localities in course of time there could be built up a race of sheep eminently suited to its peculiarities, but the founding of such races will be the work of time, and to a great extent, a labor of love with some persons who must be devoted to this employment, and who, although "there's money in it" from the

first, will yet look for their most abundant reward to the general improvement of this important branch of American agriculture.

Various Breeds of Horses.

There is no domestic animal which has become more thoroughly adapted to the various needs of mankind than the horse; at the same time there is none of which a greater variety is more demanded to suit our various necessities. The road-horse and the farm-horse must necessarily be as distinct from each other as the work required of each is different. In the above illustration the different varieties in use with us, together with their several peculiarities, are shown at a glance. At first we have the thoroughbred, the source from which our road-horses derive their speed, courage, and endurance. In this breed great speed has been acquired by many years of care in breeding by selections from the Arab race, (shown on the opposite corner of the engraving), and by a long course of training. From the thoroughbred we have derived the pacer and the trotter. It may be thought that these animals have their chief use on the trotting track, and are therefore of

little account for practical purposes. There could be no greater mistake. The trotter has rightfully a large place in the agricultural interest of the country, for there is an immense and increasing demand for these horses for driving purposes at very profitable prices. The breeding of such horses, however, demands large capital and much skill, and is a business that requires undivided attention. The two choicest breeds of farm horses are seen at the lower corners. The Clydesdale and the Percheron breeds promise to give us a valuable class of heavy, powerful, and most useful animals, which are indispensable to the proper cultivation of the soil. The Percheron is rapidly rising in favor, and if care is used in procuring pure-bred animals, the breed will undoubtedly be a most valuable acquisition. The semi-wild races too, the Mustang of the Plains and the miniature Shetland, of the Scotch islands, deserve notice. The first is the hardiest and most useful animal that the Western herder can choose for his severe service, while the latter occupies a place as a pet for children, which no other variety of the horse can fill. The heads grouped in the center well express the intelligence and the gentleness of this, our most valuable and willing servant.

The Rose-Mallows—Hibiscus.

In another article we have mentioned some of the Abutilons; another ornamented genus of the Mallow Family, is *Hibiscus*, of which a hardy shrubby species (*H. Syriacus*) is well

6 or 8 inches across. Our plants produced flowers scarcely more than half that size, which is probably in part due to the severe drouth, and in part to the fact that the plant does not bloom until late, and the cool nights check its development. By the time it is well in flower,

upwards, or it may be pruned to a clean trunk, with a tree-like head at any desirable height. This tree form is very effective when planted out on the lawn in summer, and it is well adapted for the window, as its head can be quite above the lower growing plants. Another

SCARLET ROSE-MALLOW.

ABUTILON—BOULE DE NIEGE.

known as the Rose of Sharon, and a tender shrubby one is the Rose of China, (*H. Rosa-Sinensis*) of the greenhouses. Most of the species are herbaceous, known as Rose-Mallows, and a number of showy ones are natives of this country. Late in summer the brackish marshes along our rivers, are gay with the large pink hollyhock-shaped flowers of the Swamp Rose-Mallow, (*H. Moscheutos*) a species which does well in gardens, and is worthy of a place there. Farther South and West, there are several other species, all showy and desirable in large gardens; one of these (*H. grandiflorus*) has rose-colored flowers with a deep red center, which are sometimes a foot across. The most brilliant of all is the Scarlet Rose-Mallow, (*H. coccineus*), a strictly Southern species, which is found in marshes from the Carolinās, southward and westward. We had long known this plant from herbarium specimens, and were glad to receive this spring some roots from Dr. Lungren of Florida, which enabled us to see it growing. In its native localities this forms stems 4 to 8 feet high, but ours only reached about the lesser height, it is very smooth throughout, and has large long-petioled leaves, which are parted quite to the base in five divisions; the flowers, which are abundantly produced from the axils of the upper leaves, are bright scarlet, and when growing wild are

it will no doubt be cut down by the frost, but it is such a showy plant that it is worth growing, even if it can be enjoyed for but a short time. We doubt if the roots will endure the winter, but shall try some and take the others to the cellar.

Abutilons—Boule de Nieve.

Among the many ornamental plants afforded by the Mallow Family, the Abutilons take a high rank. One of these, *Abutilon striatum*, has been a long while in cultivation, and is now quite common under the rather absurd name of "Flowering Maple," no doubt so called from the resemblance of the leaves in shape to those of the maples. This is one of those plants that satisfy the most exacting grower, as it will bloom all the year round; it is easily managed as a window plant, and when set out in the garden in summer, it proves attractive there. The principal objection to it as a window plant, is its tendency to grow out of bounds, and as many cultivators are too fond of their plants to use the knife to them, we often see this grown out of all proper shape. No plant more needs judicious pruning, and none repays it better than this; it is so very tractable that it may be made to assume any desired form, and may be grown as a pyramid, well furnished with branches from the base

reason for its popularity is the ease with which it is propagated, cuttings of the half hardened stems taking root readily. The fine clean handsomely shaped leaves of this Abutilon, together with its gracefully pendulous, bell-shaped, curiously veined flowers, make it a very desirable plant. A variety with the leaves handsomely blotched with golden yellow, is one of the few variegated plants that are satisfactory at all times. This, which is called *Abutilon Thompsoni*, is equally manageable with the plain form, and whether grown in-doors with partial shade, or out in full sun, its markings are clear and brilliant; this form does not flower so freely as the plain. Another species, *A. venosum*, has larger and darker flowers than *A. striatum*, but is not so well calculated for window culture. Between these two there are several hybrids with florist's names. These plants are very useful in greenhouses and conservatories, for training up to pillars or against walls, they bear pruning so readily, that they may be made to adapt themselves to either place. Last spring we received from Mr. John Sanl, of Washington, D. C., a quite new Abutilon, under the name of *Boule de Nieve*, or "snow-ball," which, as its name would imply, originated in France, and the shape of its leaves, as shown in the engraving, indicate that it is from a species quite unlike those just referred to. The flowers are pure white, and of good

form; the little plant sent us grew rapidly, and flowered very freely, and should it retain these qualities when taken in-doors, it will prove a very valuable winter bloomer. White flowers of the size of these are in great demand by the bouquet makers, and this abutilon will no doubt be found profitable to those who grow cut-flowers for sale. It blooms when quite small; plants from cuttings flowered with us when only a few inches high.

Heating Greenhouses by a Flue—A probably New Method.

BY PETER HENDERSON.

While in Philadelphia a few weeks ago, I called on William K. Harris, Darby Road, West Philadelphia, having been informed that he had a system of heating his greenhouses by flues somewhat different from that in common use. I found his method not only entirely new to me, but also one that I think is destined to be of great benefit to those who do not wish to go to the expense of heating by hot water, as Mr. Harris' plan is certainly the next best thing to it. He showed me one building 100 feet long by 20 feet wide, which he assured me was amply heated by one fire only, allowing him to keep up a temperature of 50° over all parts of the house in the coldest weather. The furnace is built at the middle of the house, as shown in the accompanying sketch. The bars for the grate are 40 inches long, and enough of them to make a width of grate of 18 inches. The sides of the furnace are built of fire brick to a height of some 15 or 18 inches, over which is thrown an arch in the usual way. From the neck of this furnace or "fire box," proceed two flues, one turning to the right, the other to the left; these are built of brick so as to form a flue of 8 or 9 inches square on the inside. The brick part of the flues only runs 25 feet each way from the furnace, and from that point they are formed of 8-inch cement drain-pipe. Where cement pipe cannot be obtained vitrified, other kinds would do nearly as well. The brick part of the flue, as well as that formed by the pipe, is raised from the ground, on brick or flagging, so that it is kept free from damp, and that the radiation of the heat may be obtained from all sides. As will be seen by the sketch, the flues are so built as to be under the centre or middle bench; each flue forms a length of

the long length of flue could get around, and hence our experience in long horizontal flues of a "bad draft." By this ingenious plan the draft is made perfect, and a thorough radiation of heat from the flue in all its length is secured.

Mr. John Dick, (a neighbor of Mr. Harris), who probably has the largest area of greenhouses on the Continent, and which are mainly heated by double flues as in Mr. Harris' case, says that he never before saw or heard of this plan of starting the chimney on the furnace, so it would appear that Mr. Harris has the honor of the invention. Mr. Dick attaches great importance to it, and probably no man in the country has had better opportunities of knowing or better able to judge than he. The cost of a flue so constructed would probably not exceed \$200, while for the same glass structure, if heated by hot water, the apparatus would cost not less than \$1,000. This system of double flue would be equally applicable to a greenhouse of half the length, the only difference being that a furnace bar of 24 or 30 inches would be enough, and the area inside of the brick flue and pipes need not be more than 6 inches. It is necessary to take great care that both flues start from the furnace and be continued exactly at the same level, otherwise the higher one would draw the heat away from the other.

Notes from the Pines.

When I sent you twenty odd varieties of grapes, that you might see what could be done on my light, sandy soil, what did you do? Instead of eating them "judgmatically" and comparing one with another, you set the whole lot in the window with, as I learn, a placard, "Grapes from the Pines!" Of course all the passers on Broadway looked at the grapes, and the tens out of the hundreds and thousands who saw them, were sufficiently interested to ask questions. As a consequence of this publicity, I am asked among other questions: "What is the best grape?"—"What grapes shall I plant?"—"Where can I get vines of?"—this, that, or the other kind. The best way to satisfy these questions is in print, and if my "Notes" are this time

ALL ABOUT GRAPES, you have only yourselves to blame for putting my products in so conspicuous a place. To begin at the other end, and answer the last question first, as to

WHERE TO BUY VINES.—It is safe to say that every grape worth growing, and that will succeed, east of the Mississippi, can be had of any regular nurseryman. The advertising pages of your paper give the cards of numerous dealers, and

for any grape that people in general need to plant, these nurserymen can supply them. All the varieties I exhibited are in all first class nurseries; I have more than twice as many varieties as I sent, some not in bearing; some have borne, but if I have my way they never will again, at least not in my vineyard. Some grapes cannot have their merits tested in one or two years, while others are so undeniably bad that their fate can be decided at once. The question

"WHAT GRAPES SHALL I PLANT?" is an easy and a difficult one to answer. If one wishes grapes and a plenty of them, without being very particular as to quality, and if he thinks he has done his whole duty when he has

set his vines and given them something to run upon, let him by all means get the Concord. I of course do not refer to the far Southern States, but east, and west, and north of Georgia, this is thus far the universal grape. Although of Eastern origin, the farther west it is grown, anywhere this side of the Rocky Mountains, the better it is. In New England it is eatable, in Ohio it is good, and in Missouri it is so much better as to appear unlike the same grape. When we leave the Concord, telling people what grapes to plant is a risky matter. I see such a difference in localities close to one another, and such a difference one year with another in the behavior of the same varieties, on my own grounds, that I should hesitate to make out a list of six kinds for my next neighbor. My little vineyard is essentially an experimental one for my own instruction. The soil, so far as I can see, is alike all over the piece, and no fertilizer has been used save one or two light dressings of bone. I have one Salem vine that gives a good crop of good fruit; 25 feet from it is a Salem, two years older, that has never borne a berry. Last year, and year before, the Croton was splendid, this year not worth picking; this year the Ionas are very fair, the only crop in three years, and so it goes. Many varieties behave in such an unreasonable manner, that the experience of one year is no indication as to what they will do next. But one thing I do know: you may go to my Concord vines any year with a wheelbarrow, while to most of the other sorts a hand-basket will suffice. My own experience makes me hesitate when asked what grapes to plant. To the question

WHAT IS THE BEST GRAPE, I can only answer the inquirer: "The best is the one which will grow on your place and give you fruit." If the question refers only to quality of fruit without regard to the difficulty or uncertainty of producing it, my choice would not suit the majority. I like a high vinous flavor in a grape, while most persons look for sweetness. To my taste the choice would be between the Alvey and Senasqua, while 19 in 20 would prefer the over-sweet and cloying Delaware to either. Perhaps I can make my experience of some use to inquirers, by giving my opinion of the leading varieties as they behave on my place. When I procured the vines four and five years ago, I selected those kinds which were for the most part but little known, although none are rare at the present time.

Alvey.—Quality exquisite, but bunches usually poor.

Agawam (Rogers' 15).—Hardly worth growing.

Black Hawk.—Great earliness was claimed for this seedling of the Concord. With me it is not early, and not good for anything when it does come—worthless.

Barry (Rogers' 43).—This is earlier than the Concord, larger berry, good bunch, and a much better grape. This has so many good qualities, the vine being as healthy and hardy as can be, that I am surprised no more is said about it. It would bring a much better price in the market than the Concord, and for home use it is greatly preferable.

Canada.—Neither this nor the others of Mr. Arnold's varieties have done well with me.

Creveling.—This excellent early grape has not failed to give a good crop. The small and irregular bunches, which unfit it for market, are not objectionable for home use.

Croton.—It is already been stated that this

DIAGRAM OF GREENHOUSE—COURSE OF FLUES.

about 100 feet in this distance; the "rise" should be about 1 foot in 100—that is, the point where the flue starts from the neck of the furnace should be one foot lower than where it enters the chimney. The novelty of this manner of constructing a flue consists in building the chimney directly upon the top of the furnace where the two flues, after running for a length of a hundred or more feet each, (as shown in the sketch), enter it, and this method of placing the chimney on the furnace is the key to the whole improvement—the continued heat given out by the furnace is sufficient to drive back the cold or outer air that would necessarily force its way down the chimney before the heated air running through

quite failed this year after two seasons of most satisfactory performance.

Delaware.—I am surprised that this should do so well upon my light soil. It is one of the varieties that will bear feeding, and when the vine gets age it bears abundantly. It is the favorite with most persons, on account of its intense sweetness.

Essex (Rogers' 21).—An exceedingly rampant coarse vine, with large brownish berries in loose bunches; quality inferior. With me not worth the room it occupies.

Eumelan.—I set out some 15 or 20 vines of this when it first came out. Perhaps one half of these are scarcely larger than they were at the end of the first season; some of the others have done fairly, while five or six are magnificent vines bearing all that a vine ought to bear; and this happens with vines which were apparently alike when planted, and with those that are side by side in the same row. Mr. Meisner, of the great grape growing establishment of Isidor Bush, Son & Meisner, Bushburg, Mo., was here a few days ago, and in discussing varieties, I asked about the Eumelan in Mo. He gave it high praise in every respect, except in the one just mentioned—the uncertainty attending the growth of the vines. My laggards will come out this fall, and I will see if there is anything the matter at the roots. As to the fruit itself, I do not think too much can be said in its praise. The bunches are well shouldered, with a fine bloom, and as to quality, but few American grapes can equal it. When these and Black Hamburgs are upon the table at the same time, I taste of the Hamburgs and eat the Eumelan. If it were not for the uncertainty above mentioned, I should advise every one to plant the Eumelan. It mildews, and so do almost all good grapes, but I do not fail of a crop.

Hine.—A little known variety, which as to its fruit, might be readily mistaken for the Delaware. The bunch is looser, the berry a trifle larger, and to my taste a better flavor.

Iona.—Too uncertain to commend, but fruit of the first class when you get it.

Ives.—This is absolutely worthless with me. Vines out five years, and not a berry but has cracked, mildewed, rotted, or done something unpleasant. Yet, westward it is certain beyond all others.

Lindley, (Rogers' 9).—Very sweet and fair quality, but fruit drops badly.

Martha.—This bears well enough, but that persons who have ever tasted a good grape, can eat this, is quite beyond my comprehension.

Salem.—Rather uncertain. Large and sweet. Does worse with me than on better soil.

Senasqua.—Late in ripening, but of the highest quality to those who appreciate life and brilliancy in a grape.

Walter.—Does nothing with me, vine four years old, and not a decent bunch yet.

Wilder, (Rogers' 4).—What I have said of Barry, will apply to this; it is a week or more later than the Barry, and a larger bunch. This year some of the berries have dropped, but as they did not do so in former years, I attribute it to the long drouth. This is a wonderfully showy and attractive grape, of better quality than the Concord, and every way to be commended for beauty, productiveness, and vigor. If I were intending to raise grapes for market, I should make a trial of this and Barry,

Dreer's Improved Lima Beans.

Lima beans are a rather troublesome vegetable to prepare for the table, on account of the difficulty of shelling them; their pods do not open so readily as those of other varieties, and the operation requires strength of thumb nails as well as patience. In the ordinary Lima there is a great waste of pod; the beans are set wide apart, and the pod is often so constricted that the halves touch between the beans. A large pod will frequently have but two, or at most, three beans, but this can be improved by selecting for seed, only those pods which have four (or more if possible) beans in them. The Lima is a distinct species (*Phaseolus lunatus*) from the common bush and pole beans, (*P. vulgaris*), and shows very little disposition to depart from its natural condition, or as the gardeners phrase is, it will not "break" readily into varieties. Some years ago one of our Western friends made many experiments, with a view to producing a low growing or bush Lima, but when we last heard, he had not succeeded in overcoming the disposition to go to the top of a tall pole. A few years ago Mr. Henry A. Dreer showed us some Limas which he considered a great improvement upon the ordinary kind, and this year we received from his son a basketful of the same beans for trial. We learned that this variety is the result of a careful selection carried on for some 20 years. In these beans the pods are not only full, with no spaces between, but are as full as they can stick, the seeds so crowding one another, that the ends of the central beans are square; the bean is also much thicker than the ordinary; the two engravings of both kinds given on the next page, do not exaggerate the difference in this respect. A vine of this kind bearing the same number of pods as one of the ordinary kind, would, we should judge, yield nearly if not twice as much in shelled beans. It is stated that this variety is much more productive than the ordinary, yielding many more pods to the pole. The pod being so completely filled, the shelling becomes an easy matter, and the beans when cooked are much superior to the ordinary ones, as the amount of skins is much smaller in proportion to the enclosed nutriment. We regard the improving of this bean as one of the most important of the recent contributions to horticulture. We take quite as much, if not more, interest in a new variety, or the improvement of an old variety, of garden vegetables, as we do in those among fruits and flowers. And he who makes three Lima beans grow where there were only two before, is entitled to quite as much credit as one who produces a coleus with a new stripe in its leaf, or a strawberry a trifle larger than any other, and horticultural societies should offer equally large premiums for improvements in the one class, as in the others.

BUYING AND PLANTING BULBS.—Whatever other spring flowers we may have, bulbs are essential, and the garden would hardly seem complete without its array of Hyacinths, Narcissuses, and all the rest of the bulbs, which unite beauty, brilliancy and fragrance, as do no other plants. October is the best month for planting bulbs, as they then have time to form roots before cold weather sets in; still we have had very satisfactory results from planting in November, and have known them to be put in as late as January, by taking advantage of an open spell.—We would much rather take the

risk of late planting than be without their flowers in spring, and those who have neglected or omitted to provide a stock of bulbs can yet do so, even at this late day. There are some who give special attention to these plants, and they are always on the lookout for novelties; such persons need no advice from us. But to the majority, especially those of moderate means, a hyacinth is just as welcome without a name as with, provided it be of good form and pleasing color. Unless one cares for the named varieties, much more satisfaction may be had for the same money by leaving the selection to the dealer, merely indicating the colors desired, and their proportion. We have had very good results from the assorted bulbs which are sold at much lower rates than the named ones. By sending to a dealer for his catalogue, the price can be readily ascertained. Another advantage in getting catalogues is, that they give all necessary directions for cultivation, and besides being a price-list, the catalogue of the present day is a clever little handbook of culture. We do not know how a few dollars can be more satisfactorily invested for the garden than in bulbs.

HYDRANGEA PANICULATA GRANDIFLORA.

The Horticulturist a few months ago made the announcement that this is a meritorious shrub, and apparently thinks it has made a new discovery. In its edition it says: "It is now about six years since its first introduction into this country, and yet only within two years has it been brought forward with much notice; nor do we remember ever seeing it illustrated in the 'high art' pictorial agricultural journals." We do not know if the Horticulturist classifies the *Agriculturist* among the "high art" pictorial agricultural journals" or not, but this Journal "illustrated" this Hydrangea in April, 1868, from a living specimen. We admit that the art of "Pictorial Agricultural Journals" is not quite so "high" as that of the Horticulturist, as we never knew one of them to publish an illustration of the Crystal Palace at Sydenham, and try to make people think it was a view of Kew Gardens.

GREAT YIELD OF RHUBARB OR PIE PLANT.

—A truck farmer near Providence, R. I., sold in that market the last spring and summer nine tons of Myatt's Linnæus Rhubarb from a quarter of an acre of land. Owing to very sharp competition he only received twenty-five dollars a ton for it, or one cent and a quarter a pound. This is \$225 worth of truck from a quarter of an acre, or \$900 per acre. If it had not been for competition, and the rhubarb had been sold at former season's prices, he would have received at the rate of \$1,800 an acre for this crop. This is by no means an unparalleled return for such farming. It is a result of a very liberal use of manure and labor, and of adapting crops to the wants of the market. A farmer uses fifty dollars' worth of manure and thinks he is very extravagant. A market gardener uses two hundred dollars' worth on rich land, and regrets that he had not put on more.

How to Grow Cauliflower.

BY PETER HENDERSON.

There is perhaps no vegetable we cultivate that is so uncertain of giving satisfactory results as cauliflower, particularly if grown for an early crop. It is often rather amusing to see how the failure to obtain a crop astonishes our

full fledged scientific European gardener, on his first attempt here. When he starts in the spring with his plants, all the conditions are apparently the same, as they were when he planted near London or Paris, but as the sea-

CORAL ROOTS—CORALLORHIZAS.

son, advances the conditions change; and he has a drier atmosphere and a higher temperature, making a climate entirely unsuited to the crop, and the result in five cases out of six is partial or entire failure. But there is one way to obviate this failure. If the ground has been properly prepared by heavy manuring, and if good plants are on hand, they should be planted the first week in April—certainly not later than the second week. By the middle of May they will have made a fine growth, but by this time the high temperature begins, accompanied by a dry atmosphere; to obviate the effects of these, and to produce the crop in perfection, copious watering is essential. One of my neighbors in Jersey City had a patch of about half an acre, which he annually, for many years, planted in cauliflower, and never failed to have a heavy crop, but his land was so situated that he could thoroughly irrigate at pleasure, which insured his success. When a few dozen plants are grown for private use, and where water is convenient, each plant should have, if the weather is dry, at least three gallons each evening for about two weeks before the time of heading up. A mere sprinkling is utterly useless; enough must be given to reach the lowest roots. When the ground is thus saturated, the temperature is also lowered and the atmosphere surrounding the plants made also more humid—conditions indispensable for the well being of the cauliflower crop.

The Coral Roots.

There are some native plants so strikingly odd in their appearance, so unlike the general run of plants, as to attract the attention of those who do not generally take much notice of wild-flowers. Among the singular looking things that those who ramble in the woods are likely to come across, are the Coral Roots; they are generally a puzzle to those who have no knowledge of botany, on account of their lack of green leaves and the peculiar lurid look of the stems and flowers; hence it happens that specimens are frequently sent to us for a name. The coral roots belong to the genus *corallorhiza*, which is from Greek words for coral and roots, both names having reference to the peculiar much-branched roots which bear some resemblance in form to a sprig of coral. These roots are believed to be parasitical upon the roots of other plants, and as they thus steal their nutriment, the Coral Roots have no need of foliage; the only approach to leaves is some small sheaths at the lower part of the stem, which, like the rest of the plant, are brownish or yellowish. They belong to the orchis family, which is noted for the peculiar structure of its flowers, and as it would not be easy to describe the flowers of these plants without enlarged drawings, we content ourselves with an engraving which shows their general aspect. The flower, when carefully examined, is not without beauty, the lip, or large lower petal, which is usually

white, being often handsomely marked with crimson dots. There are four species in the Northern States, two of which are shown in the engraving; the smaller one is *Corallorhiza odontorhiza*, the tooth-rooted, and the other *C. multiflora*, the many-flowered Coral Root; they are found in woods from July to September, the first named being somewhat the earlier. We regret that the specimens came to us without

LIMAS—UPPER, OLD; LOWER, DREER'S IMPROVED.

the peculiar roots from which the plants derive their name, and we would request those who send us specimens for name, to always send the root if the plants are small, and in the case

of large plants to examine the root sufficiently to inform us of its character, whether fibrous, tuberous, etc. The herb doctors consider the coral root, at least the smaller of these two, as possessing medicinal properties, and use it as a

LINDLEY'S BUDDLEYA.

stimulent diaphoretic, and it is in their nomenclature called also *Crawley* and *Dragon's-claw*.

Lindley's Buddleya.

Last summer we grew *Buddleya Lindleyana* for the first time. It is a sort of half shrub, growing about three feet high, with leaves and flowers of the shape and size shown in the engraving. It blooms abundantly, bearing flowers at the end of each branch of a fine violet purple color. This species was brought by Fortune from China, and named by him in honor of Dr. Lindley, while the generic name commemorates an English botanist named Buddle. There are some eighty species, most of which are found in South America and other warm countries. This species is quite hardy in the Southern States, but having but one plant we did not care to test its hardiness.

PRESERVING FLOWERS.—WINTER BOUQUETS.—This series of articles is interrupted this month, as the writer has had so much visiting of fairs to do, that he has been unable to make the necessary experiments. In this, as in all similar matters, we like to speak from experience. All flowers to be dyed, and all the grasses to be crystallized, colored, or otherwise treated are first dried, and when a stock of them is secured, they can be made up at leisure.

THE HOUSEHOLD.

(For other Household Items, see "Basket" pages).

A Useful Piece of Furniture.

In many rural households, the space allotted to the kitchen is often cramped and narrowed too much. Women are not often consulted when houses are built, and it is usually the kitchen that suffers for lack of room. A piece of kitchen fur-

Fig. 1.—AS A SETTEE.

niture, therefore, that will answer three distinct purposes, is a great convenience. Here is one (figure 1) that is at once a settee, a trunk, and an ironing table or bake board. There is a box or trunk, in which one may stow away many things that usually lie about, having no special place allotted for them otherwise. The lid of this trunk

Fig. 2.—AS A TABLE.

forms the seat of the settee. The ends are raised up, forming the arms. The back of it is pivoted upon one side of the ends, and when it is turned down, as seen in figure 2, it forms a table. When it is turned down, it is held in its place by two small hooks, seen in the illustration at figure 1.

Household Carpentry.

The short days and long cool evenings, remind us of the approach of Christmas, and already many are thinking of Christmas presents, and preparing for them. In the majority of cases the most appropriate present is one of little intrinsic value, so far as the materials are concerned, but upon which pleasant labor has been expended, so that the present becomes truly valuable to the recipient, for the reason that it is the handiwork of the giver, who has wrought many kind and loving thoughts into the gift. In the case of Christmas presents, the point of all others to be decided, is, "what shall I give?"—This being determined, all the rest becomes comparatively easy. Among the articles that are frequently purchased for presents, are little parlor or chamber ornaments, such as brackets, match-boxes, clock-racks, and other little tasteful and useful articles made from wood. Those offered for sale are made upon the large scale by machinery, but very beautiful things of this kind can be made by hand, if one has a fair amount of skill and a good share of patience. The materials and the tools cost but little; of course the finer the wood, the handsomer will be the work, but black walnut makes up sufficiently handsome, and can be had almost anywhere; for small articles the wood of cigar boxes answers well, especially if care be taken to select the finer

kinds, and pine and other light colored woods may be stained, if no other material is at hand. The wood should not be over one-fourth of an inch thick, and for small work it may be only half that thickness. A saw is required which has very fine teeth, with an exceedingly narrow blade to allow of ready working in curved lines, and it must be mounted in a manner adapted to the work.

A very neat saw is now sold for this kind of work, and is shown in figure 1. The saw can be readily put in and taken out of the frame, by turning the small thumb-screws at the ends of the arms. The work may be done on a ordinary table, or a bench may be provided, consisting of a smooth board $\frac{1}{4}$ of an inch thick, 12 inches long, and 8 wide, in one end of this a piece is cut out like a letter V, and the board screwed to a table, so that this cut end projects about two inches. Having determined what to make, the next thing is to fix upon the design, which may be made as elaborate as one chooses; sets of designs of various articles made of full size to serve as patterns, are furnished with the saw above figured, but any one with a little ingenuity, can make a design to suit the fancy.

Take the back of the match box, figure 2, as an illustration; this has its two lengthwise halves exactly alike, hence only half the pattern need be drawn. The half pattern being set off on a piece of stiff paper, the paper is then doubled and the pattern cut out, using a sharp pen-knife with a smooth board to cut upon.

Upon unfolding the pattern, both sides will be exactly alike. In drawing, use a ruler for all straight lines, as any inaccuracy will be more readily noticed in this part of the work than in any other. The pattern is then laid upon the wood, and its lines traced with a pencil. All the openwork parts of the design, from which the wood is to be cut out, will need to

be made with a large awl, to admit the saw. The manner of holding the work upon a table is shown in figure 3, a different style of saw is shown there, but the difference is only in

Fig. 1.—THE SAW.

Fig. 2.—MATCH-BOX.

Fig. 3.—MANNER OF HOLDING THE WORK.

have one or more holes made with a large awl, to admit the saw. The manner of holding the work upon a table is shown in figure 3, a different style of saw is shown there, but the difference is only in

the frame. If the little notched bench referred to is used, then the part to be cut should come directly over the V-shaped notch. The saw must be inserted in the frame so that the teeth point towards the handle, as the cutting is done with the downward stroke only. The outside lines of the pattern being cut, then the upper end of the saw is removed, by unscrewing the clamp, and inserted in one of the awl holes, and each portion of the interior portions of the pattern cut away one after another. As with any other mechanical work, a certain amount of practice is required before this can be done readily; it will be found that when the saw is working in the direction of the grain, it is more difficult to guide than when cutting across it; if the saw gets fast, as it sometimes will, do not use force to remove it, as it is very thin and may be broken; care and patience will overcome the difficulties, and the manner of handling the work will come with experience. Rough edges may be smoothed by the use of sand-paper and a file; when a piece has several parts, it is put together with brads, first boring holes with an awl. The best finish for articles of walnut, is to rub them over with linseed oil. We shall have something more to say on this kind of work at another time. By reference to the premium list, it will be seen that the Publishers have included this saw among their premium articles, or it may be obtained from them for \$1.25, post paid.

BY FAITH ROCHESTER.

CRYING BABIES.

A young mother and a neighbor just called in a moment to ask me, "Did you ever give Soothing Syrup to any of your children?"—"Never"!—"I didn't know but I had better get some for my baby, I can't bear to hear him cry so."—It is certainly very hard for the mother to bear, and it must be hard for the baby, but soothing syrup wouldn't help either of them in the end. The baby is only three weeks old, and during the last week, since the mother dismissed her hired girl, and began to take the care of her little family, the baby has cried a great deal, generally resting pretty well at night, however. The parents have rocked it and walked with it, and the little thing wants to be tended in some way almost constantly. I asked if there seemed to be any danger of a rupture from its crying. Since no danger appears, I could only advise the mother to keep as still and quiet as she can herself, eating plain nourishing food and resting as much as possible, and try time and patience instead of soothing syrup. The *Agriculturist* quoted a statement from the California Medical Gazette, a few years ago, that this popular syrup contains nearly a grain of morphine to an ounce of the syrup, so that the dose for a child three months old, is equal to ten drops of laudanum. In San Francisco, where about 100,000 bottles of soothing syrup were sold annually, it was also the case that one-third of all the babies there died under the age of two years. Soothing syrup indeed!

A neighbor recommends to this young mother some kind of patent pills, which had a wonderfully quieting influence upon his babies years ago; but none of us know what these sugar pills contain. Others would recommend, some one thing, and some another, all with a view of quieting the baby.

The child needs a healthy mother more than anything else, and its mother wrongs it by her well-meant efforts to do more work than her present state of health will warrant. Calves and colts are not so treated, and they have no need of drops and syrups. If baby cries, it is probably uncomfortable in some way, though I suspect it has already learned to want "tending." I can hear my neighbor's little one, and it seldom sounds to me like a cry of positive pain. If my own babies only cried like that, it seems to me that I could bear it more easily when they get into a crying spell. I wonder if it can possibly be because this one is not *my* child, and so does not pull upon *my* heart strings? No, I hardly think that explains the difference, for I

was glad to find that my care of my neighbor's new baby, while its mother was unable to dress it, called out the same tender, motherly, and worshipful feeling toward the innocent new-comer, that I had felt for each of my own babes.

WHAT IS THE MATTER?

I have noticed a great difference in the crying of children. Some babies, and some older children, when they cannot have what they want, or when they feel unwell, keep up such a moderate kind of "boo-hoo-hoo" that no one is much affected thereby. Other babes cry with all of their might, going so nearly frantic if their pain of body or mind is not allayed, that all in the vicinity are nearly driven frantic also. This difference depends much upon temperament, but sometimes it seems to be the result, in considerable measure, of different methods of baby-culture. But, oh dear! how can we know just the right way each time? A baby is such a complex thing! It has in it the blood of so many ancestors, all of which may modify its mental and physical constitution in ways we little dream of—for I have little faith in the rather common latter-day doctrine, that parents are wholly responsible for the peculiar organizations of their children.

"What is the matter with that child, that it cries so?"—"Firstly, is it a sticking pin?"—"No."—"Has it been hurt in any way?"—"No."—"Is it colic?"—"If so, it draws up its legs and inclines to double itself together while crying, and perhaps its feet are cold at the same time. Warmth, by external application of warm cloths over the bowels, or simply a warm hand underneath, as the little one lies face downward, is the simplest and best cure for colic, and a gentle patting upon the back at the same time may help on the cure. *Don't* try the various teas so generally recommended. If you begin on one, you will probably have to follow it up with another. Not a drop of any kind of "herb tea" have any of my babies taken.

But what is the matter with the screaming baby? Ear-ache perhaps, as several times with mine after hot windy weather lately. Get a piece of cotton-wool—pull it out of a bed-quilt or comfortable if you have no other—and wet it with sweet oil or glycerine, and stuff it into each ear of the sufferer to soften the wax, the hardening of which, from undue exposure to cold or wind causes the ache. If the baby is teething, and its gums are troublesome, it may be best to call the doctor, but look carefully to its diet, and keep its nerves as quiet as possible. If you can not find the source of its trouble, and it still cries, wet a clean napkin or soft towel in cool (not cold) water, and lay that gently over its head and forehead, and possibly it will stop crying at once, and drop asleep in a few minutes. I have tried this more than once, with success. After all, perhaps the baby was only hungry, and having asked in vain, by all the pretty ways of asking that it knows, it has cried out in despair or rage, or earnest entreaty, while it has been tossed, and trotted, and chirruped to, and sung to, and dosed, perhaps, all for nothing. You thought it was not time for it to be hungry, but its last meal may have been spoiled in some way, so that it got little, or was obliged to throw it up almost as soon as swallowed. But do not offer it the breast until you are sure that something else is not its trouble. It may be suffering from too much food already.

It is *not* a very simple and easy thing to bring up a modern baby in the midst of modern civilization. Nevertheless, it is the most interesting work and study that I know of at present.

POISON IN GREEN WALL PAPERS.

The *Agriculturist* has already warned its readers of the danger lurking in the bright green of paper-hangings, but the matter should not be lost sight of. Medical authorities state that this is quite a common cause of illness, especially among children. Arsenic is generally used in the green coloring, and so poisonous is it, that many persons, both young and old, have been made positively and dangerously sick by living or sleeping in rooms where the wall-paper was green, or largely of this color. Others have suffered in less degree from this poison, and a decided change for the better,

following a removal from rooms so papered, or a removal of the suspected paper from the walls.

Never give bits of green paper or green cloth to small children who will be likely to suck or chew them, or serious poisoning may be the result. While on this subject, let us speak also of the visiting and other cards with enameled surface, made shining by the use of poison white lead, very dangerous in the hands of young children.

WARM UNDER-CLOTHING.

Whether it shall be made of flannel or not, who shall say? Some strongly advise flannel next the skin for all seasons of the year, others advise it only for winter, and others think flannel too irritating to be worn immediately next the skin of the whole body at any time. Having decided this matter for ourselves, according to our own best light upon the subject, the most important thing is to pursue an even course, not wearing a flannel undershirt one week, and a cotton one the next, with no special reference to the time of year and its probable changes. The skin gets accustomed to either cotton or wool, so different in their texture and feeling, and changes from one to the other require considerable judgment. Careless changes from woolen under-garments to cotton ones may cause diseases of the lungs or of the digestive organs.

It is certainly reasonable that warmer clothing should be worn in winter than in summer, and it will be time, when the *Agriculturist* for November is at hand, for mothers to be putting winter garments on the children. The little boys should all have warm under-drawers of woolen or of cotton-flannel. These may be cut by the long trousers pattern, but without any seam at the sides, and with more fullness around the body, as the two legs need not be sewed together, except a part of the way in front. Such drawers should button to a warm-sleeved under-waist, or be attached to the same when made. They should be gored at the ankle, both on the inside seam and on the fold opposite, so that they may fit well under the stockings. Left open at the bottom a few inches, they lap over more smoothly. Some mothers cut under-garments of their small children like night drawers, or with waist and drawers in one piece. If short trousers are worn, warm under-drawers, reaching to the ankle, should surely form a part of the same costume, and leggins or high-top boots should be added in cold weather. A fundamental principle is, "*keep the extremities warm.*" Many children, perhaps the majority of the little folks, are stunted in their growth by insufficient clothing, especially upon the lower limbs during winter.

Consider the barbarism shown in the winter-clothing of little girls. Imagine yourself walking to school, with the thermometer in the neighborhood of zero, or lower, and nothing covering your flesh between your shoe-tops and the bottom of your dress skirt—a space of several inches perhaps—except one thickness of stocking. Woolen stockings perhaps—you may have thought your duty done when you substituted home-knit woolen stockings for sale ones of cotton. But just think how little protection that really is, and, as I said before, imagine *yourself*, or your husband, dressed in that style in cold weather. Your skirts, at least, afford you some warmth, but look at the little girl's skirts. They seldom protect even her knees from the blast, and when she sits down hurriedly upon a cold bench or chair, there is often but one thickness of cotton between her flesh and the freezing board. It is not uncommon to see little girls, under four years of age, sitting upon the cold floor, with their skirts spreading out in such a way as to leave only their drawers for protection from cold beneath them. Very little dependence should be placed upon skirts except for ornament, while drawers and trousers should be well looked after as actual protection from exposures of all kinds.

It will not answer to leave our little girls without long under-drawers, because they wear leggins, when out of doors. One thickness of stocking on the lower part of the leg is really not enough for in-door wear. Put yourself in the little girl's place, and how would you like it?

Don't tell me that little girls have dressed in that way these many winters, and it hasn't hurt them. All that talk about this and that thing not having done hurt, because one has managed to live in spite of it, does not convince me. Why is it that more than half of the children die under the age of five years? Why have we no healthy women?

The clothing should be evenly distributed over the body. The average school-girl under ten years of age, has perhaps four, possibly five, thicknesses of cloth upon her waist—supposing that she wears a high apron and a low-necked chemise and skirt waist. Probably she has not more than three thicknesses between her elbow and waist, the lined dress sleeve and the apron above. Between her waist and knees we will suppose four or five thicknesses, lower than that, above the shoe, only one thickness. Is it reasonable? Dare you risk it another winter while diseases of all sorts are abroad? They usually make their victims of such persons as have prepared *their bodies to take diseases*, by lowering the vitality in some way. Of course, then, all of us who have given thought to the subject, will straightway provide long warm under-drawers for all of our children. While we are about it, let us put them upon ourselves; for every woman needs them.

Something About Soups.

Our correspondent, "Rel," sent us some time ago an account of Prof. Blot's manner of making soup. The recent death of Prof. Blot gives them especial interest. He was earnestly engaged in the attempt to teach our people better and more economical use of food, than is generally practiced, and his loss is greatly to be regretted.

POT-AU-REU.—"Six pounds of fresh beef (ribs, knuckles, or loin) in a crockery kettle, with five quarts of cold water, salt, and a little pepper, on a slow fire. Take off the scum carefully when it rises. Add two white onions with one clove in each, a small parsnip, a carrot, two middling-sized turnips, half a head of celery, two leeks, two sprigs of parsley, one of thyme, a clove of garlic, a bay leaf, and a little caramel to color it. Simmer five or six hours. Dish the meat with the parsnips, turnips, and leeks around it, to be served warm after the soup or kept for the next day. Strain the broth, skim off the fat at the top, put back on a good fire, and at the first boiling pour on croûtons in the soup-dish and serve."

Thus endeth the Professor's recipe. Observe, firstly, that you must use a "crockery kettle"—that is some good soup-kettle. Many are the husbands who expect as good home-made soups as they get at first-class restaurants, and many are the discouraged wives who would gladly cook to please their husbands, but who neither of them dream that anything better than a common iron kettle is necessary in which to make nice soup. So, nine times in ten, the soup is more or less flavored with iron. Prof. Blot always says "a crockery kettle" or "a stew-pan" when he mentions the utensil for cooking any dish, meaning the glazed or enameled ware. Marian Harland tells us never to cook onions in an iron kettle.

Observe, secondly, that you are to "simmer" your soup "for five or six hours." To simmer is to boil gently, yet the boiling should not cease for a moment during those five or six hours.

Observe, thirdly, that you must skim off all of the fat. Many people imagine that the melted tallow gives richness to the soup, but all the best cooks agree in saying "take off all of the fat"—and so, I think, says every educated stomach.

CROÛTONS.—Cut slices of the soft part of bread, either round, square, oblong, or star-shaped, and about a quarter of an inch in thickness. Have hot butter in a frying-pan, on a sharp fire, place the slices of bread in it, turn over when fricid on one side, and take off when both sides are of a fine color; drain them as dry as possible, and they are ready for use. These are excellent in pea and bean soup, but as some may object to them, it is best to serve in a separate dish, to add to the soup in the plate.

BOYS & GIRLS' COLUMNS.

Horse Trees.

We must tell you about a horse-tree. No, not a horse-chestnut tree, but a tree, or rather trees, in shape like a horse!

ENGLISH HORSE TREE.

the Gardeners' Chronicle, of London. Perhaps you will remember some pictures you have seen, of old gardens of a hundred or more years ago, when it was fashionable to clip trees and shrubs into the shape of animals...

A Personification.—Hornets' Hop.

Some artists have a great fancy for personifying birds, quadrupeds, insects, and even inanimate things. By personifying, we mean giving the animals or things human expressions, and drawing them as if they were performing human actions.

HORNETS' HOP.

them, were beasts, birds, or insects, with the most comical countenances, engaged in doing the most ridiculous things. For instance, there would be a grasshopper mowing with a scythe, a frog with a barber's apron...

—Of course you never did, and so we publish the picture that you may see for yourselves how they do it. Hornets make people dance sometimes, as many a boy knows, and we do not see why they should not do a little dancing themselves. It is a funny idea of the artist to make these usually troublesome insects having a hop all by themselves.

THE BEETLE.

the hornets, they attacked the horse, and you may be sure that there was a very lively time for a few minutes. They have the credit of being very industrious insects, and of working all night when the moon shines.

Aunt Sue's Chats.

ALONZO D. G., thinks it "makes an evening pass pleasantly, to do tricks and experiments," and wants to know if I don't "know some." Yes, Alonzo, I "know" lots of them, and have kept a dozen people busy for an entire evening.

Then say to the company, "there you see five perfect squares, take away three matches only, and leave three perfect squares." And now is a good time to study characters, some will see it at a glance, others look a little while, don't see it, and lose interest in it;

having three perfect squares. I could tell you of several more, but must attend to some other of my correspondents now. You might cut that paper four inches square, (?) that was mentioned in the Agriculturist some months ago, and tell your friends to cut it in such a manner that they can walk through it.

Aunt Sue's Puzzle-Box.

NUMERICAL ENIGMAS.

- 1. I am composed of 12 letters: My 7, 1, 11, 4, is a girl's name. My 10, 2, 5, 6, 12, is capacious. My 3, 9, 8, 7, is a number. My whole is where the author of the enigma lives. HERBERT J. K.

- 2. I am composed of 17 letters: My 1, 6, 11, 4, is a pronoun. My 5, 15, 7, 17, is that which confirms. My 9, 16, 10, is a color. My 13, 2, 3, 12, is much used by sportsmen, My 8, 11, 14, is a Scripture name. My whole is a command, A SUBSCRIBER.

PUZZLES.

- 1. I am a musical instrument, and although I contain two large vessels, and three-fourths of another, am often put into my first. QUIZ. 2. Take a certain tree; break the last half of it, and it may benefit you, but if you reverse the first half, and break that, you will surely come to grief. F. R. S. 3. With five letters express a sentence containing nineteen letters.

DIAMOND PUZZLE.

- The center letters, perpendicular and horizontal, name an Indian princess. 1. An insect. 2. A place of rest. 3. A title. 4. A cake. 5. A labial. ELLEN M.

CROSS-WORD ENIGMA.

My first is in daughter but not in girl, My next is in crimping but not in curl, My third is in peach but not in pear, My fourth is in table but not in chair, My fifth is in feather but not in bird, My sixth is in letter but not in word, My seventh is in Annie but not in Nell, My eighth is in tumbled but not in fell, My whole has now left us: we loved him well. L. F. M. L.

EQUIVOCAL WORDS.

- 1. To instruct—to send to jail—to perform. 2. A sort of dictionary—an agreement. 3. An edible—a disease—to salt. 4. Part of an indictment—a title—to reckon. 5. A fish—a fruit—a mechanical contrivance. 6. A small sail-boat—a trade—cunning. BESSIE.

SQUARE WORDS.

- 1.—1. Stingy. 2. A girl's name. 3. An acid. 4. A title. P. INK AND CAP I. TAL. 2.—1. Fashion. 2. A precious stone. 3. Black. 4. Animals. "A YOUNG MAN."

TRANSPOSITIONS.

- (Fill the blanks with the same words transposed.) 1. The — ate up the —. 2. He went to — to — his wrongs. 3. The — which she wore, came from —. 4. Ask the — to — the volume. 5. The bush has — — always.

ARITHMETICAL PUZZLE.

- 1000 and tea. 100 and an a. 150 and go. 1 and h. 1001 and nan. 100 and ein. 55 and see.

My initials are things of great use to us, My finals go faster than the fastest "bus." NIP.

A targe singue lilw claydind wedgeonlack shi stefdec.

Marmots—Tame and Wild.

Did you ever see a Marmot? Very likely you will all say no, although you have seen one, but under a different name. At all events, you have read about the European marmot, which is found on the Alps, and other high mountains. It is about as large as a hare, with yellowish

MANNER OF CATCHING A WOODCHUCK.

gray fur, and lives in holes among the rocks, frolicking about all through the short summer, and sleeping through the long Alpine winter. Just think of going to bed when the snows first come, and sleeping on and on, until they have melted away before the spring sun. The picture below tells a part of the marmot's history. These people are interested in feeding a marmot, and they are dressed quite differently from our people. They are Swiss, and the picture tells us that the Swiss catch and tame the marmot. They are very fond of these animals as pets, as they are quite gentle and playful, and make pleasing companions. Sometimes the Swiss boys, who go to other parts of Europe to earn money as organ grinders, take a tame marmot with them, as the animal is a curiosity to those who do not live in the mountains. The American marmot can also be tamed.—“You didn't know that there were any marmots in this country.”—There are, and plenty of them, only we call them by different names, which, though more familiar, are not so pleasing as marmot. We know our animal as the woodchuck or groundhog. There is no reason why it should not be called a marmot, for it is own brother to the Alpine one; by own brother we mean that it has the same kind of feet, teeth, etc., and in all the important things by which naturalists classify animals, the two are closely alike; ours differs from the European in color, among other things, and has considerable black about it. Those of you who live upon farms, no doubt know this marmot very well under the name of woodchuck. How the fellows like to frolic in a field of clover on a bright moonlight night, and what havoc they make in the clover! They do not dislike a bit of tender cabbage from the garden, and take it altogether, we do not think the farmer would look any more favorably upon the animal if it were called marmot, than he now does. Did you ever see a tame woodchuck? We have, and a funny little chunk of a fellow it was; it had been petted so much, and fed so freely, that it waddled about in the most laughable manner. They do not forget their sleepy ways, even when tamed; when winter approaches, they roll themselves up into a ball, putting the head down against the belly, and away they go for a long sleep; they are of no trouble during the winter, as they have only to be stored away in a box with plenty of hay and cotton, and they

FEEDING THE TAME MARMOT.

will tuck themselves up in bed for a long nap. We must tell you how a young friend of ours, who is a great hand for catching animals, captured his woodchuck. The animal was in its hole, and as our friend had nothing on hand to dig with, he resorted to a clever trick. Having a piece of fish-line in his pocket, he made a slip-noose in one end of it, and tied the other end of the line to a stout stick; the noose was then opened, and passed into the hole; the woodchuck did not like this, but snapped at the string, at which the boy gave a jerk, and caught the animal by its very long front-teeth, then he had only to pull, and the captive was hauled out of its hole, much against its will. Our friend sent us a drawing of the affair, which we give here; it is not as cruel as it looks, and if one is to capture a woodchuck, no doubt this is as gentle a way as any, and the inconvenience at the time may be made up for by after-kindness to the captive. It has one advantage over other pets, as it can be kept asleep all winter.

Popping Corn.

Isn't it fun to pop corn?—and when it is popped isn't it good? Most boys in the country grow a few hills of pop-corn to furnish them amusement in the winter evenings. There is some skill to be used in so simple a thing as popping corn. In the first place, the corn should be well dried, for when too fresh and soft it does not pop well at all. Then a wire popper with a long handle is the best thing to pop it in. A very small handful of corn, only about enough to cover the bottom, is put in the popper and the cover fastened down. Then we must heat the corn gradually, holding it at a distance from the coals, and when it is well heated through bring it nearer to the fire, when the popping will begin. You must

shake all the time, and the more the corn pops the faster you must shake to prevent burning. If the corn is of a good kind a very little will fill the popper when finished. Pop! pop!—how the little grains bounce about as they jump up and put on their snowy night-caps. Look at a popped grain. It does not seem at all like a kernel of corn; it is fairly turned inside out. What makes the corn pop and behave in this way? The chemist says that the corn contains an oil, and that the heat turns this

oil into gas, and when the pressure of this gas gets strong enough to burst the grain, pop it goes. That corn contains oil, may be new to you, but there is oil in

No. 440.—A PUZZLE PICTURE.—LOOK SHARP!

it, and in some kinds of corn a great deal. Sixteen gallons of oil have been obtained from one hundred bushels of grain, and very nice oil too. It has but one fault, and that is it costs too much to get it out of the corn; while the mineral oil lasts—the petroleum from which they get kerosene—it is not likely that we shall feed our lamps with corn oil. When you hear the grains go off with a “pop,” and a “sput,” just remember it is the oil that affords you all the fun, and turns the hard and flinty grains into beautiful masses of corn-starch, not only pleasing to look at, but wholesome to eat.

About Secrets.

BY M. H. G.

Little Margy whispered in her Aunt Margy's ear: “Promise not to tell anybody, and I'll tell you a secret.”

“I'm afraid I can't promise,” said Aunt Margy. “It is not easy to keep a secret.”

“Why! I think it is,” said little Margy, “I have kept my secret two whole days.”

Aunt Margy laughed. “I am afraid your secret, like the secret of King Midas, will be whispered about sooner or later,” she said.

“What was his secret?” asked little Margy.

“Why, he had asses' ears, which he was careful to hide under his long-eared cap,” said Aunt Margy, “but the barber who shaved him, saw his long ears—”

“And then he ran and told all the folks,” interrupted little Margy.

“No,” went on Aunt Margy, “he didn't dare to tell anybody, for fear that his own ears might be cut off, but yet he could not keep the secret all to himself. So he dug a hole in the ground, and whispered down to the earth: ‘King Midas has asses' ears.’ Then he filled up the hole, but a reed sprung up on the spot, and whenever the wind blew, the reed whispered: ‘King Midas has asses' ears.’”

“What a funny story!” cried little Margy. “But it isn't true, is it?”

“No,” answered Aunt Margy, “but the old Grecian historian tells it. It teaches us how hard it is to keep secrets. But the best way is not to have any.”

“I think so too,” said little Margy, “so I tell you mine. I am going to make papa a present on his birthday. I have made him a butterfly pen-wiper, with red glass-eyes. Don't tell I told you, until I give it to papa to-morrow—please don't, I mean.”

“I won't tell,” said Aunt Margy. “I can keep a secret one day. I enjoy hearing such secrets as this.”

“But poor King Midas!” said little Margy, “to have to wear a cap, instead of a crown, to hide his asses' ears.”

“And the barber should not have whispered the secret even to the earth,” said Aunt Margy, “for it is not honorable to tell the secrets of others, especially if telling will make them unhappy.”

A Puzzle Picture.—The puzzle picture given above is, we think, one of the best we have ever published. In most of them, after the concealed portion is known, it is impossible to see anything else, but in this, the landscape remains just as perfect after the trick is found out as before, and in looking at it one can hardly see a trace of the other, if he tries ever so hard. Some of the puzzle pictures that we have published, have been copied in other countries, and we should not be surprised to meet this one in some European journal.

The Ethics of Life Insurance.

Fire and marine insurance are purely matters of finance; the rendition of an equivalent for losses incurred. No great moral principle, beyond the general morality of trade, is involved in their details. Important as they are, they cannot be said to be based upon any moral principle, or to tend to the elevation of the standard of morality. Their operation is founded only upon economy, and their details are matters of dollars and cents.

It is not so with life insurance. Here a great moral principle is involved. The transaction is not merely one relating to dollars and cents. Morality and religion have to do directly with it. Humanity is elevated, the world made better, and the individual disciplined by self-sacrifice. Considered in view of all this, life insurance rightfully takes its place among the noblest charities man has conceived in aid of his fellow-man.

Life insurance is a moral duty. Rich men are the exceptions. The great mass of mankind never rise above the possession of an ordinary income, and the greatest number live only from day to day. Life insurance is now so cheap that it lies within the possibilities even of the poor. Any man may take out a policy of life insurance and still supply his family with the comforts of life. But moral duty does not end here. He has been the shield of his family during life. It is his duty to see that after his death they are still provided for. After he has passed away, he must still be their shield, and they must still feel his unseen but fostering care guarding them from want and its attendant train of evils. By a judicious investment in life insurance he can effect this, and die, comforted by the thought that his wife and offspring will not be dependents upon the bounty of relatives, or worse than that, upon the cold charities of the world; either of which, to the refined and sensitive nature of woman, is almost as terrible as death. When we consider how few men in the fluctuations of life, are enabled to amass a competence, and preserve it so that it will be available for the future use of their families, the duty of life insurance is made plain. No man that is not utterly selfish can endure, for a moment, the suspicions that his family may be exposed to destitution; no man who is not a confirmed miser, will hesitate to remove every contingency of future want.

In getting life insurance, get the best; and this is to be had in every form, of the United States Life Insurance Co., of this city.

Safe Illuminating Oils.

So much has been written within the past four years, in reference to the dangerous character of the burning oils in common use, so many lives have been lost, and so much property destroyed by means of them, that it would appear almost superfluous to again warn the public of the danger of using anything but the best and highest test oils.

Thousands of families, however, continue to burn oils that are less safe than gunpowder.

The leading refiners have of late given their attention to manufacturing a safer and more reliable grade of oil for ordinary use, and as a result, the more volatile article is being in a measure displaced. Messrs. Chas. Pratt & Co., 108 Fulton st., New York, have been the pioneers in this good work, and as such are entitled to the thanks of the community. Their Astral Oil has now obtained a world-wide celebrity as the safest and best oil of the kind ever made—and it is to be hoped will in time entirely supersede the use of the common article.

And Not Wear Out.

For sale by Watchmakers. By mail, 50 cents. Circulars free. J. S. BIRCH, 37 Maiden Lane, New York.

MONEY MADE RAPIDLY with Stencil and Key Check Outfits, Catalogues and full particulars free. S. M. Spencer, 117 Hanover St., Boston, Mass

**Read This Once—Once!

WALTHAM WATCHES.**

A CORRECT Timekeeper is indispensable to every one who has appointments to keep, **MEN AT WORK**, trains to meet, meetings to attend, in fact any business that is worth doing should be **DONE WELL AND ON TIME.**

For this purpose every one should own a Waltham Watch, and to meet **THE MEANS OF ALL CLASSES**, they are made of various grades, so that every taste and purse can be suited. A **SUBSTANTIAL ACCURATE WATCH** in a Solid Silver Case can be bought for \$17, and an **EXCELLENT SMALL SIZE GOLD WATCH**, for Ladies, for \$30. From these prices they increase in value according to the finish of the movement and **WEIGHT AND PATTERN OF CASES.** Special qualities are made for Railroad use and Travellers. The **STEM-WINDING ATTACHMENT** is now to be had with watches of any size or grade, and in cases of any weight or pattern. To buy one try the following plan first: **WRITE A SHORT LETTER** (on a postal card will answer) as follows:

Howard & Co., 222 Fifth Avenue, New York:
Send me your new Price List of Waltham Watches as advertised in the Agriculturist.
(Sign name and address in full.)

By return mail you will receive the Price List free and post-paid. It is a book of 16 pages, and in it are described **ONE HUNDRED AND SIXTY-FOUR VARIETIES** of Waltham Watches, from which you cannot fail to make a selection. Send us the order according to the directions in the Price List, and **WE WILL SEND THE WATCH** by express, with the bill to collect on delivery. On every bill are instructions to the Express Agent to allow the purchaser to **OPEN THE PACKAGE AND EXAMINE** the watch before paying. If it is not in every way satisfactory you need not take it, but let it **COME BACK AT OUR EXPENSE**; even after you have taken and paid for it, if it does not prove satisfactory you can exchange it, or we will **REFUND THE MONEY** at any time within a year.

Do not let distance from New York deter you from writing, as the farther you are **THE MORE ADVANTAGE IT IS FOR YOU** to buy of us.

We have sold some Sixteen Thousand Waltham Watches on this plan during the last six years, and fully one-half went **WEST OF THE MISSISSIPPI** and to the Pacific States and Territories. At all events if you feel the least interest in the matter, write for the Price List, **IT WILL ONLY COST YOU ONE CENT** for a postal card.

Be sure and mention that advertisement was seen in the *Agriculturist*.

Consumers' Importing Tea Co.,
No. 8 Church Street,
P. O. Box 5,509. New York City.

This is a combination of capitalists to supply the consumers of Teas throughout the United States on the mutual principle.

We have experienced agents in all the best districts of China and Japan to select Teas especially for our trade.

We expect every consumer of Teas to render us all the assistance they can in carrying out our enterprise, as we make a specialty of **SUPPLYING CONSUMERS ONLY** (and allow no middlemen to make any profit on our importations), which will enable us to supply them with Teas at prices lower than have ever been known, and of those fine qualities that seldom reach the interior, being sold only in the large cities and among the very wealthy.

Hoping the consumer will take an interest in our enterprise, and send at once for a circular with full explanations of how to proceed to obtain our goods, we remain,
Most respectfully yours,

Consumers' Importing Tea Co.,
No. 8 Church Street,

THE PEOPLE'S Force Pumps.

Awarded medal of American Institute over all competitors last fall. For the house and out of doors. Non-freezing, and adaptable to wells from 6 to 100 feet deep. Highly recommended for city houses on account of their great power. Parties about to supply themselves are invited to call and examine. Circulars sent on application. Plumbers are particularly requested to call. See *Ogden Farm Papers*, Dec., 1871. See "Notes from the Pines," on page 181, May number, of *American Agriculturist*, 1874.

Certain parties, with the intent to profit by the well earned reputation of these pumps, the result of faithful manufacture, having imitated them, the Public are cautioned to look for the name, "People's Pump," Patented Aug. 31, 1869, east on the lid, to insure obtaining the genuine article, and to avoid litigation.
W. S. BLUNT, 77 Beekman Street, New York.

AUTOMATIC PUMPS.

ARTHUR'S

ILLUSTRATED HOME MAGAZINE.

Bright, Cheerful, Progressive, always up to the advancing thought of the times, the HOME MAGAZINE takes rank with the leading and most influential periodicals of the day.

1875

It is on the side of Temperance and true Christian morality. Whatever is hurtful to Society it condemns without fear or favor, and makes itself felt in the Homes of the People as a power for good.

THE GREAT HOUSEHOLD Magazine of America, is more thoroughly identified with the People in their Home and Social Life than any other periodical in the country.

"DEBORAH NORMAN: HER WORK AND HER REWARD." A new serial story By T. S. ARTHUR will be commenced in January.

"FIFTY YEARS AGO; OR, THE CABINS OF THE WEST." By ROSSELLA RICE. These papers will be fresh and new, and of unusual interest.

"THE STORY TELLER." This department will be unusually rich. Besides an abundance of Short Stories, two or three serials will be given during the year.

BUTTERICK'S NEWEST PATTERNS for ladies' dresses and childrens' dresses are given by special arrangement every month.

"THE LION IN LOVE," and **"THE INTERRUPTED READER,"** two large and splendid premium engravings. One of these is sent free to every subscriber.

\$2.50 a year is the price of "ARTHUR'S ILLUSTRATED HOME MAGAZINE." In clubs; 3 copies for \$6; 6 and one extra to getter up of club \$12; 10 and one extra \$20. 15 cents must be added to each subscription for prepayment of postage for the year. Specimen numbers 15 cents, in currency or postage stamps.

T. S. ARTHUR & SON, Philadelphia, Pa.

PETERSON'S JOURNAL

OF POPULAR LITERATURE.

ALL ARTICLES COMPLETE IN EACH NUMBER.

Messrs. H. Peterson & Co., well known through the country from their connection for many years with the SATURDAY EVENING POST, will shortly begin the publication of a First-Class Monthly Magazine, to be entitled PETERSON'S JOURNAL, and to be devoted to the most popular literature of the day.

PETERSON'S JOURNAL, the first number of which will be issued for December, 1874, will be the cheapest FIRST-CLASS MAGAZINE published in America—and will aim to furnish a greater amount of superior reading matter, in a more elegant form, than can be procured elsewhere for the same price. It will avoid all continued stories, the publishers believing that the breaking off of the narrative each month interferes with the enjoyment of the reader. Each NUMBER WILL BE COMPLETE IN ITSELF—and will present regularly a variety of popular stories and miscellaneous papers, written by some of the most talented authors of this country and England.

In order to give time for the publication of the new Journal to become known to our host of old friends throughout the country, the first number—that for December—will be ready early in October.

Terms \$5.00 a year. An extra copy will be supplied gratis for every club of five subscribers at \$3.00 each. The postage will be prepaid by the publishers, without extra charge, in accordance with the new law. Specimen copies 25 cents. No specimens sent gratis. Address,

H. PETERSON & CO.,
920 Walnut St., Philadelphia.

BENJ. W. HITCHCOCK, Publisher, 355 Third Avenue, New York.

The Herald of Health

Sept., Oct., Nov., and Dec. numbers free to new subscribers for 1875, who send in their names immediately.

The September number, among other able articles, contains the following of great interest:

1. The Literature of Quackery.
2. Reform in Child Education.
3. Tent-Life in Summer.

This number will be given free ONLY to those who send in their names before Dec. 1st. The Oct. No. contains Dr. Clarke's remarkable article on

1. The Building of a Good Brain.

Also:

2. Mosaic Food Laws.

3. Headaches, How to Avoid Them.

4. The Physical Life of the Germans.

5. MALADIES CAUSED BY BOOTS AND SHOES.

Also, Crimping the Hair; Varicose Veins; Salt Rheum; Diet for Lean Folks; How to stop the Spread of Typhoid Fever; Gloomy Feelings; Insanity; Dandruff; Dyeing the Hair; Baldness; Bad Breath; Periodic Drunkenness; Funny Poems; Perils of Weakness; Girls' Rowing Match; Clean Water and Cow's Health; Care of the Eyes, etc., etc.

The Nov. No. contains a very remarkable paper by Herbert Spencer, on

The Cause and Cure of Evil.

And many other papers too numerous to name.

We give for \$2.00 premium:

No. 1. THE COMPLETE WORKS OF SHAKESPEARE,

in one large volume, with good type and paper, of over 1000 pages, and 36 illustrations. The most remarkable instance of cheapness we have any knowledge of.

No. 2. The Greatest Premium Yet.

For \$2.25 we send HERALD OF HEALTH and the great story

Robinson Crusoe.

Robinson Crusoe.

Robinson Crusoe.

In one beautiful volume, bound in cloth, gilt edges, and over 600 pages. Every child will be delighted with this offer.

CLUBBING RATES:

One copy, with both the above premiums, \$2.75; ten copies, with Shakespeares, 15.00; ten copies, with Robinson Crusoe, \$17.50; ten copies, with both the premiums, \$22.50.

HERALD OF HEALTH and Premiums No. 1 or No. 2, with any \$4 magazine, both post-paid, \$5.50; New York Tribune, post-paid, and Premium No. 1 or 2, \$3.75; Agriculturist, post-paid, and No. 1 or 2, \$3.00.

The HERALD OF HEALTH is the most substantial journal of its kind published, employing only the best writers. The Christian Standard says: "It is a great pet in our family, looked for with deep interest." The Christian World says: "It is the best magazine of the day," and the Scientific American says: "It contains more sensible articles than any magazine coming to our sanctum."

In case none of the above premiums are wanted, we will send either of the following, with the HERALD, for \$2.00:

How to Educate Yourself.

How to Make Money.

Both by GEO. CARY EGGLESTON,

Or,

How to Behave.

The latter is a perfect book of etiquette for the young.

These three books are handsomely bound in cloth. For \$3.00 we will send all the last named books and HERALD OF HEALTH. The books alone would cost \$2.25.

NOTICE.—In all cases send 10 cents additional for prepayment of postage on Herald for 1875. Samples 15 cents.

SOMETHING Worth Looking Into By Every One.

Please Examine Carefully and Thoughtfully the Contents of this and next Pages; see what is said, and what is offered; it is eminently worthy of your attention.

To Do Good AND at the same time Make Money

is certainly desirable. Mere money making is a low pursuit—especially when what you gain some one else must lose. But when *your* gain is also profitable to friends and neighbors with whom you deal, it is very pleasing. This

Is Just What is Proposed to You in these Pages.

Two men, equal in physical and mental power, with equal advantages, commence together in any pursuit—in trade, commerce, manufactures, mechanics, farming, gardening, fruit-growing, stock-raising, or anything else. One uses what knowledge he has, and toils on early and late; he is neither idle nor lazy, but he depends mainly upon *work* alone. The second man does all this, but, *in addition*, he keeps his *ears* and *eyes* open; he picks up every item of information he can gather from the experience and practice of others, learning quite as much perhaps from their failures as from their successes. He not only takes time to go and see what others do and *how* they do it, but he carefully studies every written or printed scrap, showing *what* others are doing, *how* they do it, *how* and *when* and *why* they succeed, and how and when and why they fail. This knowledge he utilizes in his own business, and he *prosper*s, because he constantly

Makes the Brains Help the Hands.

The brute animal uses his muscles only; the human animal reasons and studies *how* he can use his muscles, his toil, to the best advantage. By so much more as a man cultivates, develops and uses his *thinking* power, by so much more does he rise above not only the brutes, but

above his fellows who depend almost entirely upon their physical efforts—their hard work.

A Bit of History, and what came of it.

Nearly 40 years ago, a Young Man, brought up to hard work on a Western stumpy farm, had finished sowing three of four adjoining 10-acre wheat fields, all similar in soil, etc. While his team was resting at eventide, he pored over books and papers, and catching at an item, he took a lantern, went to the barn, made a solution of tar and water, wet the remaining wheat seed in it, and the next morning dried it off with slaked lime, and sowed it on the fourth field. The result was, an *excess* of over 5 bushels *per acre* of nice plump wheat on the last 10 acres, which sold at \$1.12½ per bushel. The tar cost about 25 cts. This single *hint*, gathered from *reading*, gave him at least

\$56.25...for 25 Cents.

This led him to figuring upon the *profit* of *studying* into the experiences of *other* people. He reasoned that if two millions of the farmers of our country should read enough to each get and turn to account only one such hint, in the course of a year, there would be an aggregate

Gain of \$113,000,000!

He saw at a glance that if every tiller of the soil, every mechanic, etc., would only be on the sharp lookout for information, and could directly or indirectly learn what others were doing, and *how* they were doing, it would *add greatly* to the *profit* of each one's labors. He further saw, that as few men have time or money to travel round, it would be of *great advantage* if some one would *gather up* a mass of *useful, practical* information, *print* it, and *scatter* it among all others of *like occupations*. But to do this *well*, the person doing it must himself be educated by *work*, by *practice*, by a good deal of *observation*, and by study and discipline of his own mind.—His ambition was stirred to do something in this direction, and he began studying night and day, as far as necessary farm work would allow; he disciplined his mind to *right* thinking and reasoning, by hard study of mathematics, languages, etc.; he went through the best Seminary, and then the best College course he could; he traveled many hundreds of miles on foot through different parts of the country, to see *how* different men practiced. He afterwards shut himself up in one of the best Laboratories in the country, to study out what aid could be got from chemistry and other sciences in regard to soils, manures, food of animals, etc., etc. He at the same time attended Medical and other lectures, to learn something of the use and *misuse* of medicines, etc. He had scarcely gone through this course of study, and learned enough to know that many of the pretended discoveries in agricultural science were unreliable, when he was earnestly invited to New York to help edit a Journal that had been struggling along for ten years. This was over twenty one years ago. Shortly after he invested his all in purchasing the Journal, so that he could manage it according to his own views of

what was needed. He laid out his plans, and has since followed them, as detailed below:

1st.—To popularize the Journal by adapting the reading to the wants of the *entire family*—in Country, Village and City.

2d.—To print nothing that could lead anybody astray, even if he had to leave out nine-tenths of the sensational items that so often filled newspaper columns, and even if he should sometimes be styled "old fogey," as was done.

3d.—To call to his aid the *best practical men and women*, and to get the *best sifted* information, at *any cost*, not only that the Journal should have powerful aid, and in great variety, but so that it would go on as a permanent institution, should he himself fail in health or life. In fact, the paper was organized to run independently of himself, if need be. At its helm was placed Dr. GEORGE THURBER, one of the most practical men of our country, *thoroughly informed in all departments*. As assistants were engaged such men as JOSEPH HARRIS, formerly editor of the *Genesee Farmer*, and the cultivator of a large farm in Western New-York, whose "Walks and Talks," detailing his own daily experiences, his successes and failures, have been everywhere useful; GEORGE E. WARING, JR., whose works and writings are widely known, and who cultivates a large farm in Rhode Island. With these are the quaint and practical TIMOTHY BUNKER, Esq., HENRY STEWART; PETER HENDERSON, the eminently successful gardener; Hon. FREDERICK MUEHLEN, of Missouri, and many others whose teachings, given from their *practical experience*, are held in the highest esteem by all who know them. The *House-keepers and Childrens' Department* have the aid of FAITH ROCHESTER, AUNT SUE, and others. All these, and *many others*, including hundreds of correspondents all over the country, have long given their *best thoughts* to this Journal, and *still do so*.

4th.—To edit the Advertising Columns as well as the reading matter, and shut out all advertisements of Patent Medicines, all secret things of uncertain value, all *unreliable* persons and dealers, etc., so that the *WHOLE PAPER*, even to its advertising columns, should be *entirely trustworthy*.

5th.—To investigate and expose the various *Humbugs* that prey upon the ignorance of country and city. This department has shown up 2,000 swindles, and saved the people millions of dollars.

6th.—To supply the Journal at the bare cost of printing paper and press-work, depending upon future good advertisements to pay other expenses, and supply any reasonable profit, etc.

7th.—To push the paper into the hands of the great mass who would be benefited by it.

☞ As experience, facilities, and means increased, the scope of this paper has been further enlarged to meet the wants of the entire country, especially as a *FAMILY JOURNAL*. The Engraver's art has been called in, and Illustrations which teach so much more and faster than mere printed words can do, have been largely introduced—not ink daubs, but finely cut, beautiful pictures, executed in the highest style of the art.

The Result.

The above Journal, still called by its original name, the "*American Agriculturist*"—though having now a *far wider range* than is implied in its mere name—has found a hearty welcome everywhere, not only in the Country, and Cities, and Villages of every part of the American Continent, but it circulates largely in Australia, and in the Islands of the Pacific, in distant Asia, along the coast and northern regions of Africa, away in Russia, and elsewhere throughout Europe. For seventeen years it has been is-

...sued in separate English and German Editions, each containing similar illustrations and reading matter, and supplied at the same price. It

Exactly Meets THE People's Wants.

It gathers, sifts, and condenses a vast amount of reliable information for the "Farm," the "Garden," and the "Household," both for Village and City people.

Its Suggestions have set tens of thousands of people on the road to profit.

It has saved the people at large from millions of dollars of loss by explaining the tricks and wiles of specious swindlers.

It gives every year at least 500 BEAUTIFUL and INSTRUCTIVE ENGRAVINGS, costing \$8,000 to \$12,000, and every reader has perfect copies.

More than \$25,000 are expended every year in collecting and preparing the best and most useful information, hints, and suggestions, supplied by the experience and observation of practical men and women. (Indeed, it is hardly possible for any one, anywhere, to read this Journal a year, without getting some hint, that will directly or indirectly put many dollars into his pocket, or at least save many dollars of loss.)—Thousands upon thousands of persons have written, telling how its teachings have put money in their pockets, many times its cost. (These letters would fill many large volumes.)

Tens of thousands of Mechanics, Traders, Professional men, Factory-workers, etc., are now enjoying their pleasant garden-plots and yards, cultivated solely from the directions of this Journal.

It is of universal utility, containing hints and suggestions useful in every part of the world.

To Housekeepers everywhere it is of great value for its practical talks about all departments of home labor and care.

To Children and Youth it affords pleasing Pictures and entertaining and instructive reading.

With all the above, it is the Cheapest Paper in the world, taking into account its size, its beauty, and the great expense and care devoted to its preparation. (Every volume contains more reading matter than 20 ordinary Books which are sold at \$1 each.)

The PRICE per annum is only \$1.50, of U. S. Currency; four to nine copies are sent for \$1.25 each; ten to nineteen copies, for \$1.20 each, and twenty or more copies, only \$1 each! (N.B.—As the Publishers will pay the postage after Jan. 1, 1875, 10 cents in addition to the above terms must be sent with each subscription, to prepay this postage.)

(The Publishers will pay the postage by the ton weight, so that expense will be saved the subscribers by the new arrangement, and the Publishers will be able to enlarge the paper from time to time, without doubling the postage to the readers, as has hitherto been the case.)

To our Old Readers the Publishers beg to say, that while the long-time Managing Editor,

and his full force of workers, will continue as heretofore, the Old Editor has returned from a year's furlough, re-invigorated in health, and has disconnected himself from all other literary journals and pursuits, and will hereafter devote himself to this Journal, and the Publishers believe you will find the American Agriculturist not only better than ever before, if possible, but better and better, as time goes on.

To New Readers let us say, that we believe you will find great profit in reading the American Agriculturist a year. Try it! It will cost you but \$1.50, (less than 1/4 a cent a day, which is easily saved,) and much less if you get three or more others to join you in a club.

SPECIAL—ONE.—To each NEW Subscriber, who remits 25 cents extra (for mounting, postage, etc.) the Publishers will send, mounted, packed, and prepaid, a **BEAUTIFUL CHROMO**, viz: "Up for Repairs," or "Mischief Brewing," but the choice must be named at the time of subscribing.

SPECIAL—TWO.—Extra.—Every subscriber for 1875 (Vol. XXXIV) received in November, 1874, will be entered at once, and receive, without extra charge, the December number of 1874. Thus, those subscribing in November, 1874, for the year 1875, will have the paper 13 months for 12 months' price.—Those subscribing at any time for 1875, will get many times their money's worth in a year's numbers of this superb Journal. The hints of a single page are often worth far more than the price for a whole year.

To ALL, we say, for American Agriculturist,

**You are Invited
To Try it a Year,
And thus Prove its Value;
It will Pay You,
And Pay You Well.**

Send subscription price, single or club, with postage (10c.) by Check or Draft on New York Banks (or P. O. Money Order,) payable to the Publishers, or Registered Money Letters.
**Orange Judd Company, Publishers,
245 Broadway, New York.**

AND NOW
ABOUT
"Doing Good AND Making Money,"
ALSO ABOUT
Large Pay for Little Work.

I.—If by your solicitation you persuade another to take and read the American Agriculturist, you will do him a POSITIVE GOOD. This Journal will benefit him many times its cost—and the Publishers will reward you as follows:

II.—They have selected with great care, and collected a very fine assortment of very useful and very desirable articles, good for one's own use, or for ready cash sales. Every article is

first-rate—new, well made, direct from the chief manufactory of each. See List of them in the Table of Premiums, next page, and especially Descriptions and Illustrations of them on the following pages.—By large cash wholesale purchases, and by other favorable arrangements, the Publishers have secured these good articles on extraordinary terms and guarantees, and are thus able to supply them very advantageously, viz., they give them away to their friends, who cooperate with them in introducing this valuable Journal into other families—which can be done with little time or trouble, and for which the reward or pay will be large, as detailed further on. Some of the articles are given for obtaining as few as 3 subscribers at only \$1.50 a year.

N.B.—Their facilities for getting these good premium articles, referred to above, are such that the publishers can generally afford twice as much for getting subscribers, by giving these premiums, as they could possibly pay in cash, while the articles offered are just as good as so much money, or in most cases better than money, on account of their special value, and they can be readily sold for cash.

N.B.—Under similar, and even less favorable offers, many persons have canvassed for subscribers as a business, receiving the Premiums, and selling them for cash, and they have thus secured salaries ranging all the way from \$200 to \$3,500 a year, and this for working only part of the time. (We quite recently met a Mechanic on a steamer, who assured us that our paper, furnished him by one of our lady canvassers, had been worth hundreds of dollars. As she made over \$2,000 a year, by receiving and selling our Premium Articles for Subscribers which she obtained, she certainly "made money and did good" at the same time—and this is only one of many cases.) But

Any One Anywhere

can collect and send us few or many names of subscribers, and receive a corresponding article, (one or more of them,) from our Premium List. Some start for large premiums, but, being otherwise occupied, they stop at a few names, and take any article offered for the number of names actually obtained. Others have started for a small premium, and finding the work very easy, have gone on, and obtained one or more of the most valuable articles. Every name sent for a Premium List, if so stated at the time of sending, is credited to the sender, and he is supplied with any premiums his names are entitled to. **FURTHER**, while names should be sent in as fast as secured, so that the subscribers may begin to receive the papers, the canvasser can have any time desired for enlarging or completing a list, up to **July 1st, 1875**, but he can call for any premium he is entitled to at any time before, and it will be promptly forwarded. See "Explanatory Notes."

Easy Work.

The collection of subscribers is very easy, as the paper is so cheap and valuable, that almost all will take it, if it is brought to their notice and its value properly explained.

More than **Fifteen Thousand Persons**, Men, Women, and Children, in all parts of the Country, and in almost all stations of life, have been successful in securing from one to a dozen or more of these Premiums, and with general satisfaction and pleasure. As many as **1,000 to 1,300** subscribers have been sent from single Post-offices by our pre-

mium canvassers. There are few Post-offices where there are not families enough who ought to have the American Agriculturist, to make up half a dozen larger or smaller Premium Clubs.

Many LADIES have been successful in getting Sewing machines, and other household articles; others make their entire living by canvassing and selling the articles. Some are annually laying up money in this way. (We have canvassers, who have worked thus for a dozen years or more.)

Many BOYS and GIRLS have been quite successful in securing Dictionaries, Melodeons, and many other articles for themselves, and for presents.

SCHOOLS often unite their efforts and secure Melodeons for their rooms, teacher's presents, etc.

CLERKS in Stores, Post-Offices, etc., have excellent opportunities, and many of these have obtained Watches and numerous other good articles.

Many MARRIED MEN have quietly gathered clubs of subscribers, and surprised their wives with a Sewing Machine, articles of Silver Ware, etc.

Many YOUNG MEN have done the same thing for female friends.

MEMBERS OF CHURCHES have united their efforts in making up clubs of subscribers, and obtained Sewing Machines for the Pastors, Melodeons for the Churches, or Sunday School rooms, etc.

Many SOLDIERS' WIDOWS, and poor Tailors, have received Sewing Machines for clubs raised by a few kind hearted neighbors.

FARMERS' LIBRARIES have been obtained for common use by the combined efforts of a few persons in a neighborhood, who have made up a premium club of subscribers, and received our Rural Books.

AGRICULTURAL SOCIETIES have subscribed for a premium club, giving the paper out as premiums to exhibitors, and received a Reaper, a Melodeon, or other article, from us, exhibited it at the Fairs, and then sold it at auction. Sometimes they raise subscriptions among members, and turn over the money received for the sale of the premium to the general fund.

MERCHANTS often make up clubs in their stores, and obtain the premiums for themselves.

MERCHANTS, SHOE-MAKERS, TAILORS, and others, have subscribed for a whole premium club, given a subscription to any customer buying \$10, \$15, or \$20 worth of goods, and retained the premiums themselves.

And NOW

Let us look at some of the Premiums which are offered. The next Table tells the name and cash price of each article, and, (in the last column but one), gives the number of names sent in at the regular price of \$1.50 a year that will secure any premium article. (The last column gives the number of names at the lowest club price for 20 or more names, that is \$1 each. Some persons quickly raise large clubs by taking all the names at \$1 each, and themselves pay the difference, 50 cents each, and thus get the premium articles very cheaply.)

Explanatory Notes. N. B.

Read and carefully Note the following items: (a) All subscribers sent by one person count, though from several different Post-offices. But....(b) Tell us with each name or list of names sent, that it is for a premium....(c) Send the names as fast as obtained, that the subscribers may begin to receive the paper at once. You can have any time you wish up to next July, to complete your list....(d) Send the exact money with each list of names, so that there may be no confusion of money accounts....(e) Old and new subscribers all count in premium clubs, but a portion, at least, should be new names; it is partly to get these that we offer premiums to canvassers....(f) Specimen Numbers, etc., will be supplied free, as needed by canvassers, but they should be used carefully and economically, and where they will tell....(g) Remit money in Checks on New York Banks or Bankers, payable to

order of Orange Judd Company, or send Post-office Money Orders. If neither of these is obtainable, Register Money Letters, affixing stamps both for the postage and registry; put in the money and seal the letter in the presence of the Post-master, and take his receipt for it. Money sent in any of the above ways is at our risk; otherwise it is not.

Table of Premiums.

[In the following table is given the price of each article, and the number of subscribers required to get it free, at the regular rates of \$1.50 a year, and also at the club rates of \$1 a year.] Description of Premiums on next pages.

Table of Premiums and Terms For Volume 34-(1875). BEGINNING NOW. Open to all-No Competition. Includes list of items like Tea Set, Ice Pitcher, Casters, Cake Basket, etc., with prices and subscriber requirements.

Holder—tasteful enough for the most stylish mansion—all beautiful, of uniform design, late pattern, with raised and embossed figure work. They are none of the common cheap silver-washed stuff that will look finely so long as unused, but are the best triple-plate on white metal. (See notes on plated ware, just below.) For all practical purposes, and for ornament, they will be as good as solid silver, for years. No Premium we have

Premium 1

supplied has been more commended than these articles in premiums 1 to 10. This No. 1, (and the others also), afford to a multitude of persons a rare opportunity to get beautiful and useful articles for home use and for marriage and other gifts. It will be comparatively easy to collect names of subscribers enough to secure one or more of these articles. A large number of persons have done so. JUST HERE, we append

A few Hints about Silver Plated Ware.

By the Electro-process it is possible to spread a single silver dollar over hundreds of square feet of surface, and cover it so perfectly that nothing but pure silver will be seen, but the thin film quickly wears off. By the same process continued, the silver coat may be put on to any desired thickness. It will be seen, then, that the real value of plated ware depends mainly upon the honesty and integrity of the manufacturer. We would hardly take as a gift much of the plated ware sold in the general market. Some of those articles can be bought very low, but they are very dear. As a security to our readers, and for our own good name, we get all our silver ware premiums from the LUCIUS HART MANUFACTURING COMPANY, 4 & 6 Burling Slip. They warrant each article supplied to us to be the best Triple-plate, such as we have ourselves used many years with great satisfaction. N. B.—These articles are also made of a strong white metal base, so that if by accident, or long hard use, the heavy silver plate should wear off at any point or corner, it shows very little. The late LUCIUS HART, the "Veteran Sunday School Man," was engaged in the same place and business for nearly a quarter of a century, and we know he cared more for good repute and integrity than for profit. The Company which bears his name, (and includes some of his family), we believe to be actuated by the same high motives, with a determination to sustain his high reputation, and we feel great satisfaction and confidence in supplying premium articles manufactured by them, and we believe we do our readers a favor in offering them these articles, viz—Premiums 1 to 10.

No. 2.—Ice (or water) Pitcher.—(See Engraving.)—A large highly Ornamental Article, that will adorn the table, as well as serve a very useful

Premium 2

purpose, and last many years, with no danger of breakage. It is of the same make, same metal, plating, etc., as No. 1.—For 32 subscribers, at \$1.50 each, we will send the Pitcher and a round Salver, of pattern to correspond, (value \$21.00).—For 44 subscribers we will send the Pitcher and a large 16-inch Oval Salver (value \$30), which is large enough to hold the Pitcher and two

Every Premium article is new and of the very best manufacture. No charge is made for packing or boxing any article in our Premium List. The Premiums, Nos. 12 to 18, 22 to 26, 29 and 30, 33 to 43, and 59 to 90, inclusive, will each be delivered FREE of all charges, by mail or express (at the Post-office or express office nearest the recipient) to any place in the United States or Territories.—The other articles cost the recipient only the freight after leaving the manufactory of each, by any conveyance desired. See Descriptions Following:

PREMIUM No. 1.—A splendid Tea Set of six pieces, full size, viz.: a Coffee Pot, a Tea Pot, a Sugar Bowl, a Cream Cup, a Slop Bowl, and a Spoon

goblets.—For 51 subscribers, we will send the **Pitcher**, the **Oval Salver**, and a pair of beautiful **Goblets**, silver without, and *gold-plated* inside, (value \$37.00). This *Complete Set* is exceedingly desirable, though the Pitcher alone, or that with the Round Tray, or the large Oval Salver, will answer well for *use or ornament*.

Prem. 3

No. 3.—Casters.—A handsome pattern, richly chased, containing four casters and mustard bottle—useful, necessary, ornamental for every dining table. The engraving does not show its full beauty. It is from the same makers, and of same metal and plating, as No. 1.

Premium 4

No. 4.—Cake Basket.—An elegant pattern, oval-shaped, nicely chased—a very taking, *useful*, and *beautiful* table ornament—is just the thing every one wants. From same makers and same metal as No. 1.

No. 5.—Revolving Butter Cooler.—(See Engraving.)—This is a really good and useful article, as well as an ornamental one. It is so arranged that a very little ice in the holder under the plate will

Premium 5

keep butter cool and fresh for a long time on the table, even in the hottest weather. The cover revolves, turning underneath the plate, out of sight when the butter is wanted, or over it as shown in the engraving, to protect the butter. The bright surface reflects outside

warmth, and prevents radiation, thus keeping the butter cool. The whole is in four pieces, which can all be taken apart for washing. Same metal, from same House as No. 1.

No. 6.—One Dozen Tea-Spoons.—**No. 7.—One Dozen Table-Spoons.**—These are "figured tips," *Olive-leaf pattern*, all of the same metal, plating, etc., and from same makers as No. 1. They are as beautiful and as serviceable for years, as solid silver spoons. See notes above about plated ware. These spoons are far *cheaper* than any others we have found at half the price, and *are well worth canvassing for*.

No. 8.—One Dozen Table-Forks.—*The same description and remarks apply to these as to No. 6.* We select as Premiums only such articles as we can warrant in quality and price, and such as are serviceable.

No. 9.—Child's Cup.—(See Engraving).—A beautiful gift for the Little One. Triple-plated on the outside, and *gilded* on the inside. It never breaks, and will last for many years—indeed, be a *life-keepsake*. Obtain only 7 subscribers, (as noted in Premium Table, page 435.) and you can secure one of these beautiful cups for your own child, or a name-sake, or other favorite.

Premium 9

No. 10.—Child's Knife, Fork and Spoon.—This is also a beautiful gift for a child. The articles are triple-plated, finely figured with *ivy-leaf pattern*, and put up in a *handsome silk-lined morocco case*.

All of the above ten Premiums are made and warranted as represented, the best triple-plate on white metal—by the LUCIUS HART MANUFACTURING COMPANY, referred to in the notes about Plated Ware on page 435.

No. 11.—Moore's Floral Set.—This is a beautiful Premium—a complete set of **Ladies' or Children's Garden Tools**, for the cultivation of flowers, consisting of a *Floral Hoe, Spade, Fork and Rake*, (as shown in the engraving). They are made of the *best steel and iron*, with finely polished *hard-wood handles*, light, durable, and highly finished, and each set inclosed in a box. They will be found very convenient in the garden and greenhouse. They are *useful* pleasing toys for the little folks, requiring only 3 subscribers to get

Premium 11

them free. Better get more subscribers, and secure half a dozen sets, or more, for others to come with yours, as they can all come cheaply as freight. Made by the MOORE MANUFACTURING COMPANY, Kensington, Conn.

Nos. 12, 13, 14.—Gold Pens: with *ever-pointed Pencils, in extension, coin-silver cases.*—(The engraving shows the different parts of the pen, holder, and pencil. The pencil portion contains a magazine of black lead points.—Premium No. 12 contains the best No. 4 Gold Pen; and No. 13 the best No. 6 Gold Pen, which is the same style, but larger. No. 14 contains No. 7 Gold Pen, in Gold-tipped Ebony Holder. *Each pen will be sent in a NEAT LEATHER CASE by mail, post-paid.* (When ordering, please indicate whether a *stiff, or limber, or medium* pen is desired. If desired, after trial but not use, a pen can be returned by mail, registered, and exchanged for one of different stiffness, by enclosing 3 cents for postage on exchanged pen. These pens are

Premium 12

made by G. F. HAWKES, 66 Nassau St., and have obtained an excellent reputation. We have known the maker and his goods many years, and highly recommend them.

No. 15.—Ladies' Fine Gold Pen, in *Rubber Case, Gold Mounted*, with *Screw Extension*, and *Gold Ever-pointed Pencil*. A beautiful present for a lady teacher or friend. From the same maker as No. 12.

Nos. 16, 17.—Paragon Patent Revolving Pencil.—This is a beautiful Pocket Pencil, which is extended or closed by pulling or pressing the head. The engraving shows the pencil closed for carry-

Premiums 16, 17

ing suspended from a chain if desired; also shows it opened for use. Simply pulling the ring, lengthens the case, and throws out the pencil. They are made with great care, and every Pencil warranted to work perfectly. They are *gold-plated*, and will last for years. We offer two patterns, one for ladies, with ring for chain, at \$1.50 each, and one of heavier and firmer plate, at \$3. From same maker as No. 12. Only 4 or 8 subscribers required.

No. 18.—Payson's Indelible Ink, and Briggs's Marking-Pen Combination.—(See Engraving.)—Payson's Indelible Ink is too well known to need further commendation. It is almost indispensable in the family. Briggs's Marking-Pen has been before the public for fifteen years, and is justly celebrated for all kinds of marking, and particularly for writing upon coarse fabrics. The Pen and Ink bottle are put up in a neat box-wood case; the glass pen joints in the middle and fits inside the case. The whole is thin, portable and always ready for use, and protected from injury by evaporation or breakage. We have used this pen and ink for several years with entire satisfaction.

Premium 18

Premium 19

No. 19.—Child's Carriage, or Perambulator.—An elegant carriage, handsomely finished, upholstered with *seps*, has full plate *tinmed joints, handle tips, side lights, dash rail, panel body, and carpet* on the bottom—all well made. A beautiful thing for use, or for a Gift, or for Sale, and easily obtained *free* by a few evenings' canvass. These carriages are from the well-known manufacturer, C. W. F. DARE, 47 Cortlandt st., N.Y.

Premium 20

No. 20.—Child's Patent Propeller or Self-Operating Swing.—A pleasing thing for

a little boy or girl. The seat of the swing is upholstered with enameled cloth, showily painted, and hooks and all complete accompany it—ready to be suspended anywhere, where the four hooks can be driven over-head. When it is hung up, the hooks over-head to which the lever ropes are attached, must be set about one foot in front of the hooks to which the main ropes are attached. A child is delighted with being able to swing himself by simply pulling and pushing the handles. Nine subscribers easily obtained in an evening or two, will secure one free. From C. W. F. DARE, 47 Cortlandt St., New York.

No. 21.—Doll's Cottage Chamber Set.—Eight pieces of furniture, prettily painted: *Bedstead* (size 11¼×18 inches), *Bureau*, *Table*, *Commode*, *Towel-rack*, *two Chairs*, one *Rocking-chair*. Will occupy and please the little Girl, and give her early lessons of order in housekeeping. A free set requires only a dozen subscribers. Many Boys can each collect twelve subscribers, and get this Premium as a present for a little Sister or Cousin. We have many successful little canvassers. Made by C. W. F. DARE, 47 Cortlandt St., N.Y.

Premium 21

No. 22.—Crandall's Improved Building Blocks furnish a most attractive amusement for children. Churches, Dwellings, Barns, Mills, Fences, Furniture, etc., in almost endless variety, can be built with them, and the structures remain so firm as to be carried about. For developing the ingenuity and taste of children they are unequalled. The Blocks are put up in neat boxes, accompanied by a large *Illustrated Sheet* giving various designs of buildings, etc. This is one of the most successful toys ever invented.

No. 23.—Crandall's Masquerade Blocks.—These are put up in boxes; the blocks in each box will make, by various combinations, 300 different pictures in brilliant colors. They are not injured by washing, and afford endless amusement for children. They are very beautiful gifts for the little ones.

No. 24.—Crandall's Acrobats.—The most attractive, amusing and wonderful Toy of the age. Children everywhere, who have seen the Acrobats, are delighted with them. Thousands of figures can be made from the pieces in a single box. The pieces are variously colored, and there is no end of fun in a box of them. If you take your premiums in other articles, don't fail to buy the children a box of these Acrobats. Most dealers in Toys are getting them, as fast as they can be supplied. The manufacturers are now making and selling about 1,500 boxes a day, so popular is this new Toy and so great is the demand for it.

No. 25.—Pocket Tool Holder.—(See Engraving.)—Every boy (or man) will be glad to get hold of this Premium. We have kept a similar, but less

Premium 25

perfect set in use many years, and found it very convenient for a thousand little jobs. In a maple handle, which is hollow, with a lignum-vite head, are packed twenty miniature cast-steel tools, any one of which may be quickly adjusted to the handle. It will also grasp and hold for using anything from an 8-inch mill-file to a cambric needle. These are made for us by the MILLER'S FALLS MANUFACTURING Co., 78 Beekman St., New York.

No. 26.—Bracket Saw.—(See Engraving.)—Although this is a little thing, size of frame being about 6×12 inches, it is sufficient for the manufacture of very many ornamental and useful articles, as Book Rests, Brackets, Boxes, etc., which the ingenuity of any person, young or old, may devise. The frame is rosewood highly polished, and the saws of tempered steel, four of which, with *Designs and Directions*, are sent with the frame. The Boy (or Man) will spend many an hour with this, which might be worse employed, and not only develop ingenuity and skill, but also turn out useful and or-

naimental articles. We have seen a humble Parlor wholly adorned with brackets, frames, shelves, etc., which were mainly prepared by father and son from the wood of cigar boxes, with some from cedar and other shingles, and thin boards. The room was as attractive and pleasing to us under the circumstances, as some other drawing-rooms furnished with costly brackets, etageres, etc., at a cost of many hundreds of dollars. Four subscribers only will secure this Bracket Saw free. Made by the MILLER'S FALLS MANUFACTURING Co., 78 Beekman St., New York.

Prem. 26

No. 27.—"People's Pump."—(See Engraving.)—What most country families need. An indoor Force Pump for 1¼ inch Suction Pipe; capacity 15 to 18 gallons per minute. These pumps are tested to 150 pounds pressure, and will throw water from a hose pipe 50 feet high, and 80 feet horizontally. Being operated by a side shaft entering through the air-chamber, there is no piston rod to wear out brass stuffing box as in other pumps. They are among the most powerful, simple, and durable pumps to be had. The ease with which any part can be renewed in case of accident, or access had to the interior for repairs, commends them for greenhouses, farmers, and stockmen, as well as for city use. Awarded Medal of American Institute, as the Best Force Pump of all exhibited, Nov. 15th, 1873. None genuine without "People's Pump, Patented Aug. 31st, 1869," cast on the lid. Send for a descriptive circular to W. S. BLUNT, MANUFACTURER, 77 Beekman St., New York, and secure a free one through us for your own use, (or for sale at \$12.) by simply sending us 19 subscribers, which you can readily collect during a very few evenings or rainy days.

Premium 27

No. 28.—Non-Freezing Out-door Force Pump.—This is another style of the popular "People's Pumps," and by the same manufacturer. The description of Premium No. 27, is also applicable to this, and while that is designed for in-door, this is for out-door service. For seven additional subscribers at \$1.50 each, we will send, with either of the above pumps, four feet of hose, with couplings, and brass hose-pipe, price \$3.

No. 29.—Excelsior Pocket and Dissecting Microscope.—(See Engraving.)—The microscope reveals to us a beautiful world unseen by the unaided eye, and hardly conceived of, until one has the microscope before him. One of these instruments (the best obtainable) ought to be in every family, in country and city. It will furnish rational amusement for old and young, diverting the mind from baser pleasures, enlarging the conception of the skill and wisdom displayed in creation, to say nothing of its usefulness in examining and detecting a multitude of noxious insects. We have long sought an instrument of this kind that, while complete enough to be of any use, would be cheap enough for general introduction. That which we now offer, though not having the power and appliances of one costing \$20 to \$100, or more, is yet very valuable and serviceable for the price, and the best we can obtain for any

Premium 29

thing like the cost of this, and we are happy in being able to supply such an instrument free to every one, sending us barely seven subscribers. (Each of the subscribers

will get many times his money's worth in the paper itself, while the canvasser will have his microscope free, and can use it in interesting the others. So in this case, as with all the premiums, the canvasser will "Do Good and Make Money," or get what is as valuable as money, or more so.)—The Premium Microscope (shown in the engraving,) is supplied with three Lenses, and is packed in a neat case for the pocket. It is patented by J. T. Bausch, of Rochester, N. Y., and is manufactured by the VULCANITE OPTICAL INSTRUMENT Co., and it is for sale by the dealers in optical instruments generally.

No. 30.—Pocket Soap Bubble Toy.—We enjoy seeing children blowing soap-bubbles. There is much philosophy involved in the whole operation, besides the skill of manipulation—but we must leave the Children's Editor to discuss the "philosophy" of it in the Children's Columns. The little toy offered is much superior to the clay pipe, and will greatly please all the boys and girls. Two of these toys will be given for this premium, and almost any child can readily get 3 subscribers at \$1.50 each, and thus secure one of these for himself, and another to give away. It may be carried in the pocket, and can be used for blowing bubbles indoors or out. Directions accompany each one. Manufactured by S. B. BLISS, 34 Barclay street, New York.

Premium 30

No. 31.—Turn-table Apple Parer, Improved.—(See Engraving.)—**No. 32.—Climax Apple Corer and Slicer.**—**No. 33.—Family Cherry Stoner.**—All the above machines, which are most useful in every household where apples and cherries are to be cared for, are manufactured by D. H. GOODELL, Antrim, N. H., and 99 Chambers street, New York. We have never seen the work for which these machines were contrived, more rapidly or better done, than they will do it. The Apples are pared, cored, and sliced with the greatest facility, and the Cherries are readily relieved of their stones, leaving the fruit in good shape. Only three subscribers are re-

Premium 31

quired to get any one of these, or nine subscribers for the whole of them, free. See Premium Table.

An Illustrated Supplement

containing full descriptions of all our Premiums, 1 to 90, will be sent free to all applicants. We have room here for only Nos. 1 to 33. We ask each of our Old Readers to kindly call attention to this fact, and either to raise a club of subscribers, and secure one of these useful and valuable Premiums for himself, or put some friend or neighbor in the way of doing the same. It is Light Work for Good Pay.

THE TORSION SPRING

in its various applications as
**WAGON SPRING,
 SEAT SPRING,
 and
 TONGUE SPRING,**
 has been in use over Six Years, and for the last two years has obtained an enviable reputation wherever introduced. The principle of applying the elastic properties in the

Twist or Torsion of a Steel-Rod to mechanical purposes, has long been in familiar use as a door spring, but not to any great extent for other purposes till a recent date. Its simplicity, and the ease with which it can be applied to nearly all purposes, for which a spring is used, can not fail to produce an entire revolution in the manufacture of springs. It has been subjected to the severest tests, which were possible to apply, and has passed through the ordeal with a success gratifying and complete.

It was awarded the **First Premium and Medal** over the Elliptic and all other competitors, at the American Institute, New York City, in November, 1870. It is now being applied by the War Department to Government Wagons going on the Plains.

1. It occupies but little space.
2. It is light, weighing from 25 to 60 pounds complete.
3. It is sold very much lower than the common spring.
4. It can be applied to any kind of farm wagon, without change of construction.
5. A wagon will weigh from 400 to 1,500 pounds less, than when supplied with the common truck spring.
6. It can be instantly removed.
7. A wagon will last two or three times as long, when used with the **Torsion Spring**.
8. Twenty per cent greater loads can be carried by a wagon using it.
9. A horse can draw twenty per cent more on a wagon with this spring than without.
10. It never loses its elasticity.

THE AMERICAN DAIRY SALT COMPANY,

SOLE MANUFACTURERS OF THE

ONONDAGA FACTORY FILLED

DAIRY & TABLE SALT,

AT SYRACUSE, N. Y.,

Respectfully call the attention of Dairymen and others to the quality of the salt now being manufactured by them. Having for many years past been engaged in perfecting the various processes for the manufacture of this salt, and by adopting the best modes and machinery for the purpose, they feel warranted in saying to the consumer that the article now produced is superior to any other either of foreign or domestic production. The following is a correct analysis of our salt and also of the celebrated Ashton's English Salt, made by Chas. A. Goessmann, Ph. D., Professor of Chemistry in the Massachusetts Agricultural College at Amherst, Mass.:

	Ashton Salt.	Onondaga Factory Filled.
Chloride of Sodium.....	97.65	98.28
Sulphate of Lime.....	1.43	0.91
Sulphate of Magnesia.....	0.05	.06
Sulphate of Soda.....	.00	.00
Insoluble matter.....	.05	.12
Water.....	.76	.60
	100.00	100.00

Circulars in regard to various tests made with this salt in comparison with the best foreign article, also certificates from a large number of the best dairies in the State as to its quality, may be had on application to J. W. BARKER, Secretary, Syracuse, N. Y., to whom orders for salt may also be addressed.

It is also for sale by the Agents of the Company in principal Western Lake Ports, by ST. JOHN & AVERY, 101 & 103 Broad St., New York; ROBERT GEER, 109 Pier, Albany, N. Y., and by Salt Dealers generally throughout the State of New York.

Inquire for *Onondaga Factory Filled Dairy Salt*.

IMPORTANT TO INVENTORS.

American Agriculturist PATENT DEPARTMENT

In compliance with the request of numerous inventors, we have organized a

PATENT DEPARTMENT

in connection with this office for the transaction of all business connected with

Securing Patents

in the United States and foreign countries.

The character for

Reliability

which has been maintained by the AMERICAN AGRICULTURIST for more than thirty years will be carefully guarded in this as in other departments.

All Inventors

desirous of procuring patents at moderate cost are invited to forward (express prepaid) a model of their invention, with a brief description of its working. The model should not exceed one cubic foot in dimension. Upon receipt of model an opinion as to patentability will be given free of charge.

Preliminary Examination

at the Patent Office, to determine patentability, will be promptly made for a fee of \$5.

Litigation of Patents.

The services of the best counsel have been secured to prosecute or protect before the U. S. Courts and the Patent Office the claims of those intrusting their business to this agency.

Specifications, drawings, engravings, models, and all other appliances furnished at moderate prices.

In all dealings with this Department inventors may depend upon promptness, fidelity to their interests, and the best services which can be rendered by thorough experts. For full particulars, address

**AMERICAN AGRICULTURIST PATENT DEPARTMENT
 ORANGE JUDD COMPANY,
 245 Broadway, New York.**

PRAIRIE, CORN-FIELD AND HERD OF CATTLE, SIX MILES WEST OF LINCOLN, NEB.

IF YOU WANT A FARM OR HOME,
 YOU SHOULD BUY OF THE
BURLINGTON AND MISSOURI RIVER RAILROAD CO.
 IN IOWA OR NEBRASKA.

- BECAUSE**—Their prices are low, ranging for the best land from Three to Ten Dollars per acre.
- BECAUSE**—No payments are required of the purchaser for four years, except interest at six per cent.
- BECAUSE**—After the fourth year only *one seventh* of the principal is payable annually till the whole is paid.
- BECAUSE**—You are not required to go into a wilderness, these being well-settled States, the population of which is rapidly increasing.
- BECAUSE**—The mildness of the climate and fertility of the soil is such that the settler can pay for his farm from the products raised upon it long before the time when the principal becomes due.
- BECAUSE**—Failure of crops from drought is unknown.
- BECAUSE**—Large allowances are made upon fare and freight, thus giving low rates on both to purchasers of this Company's lands.

AND YOU SHOULD BUY THIS YEAR.

BECAUSE—Purchasers of our lands in Nebraska during 1874 who cultivate one-half their land within two years from their purchase are allowed a *reduction of twenty per cent* on its price. **LARGE DISCOUNTS** also, FOR CASH, within One, Two, or Five Years.

Send for Circulars, with full information on all points, to

GEO. S. HARRIS, Land Commissioner,

At Lincoln, Nebraska, for land in Nebraska. At Burlington, Iowa, for land in Iowa.

Or to **W. D. COWLES, General Agent, 317 Broadway, New York.**

JAS. R. WOOD, General Agent, 59 Clark St., Chicago, Ill.

IMPROVED FOOT LATHES.

Small Engine Lathes, Small Gear Cutters, Hand Planers for Metal, Ball Turning Machines, Slide Rests, Foot Scroll Saws for light and heavy work, Small Power Scroll Saws, Foot Circular Saw Machines. The very best. Many readers of this paper have one of them. Catalogues free.

N. H. BALDWIN, Laconia, N. H.

Just the articles for Artisans or Amateurs.

CELEBRATED FERTILIZERS.

Pure Bone Superphosphate of Lime. GROUND BONE, BONE MEAL, BONE FLOUR.

The large annual increase of the sales of these **Standard Fertilizers** is the best proof of their merits. Their freedom from adulteration, with every particle available for fertilizing, and the low price at which they are sold make it for the interest of every practical farmer to give them a fair trial.

LISTER BROTHERS,

RICH FARMING LANDS

For Sale VERY CHEAP by the

UNION PACIFIC RAILROAD COMPANY

MILLIONS OF ACRES

IN THE

STATE OF NEBRASKA

AT PRICES RANGING FROM

\$2 to \$10 per Acre.

**FIVE AND TEN YEARS CREDIT GIVEN,
With Interest at Six per Cent.**

Convenient to Markets East and West.

The Lands of the Union Pacific Railroad Company are the odd numbered Sections for twenty-miles on each side of the road. They are located in the valley of the Platte and its tributaries—a region widely celebrated for its beautiful scenery, rich productive soil, and mild and healthful climate. The winters are short, and the atmosphere dry and invigorating. Epidemic diseases are unknown. The surface is undulating, covered with nutritious grasses, and watered with numerous clear running streams. All the productions of the Eastern and Middle States are grown with success. Wheat and Corn are the staples, and it is well adapted to the cultivation of Fruit. For Stock-raising, in all its branches, these lands are unsurpassed. The Union Pacific and its branch railroads furnish market facilities unequalled. Education is free. One-eighteenth part of the entire area forms a permanent endowment of the Public Schools. Good Society, Schools, Churches, Post-Offices, Mills, Stores, and other advantages of civilization are enjoyed.

The liberal provisions made for Education, the freedom from State debt, the rapidity with which this section is settling, the numerous towns and villages springing up, offering inducements to the merchant, farmer, and mechanic, render this tract a most desirable location for the industrious man of limited means to secure a comfortable home, and acquire competence, independence, and position.

These lands are granted directly to the Railroad Company. The title given to the purchaser is absolute, in fee simple, free from incumbrances.

They are sold in tracts of forty acres and upwards, giving the man of small means an equal chance with the capitalist to make a safe and profitable investment, one which can not be destroyed by fire or flood, a provision for future support, not affected by *revulsions*, or liable to the fluctuations of stocks.

Full information in reference to particular localities will be furnished, good lands selected, and sales made, free of charge, for persons not desiring to incur the expense of coming to examine the lands in person.

ALSO

THE PIONEER,

A handsome ILLUSTRATED PAPER, with Maps, etc., and containing the HOMESTEAD LAW, mailed free to all applicants, by addressing

CHICAGO & NORTH-WESTERN RY.

THE TRANS-CONTINENTAL ROUTE.

This is the Pioneer line between Chicago and the Pacific Coast, and was the first to connect with the great Pacific roads, and form the OVERLAND ROUTE. This line is the shortest rail line between Chicago and Omaha; the track is of the best steel rail, and is well ballasted, and as free from dust as a road can be made; the bridges are strong and durable; and all the appointments are first-class in every respect. The trains that run over this line are made up of elegant new Pullman Palace Drawing Room and Sleeping Coaches built expressly for this line, luxurious, well lighted and well ventilated Day Coaches, and pleasant lounging and smoking cars; all built by this Company in their own shops. The cars are all equipped with the celebrated Miller Safety Platform, and patent Buffers and Couplings, Westinghouse Safety Air Brakes, and every other appliance that has been devised for the safety of passenger trains. All trains are run by telegraph. In a word, this GREAT CALIFORNIA LINE has the best and smoothest track, and the most elegant and comfortable equipment of any road in the West; and has no superior in the country. It is eminently the favorite route with Chicagoans traveling west, and is acknowledged by the traveling public to be the popular line for all points in Western Iowa, Nebraska, Wyoming, Colorado, Utah, Montana, Idaho, Nevada, California, and the Pacific Slope.

All Coupon Ticket Agents sell tickets by this route. If you are going West, you should try this route.

THE REMINGTON WORKS, ILION, N. Y.

REMINGTON

Sewing Machines, Fire Arms, Agricultural Implements.

The REMINGTON SEWING MACHINE has sprung rapidly into favor, as possessing the best COMBINATION of good qualities, namely: Light running, smooth, noiseless, rapid, durable, with perfect Lock Stitch.

It is a Shuttle Machine, with Automatic Drop Feed. Design beautiful and construction the very best.

REMINGTON No. 1 Machine for family use, in the *third year of its existence*, has met with a more rapid increase of ratio of sales than any machine on the market.

REMINGTON No. 2 Machine for manufacturing and family use, (ready for delivery only since June, 1874), for range, perfection, and variety of work, is without a rival in family or workshop.

AGRICULTURAL IMPLEMENTS.—Improved Mowing Machines, Steel Plows, Steel Hoes, Cultivators, Road Scrapers, Patent Excavators, Hay Tedders, Cotton Gins, Iron Bridges, ETC. **Good Agents Wanted. Send for Circulars.**

The REMINGTON WORKS also manufacture the new **Double-Barrelled Breach-Loading Shotgun**, snap and positive action, with *patent joint check*, a marvel of beauty, finish, and cheapness—and the **Celebrated Remington Rifles**—ADOPTED BY NINE DIFFERENT GOVERNMENTS—and renowned throughout the world for Military, Hunting, and Target purposes—ALL KINDS OF PISTOLS, Rifle Cases, METALLIC CARTRIDGES, ETC.

The score made by Lieut. Fulton at Creedmore Sept. 26th, 1874, with a Remington Rifle, was the highest ever made at any match, either in this country or in Europe.

1776 1876

INTERNATIONAL EXHIBITION.

OFFICE OF THE U. S. CENTENNIAL COMMISSION, PHILADELPHIA, PA.

In accordance with the several Acts of the Congress of the United States, providing for the celebration of the

CENTENNIAL ANNIVERSARY

of American Independence, there will be held in FAIRMOUNT PARK, Philadelphia, in the year 1876, an

INTERNATIONAL EXHIBITION

of Arts, Manufactures, and Products of the Soil and Mine. The Exhibition will be opened on the 19th of April and closed on the 19th of October.

APPLICATIONS FOR SPACE.

To secure space for exhibits in the Buildings or the Park, early application should be made. The necessary forms for application, together with the Regulations for Exhibitors and needed information, will be forwarded on application to the Office of the Centennial Commission.

A. T. GOSHORN, Director-General.
J. L. CAMPBELL, Secretary.

Readily attached to any Stove. Introduced 8 Years. Thousands in Use. Once used, never dispensed with.

Agents Wanted at once in valuable Territory. Circulars on application. American Manufacturing Co., 102 Orange St., NEW HAVEN, Conn.

HOME CORN-SHELLER.

The best HAND SHELLER for family use in the market. Every machine warranted. Price \$2.50. Every Farmer and Poultry-raiser needs it. Agents wanted.

LIVINGSTON & CO., Iron Founders, Pittsburgh, Pa.

Wrought Iron Fencing of the Best English Make. Can be set up with ease—is an absolute protection against cattle—is ornamental, and practically indestructible. Is superior to every other form of enclosure. Send for illustrated circular. YARNALL & TRIMBLE, 147 S. Front St., Philadelphia.

INVENTORS

Who wish to secure PATENTS should write to MUNN & CO., 37 Park Row, New York, for Advice and Pamphlet, 103 pages, FREE.

Calendar for December.

Table with columns for Day of Month, Day of Week, and sunrise/sunset times for Boston, N. York, Philadelphia, and Washington.

PHASES OF THE MOON.

Table showing moon phases (New Moon, 1st Quart, Full Moon, 3d Quart) for Boston, N. York, Wash'n, Cha'ston, and Chicago.

AMERICAN AGRICULTURIST.

NEW YORK, DECEMBER, 1874.

With this number close both the volume and the year. December is especially a month for retrospection. As the days shorten, we return in mind to those longer and busier days which have passed. The farmer lives greatly in the future. His life is one of anticipation. He sows his seed and waits patiently for the harvest. He "learns to labor and to wait." But now that his land, with what crop it may be bearing, rests for a season, he naturally looks back over the closing year. There is profit in it if he does this wisely. We love to remember our victories, but it is more profitable to remember our mistakes and defeats. Even those of the greatest knowledge and experience are ever making mistakes. To wisely consider the mistakes of the year gone by, their causes and results, will help us to avoid similar errors in the future. Many a farmer now sees where his short crop, cut down by drouth, ravaged by insects, overpowered by weeds, might have been made a full one. This has been a year of disaster in portions of the west, and ruin—if a true man can ever be ruined—has come to some. Here too is matter for consideration. How shall the ravages of insects be repressed or mitigated? For no intelligent man is content to succumb to disaster, and to say it can not be avoided. There is a cure for every evil, and doubtless, many who have suffered have seen a way by which they may help themselves in the future. But, as a whole, the agricultural interest has no cause for complaint. If prices are low there is more to sell, and low prices tend to stimulate better methods of production. What we need more than anything else is not so much great crops, as crops cheaply raised. Cheapness of production is equivalent to a high selling price. It does not matter at which end the gain is made, so that a gain results. Cheap food is a great stimulus to general prosperity, and if by close observation or careful study, the farmer can profitably reduce the cost of his crops, the whole industry of the country is benefited. We can not avoid competition with other countries where laborers work for a bare subsistence, but we can by the use of machinery and improved processes, make one of our laborers do the work of three, live well, and lay up something towards buying a farm of his own. In looking over

our agricultural products, we must not forget to consider what kind of men we are raising, and when we look upon the general condition of the agricultural community, and find that the large farmer has not made large profits, it will be well to remember that every man in his employ is well housed, well clothed, and well fed; that his children go to school, and have any career open to them that they are fitted for, and that the man himself reads the papers, chooses his "rulers," and is looking for the not far-off time, when he himself shall be a land-owner. There is no reason for despondency, and the year closes upon a generally prosperous and always improving people.

Hints about Work.

Farm machinery now represents a large portion of the farmer's capital. Next to his land and live stock, his machinery costs the most money. Frequently it costs more than the live stock. It ought to be carefully used and kept. Whatever implement has not been thoroughly cleaned, oiled, and put away, should now be attended to. Machinery will be used more and more, and a man of intelligence can use it most profitably. Farmers should therefore study mechanics, not only that they may know how to use and care for their machines, but how to improve them and invent new ones. Many new agricultural machines are brought out, that are useless from the first, because the inventors knew nothing about agriculture. An inventor of a new plowing machine, acknowledged to us that he did not know that sod should be turned over when plowed. He had a machine that tore it into fragments and left it upon the surface. Farmers should be their own inventors, and in course of time they will be, if the young men study.

The Stables.—If our earlier hints have been regarded, the stables will now only need daily cleaning. Manure should not be left to freeze in hard lumps beneath the stock. The stables should be warm enough to prevent freezing in them, or the cattle will suffer loss, or more feed must be given. By wheeling out the manure the first thing each morning to the heap in the yard, and piling it up neatly and compactly, the whole may be kept from freezing during the winter, and it will be in fine condition for use in the spring.

Cellars.—Root cellars should now be made safe against frost. Protect the house cellar, but provide for ventilation.

The Dwelling House.—Porches for protection to the front and back doors will cost but a few dollars. They should be made so as to be fastened to the house by a hook and staple upon each side, and removed in spring. Weather strips are rarely seen in country houses, but they save much fuel, and add to the comfort. A good substitute may be made by cutting sheet rubber into strips, and nailing them around the doors and windows. Let an ample supply of dry wood be kept in the kitchen.

The Stock.—Liberal feeding is now needed. No stock should be allowed to lose now what they have made in the summer. On the contrary, they should be kept growing. And they may be by proper feeding. "He becometh poor that dealeth with a slack hand," is very true in this respect. There must be close attention to this matter, or money is lost in feed and in weight of stock. Don't trust too much to hired men or boys. Have exact measurements for the feed. A box to hold three quarts, should be in every feed bin. This makes a fair allowance for one ox or horse, or for two cows or four calves at each feed. A bushel basket of fine cut hay is an average for one horse or cow, or two calves at each feed. There should be no waste, but as much feed given as will be eaten up clean. Give salt regularly in small quantities, or have it accessible to the animals.

Milk cows will suffer from chapped teats, if they are not wiped dry after milking. Some warm water, a piece of soap, and a dry cloth, should be taken to the stable at every milking time. The teats and udder should be washed and wiped dry, previous to and after milking. If the teats are chapped, some fresh lard will soften and heal them.

Sufferers by the Grasshoppers or Locusts.—Though the accounts as to the extent of the damage by the insect visitation to some of our Western States are very conflicting, yet there is no doubt much suffering, and apparently more than can be relieved by local aid. It will be well in this holiday month for the prosperous to remember those who are suddenly deprived of food, or the means of procuring it. If all who have friends in Kansas, Nebraska, or other devastated States, would remember and help relieve their necessities, much suffering would be avoided.

Cheat all Around.—Some one sent to a wise man of Philadelphia a head of wheat, on which grew some cheat, or chess. Wise man sent an account of this wonderful freak of nature to the Tribune, which that paper was innocent enough to publish. Then some one did—what most persons would have done at first—give the specimen a careful examination. It was found to be a cheat in every sense of the word, made up, bogus. —Moral: Don't be in a hurry to announce discoveries.

As to Onions.—"G." Savona, N. Y. Onions could doubtless be made profitable as a field crop, but the cultivation would necessarily be simply enlarged gardening. It is useless to try to raise onions by the use of swamp muck, lime, or any such partial fertilizers. Plenty of good well-rotted barn yard manure will bring a crop on good loamy soil every year upon the same ground. No rotation is needed for onions.

Newly calved cows should be guarded against cold, and their drink should be slightly warm.

Sheep.—Irregular feeding will show in the wool. Every time the sheep falls off in condition, there will be a weak spot in the fiber, and the wool will snap there when stretched. Wool buyers don't neglect to look for this, and the wool loses 5 or 6 cents a pound in value, where they find it. Regularity in poor feeding, is not so bad as good and bad feeding alternately. The sheep do not suffer so much. Half a pint of grain a day will keep sheep in good condition, with good straw or sweet corn-fodder. A little sulphur in the salt is a preventive of "stretches," which is simply indigestion.

Corn-fodder.—When carefully cured, corn-fodder is by many regarded next in value to hay. To throw it in bundles into the yard, to be picked over and trampled under foot, is wasteful, and it is a nuisance when the manure is to be moved in the spring. When cut in a fodder cutter, a bushel of it mixed with meal, (1 to 3 quarts), makes an ample feed for a horse or cow. Stock may be kept in good condition with no other fodder through the whole winter, with great economy.

Fattening Animals.—There is a point beyond which it does not pay to feed either hogs, sheep, or bees. When they fall off in their feed, feed is wasted. As long as young animals will eat well, it may pay to keep them. But full grown animals when fully fat, will eat and eat and keep stationary. It is well to keep a watchful eye upon such.

Ditches.—Wherever water stands upon wheat or rye fields, furrows or ditches should be made to let it off. Drains should be made or looked to before the ground freezes up.

Pasturing Grain.—As a rule, too much of this is done. But where the wheat or rye is very thrifty, a few sheep may be allowed to run over the fields without injury. Where the grain is heaved with the frost, coming soon after a rain, a flock of sheep will trample thousands of the plants into the soil again.

Manure may be hauled at any time, but it should usually be spread as it is hauled, and not left in heaps.

Work in the Horticultural Departments.

With this month the out-door work is practically closed. An unusually mild season may prolong it a few days, or an open spell allow something to be done to facilitate spring work, but for the most part, the horticulturist may leave his orchards and his beds, and turn his thoughts towards another year. Those who have read the Ogden Farm Papers regularly, will recollect the account of an ignorant chap, who was fleecing farmers out of handsome fees by tasting their soil, and telling them how to improve it. The desire to improve, to make their soil more productive, on the part of the farmers, made the work of this plausible quack an easy one. If the writer of this should go among orchardists, market gardeners, or florists, and tell them that for \$1, \$1.50, or some such sum, he could show them how to make or save \$10, \$20, or more, he would, no doubt, find a large number to invest. He does that here, and charges nothing. His secret is, buy one book relating to your specialty, and study it. The editorial correspondence of the paper all comes under the writer's eye, and he is quite sure, from the questions asked, that not one in ten, who are trying to make money by growing fruits of various kinds, by vegetables, or by flowers, have a modern work upon their branch of horticulture. We do not write this because the publishers of the paper also publish books, but should say the same in any case. We are glad to answer questions in cases of particular difficulty, but can not write treatises. Nothing is more common than for us to receive a letter, asking us to tell "all about" this or that, which could not be told did we give the whole paper to it. Every year there come questions about pruning trees and vines, about budding and grafting, about cuttings and layers, which if answered as they come, would make it necessary to reprint the same matter year after year. We can understand

how this happens; hundreds, if not thousands, who have never taken a similar paper before, have a new field opened to them. They read that trees are grafted, and that vines are pruned, and raised from cuttings, and that there are many other horticultural operations they would like to know about. These things, while matters of course to many, are to these novices entirely unknown, and they wish to learn about them. Now a paper like the *Agriculturist*, can not keep repeating these fundamental matters, teaching A B C's, so to speak, to the minority, but must give agricultural and horticultural news, record progress, and show methods which presuppose a knowledge of first principles. Those of our readers who take a political paper, do not expect that it will give the Declaration of Independence, or the Constitution of the United States, in each issue; and their religious paper goes upon the belief that its readers know something of the Ten Commandments, The Sermon on the Mount, and other essential parts of the Bible. So we must assume that our readers know the simple operations of horticulture. The publishers have taken pains to procure the best general and special works in all departments of agriculture and horticulture. But "the cost"—that is the objection. We have cited the instance of the successful quack; with such fellows farmers do not find it difficult to pay the money, because they impudently promise much. We can not raise high hopes, and tell our readers that by buying such or such a book, they will make \$50, \$100, or more, but we have not the least doubt that any standard work to any farmer or gardener, will ultimately be worth these sums. It comes in our way to read all books upon rural matters that are published, and we have rarely met with one which, however crude and poor as a whole, did not have some suggestion or idea in it, that was worth the price of the book. Now when we come to the best books on horticulture, we are very sure that they are worth many times more than they cost. In fact, any one engaged in any horticultural pursuit for the purpose of profit, cannot afford to do without the best thoughts, the costly experience of men who have devoted their lives to, and have been successful in these very branches. It is as much a necessary part of the outfit, especially of a beginner, as trees, plants, seeds, implements, or manures; indeed, all these are comparatively worthless without the necessary knowledge to use them. We hold it to be quite impossible for one to intelligently start, and carry on to profitable results an orchard or fruit garden, without some such work as Barry's, Fuller's, or Thomas's; if he would make a vineyard, he must consult Fuller or Husmann; he can not know how to raise vegetables profitably, unless he is familiar with Henderson, Brill, and Quinn; and does he propose to raise florists' plants, or cut flowers, Henderson's Practical Floriculture, is of as much importance to him as a greenhouse. These are only some of the leading works; there are others, general and special, which with these, will be found in the book list in the back part of the paper. But books are of no use unless studied, and now is the time to study. Get the boys interested in them too. If you wish to graft, and do not know how, get Barry, or Thomas, and practice the various kinds of grafting, on fresh cut, useless limbs; let the boys try now, and then give them a chance in the spring. A few good books upon fruits, will do more than anything else to keep boys interested in the farm, and contented to stay there. Read, study, and when you find something not provided for in the books, we will try to help you, but we can not continually teach the simplest operations of horticulture.

Orchard and Nursery.

Trees, especially young ones, need looking after, to prevent injury by rabbits and mice. Fences and gates should be repaired and closed, to prevent cattle from entering and destroying the trees. When light snows fall, tread down around the trees to keep away mice. A mound of earth around the trees is useful for this purpose, as well as to keep newly set trees in place during high winds.

Rabbits are best kept from injuring trees, by sprinkling blood on the trunk. A wash of cow dung, sulphur, and loam, is reported as useful.

Pruning may be done during mild days, but for larger limbs it will be better to wait until towards spring. Cover large wounds with gum-shellac varnish, melted grafting wax, or paint.

Cions.—Cut when the trees are not frozen, tie in small bundles, and store in saw-dust in the cellar. Earth will keep them from drying equally well, but saw-dust leaves no grit to dull the knife.

Drains for surface water should be provided; a young orchard is often severely injured by lack of care in this matter.

Root-Grafting.—Stocks should have been taken up before freezing weather. If not done, make use of the first open spell. Store in earth in the cellar, where they will be accessible for grafting during the winter.

Seeds of stone fruits should be buried at once, if not already done. Place small quantities in boxes of earth and set where they will freeze.

Fruit Garden.

Raspberries.—If not already done, bend down and cover the canes of the tender varieties, if the ground is still open.

Grape-vines should have been pruned last month, but advantage may be taken of the mild weather of this. In Northern localities, young vines, even of hardy sorts, will fruit better if they are laid down and covered.

Strawberry Beds should be given their covering of leaves or straw, just before the ground freezes. Two or three inches is sufficient, as the object is to protect the plants from sudden changes of temperature, rather than to exclude frost.

Wood for rustic work, may be cut and prepared for use next season. With a little skill in arrangement, many ornamental articles may be made for the flower garden and lawn. Posts and stakes should also be prepared; locust, red cedar, and chestnut, are all good, the first two sorts remaining sound for many years. All wood for posts ought to be seasoned under cover if possible, and so piled up that there will be a free circulation of air around and through the pile.

Spade up all ground between rows of fruit trees, and apply well rotted manure.

Kitchen Garden.

But little can be done here, except to look after the frames and pits, and care for seeds, etc.

Cold-frames.—Do not cover until freezing weather comes, and even then air should be given during the middle of every mild day.

Roots.—If plenty of marsh hay or leaves are at hand, it is well to cover a quantity of parsnips and salsify, so that they can be dug from time to time as wanted; they are much better than poorly kept ones. To keep roots properly in the cellar, they should be stored in earth, and if the house cellar is used, secure ample ventilation.

Spinach.—It is better to cover with leaves all beds which are to be left for next spring's use, except where the winters are mild.

Lean-poles should be properly cared for under cover. When sheltered they will last for several seasons, and if of oak, walnut, or red cedar, they will easily last for a dozen years. Pea-brush usually has to be renewed every season.

Rubbish.—If there is no snow on the ground, all weeds, brush, and rubbish in general, may be cleared up and burned, and the ashes spread or saved until next spring.

Seeds.—Thrash out and clean all seeds that remain uncared for, and label with date and name of variety. Keep in a cool place where there is no danger from mice.

Trenches or pits, where roots are stored, will not need covering until freezing weather comes, and then only gradually, just enough to keep out frost.

Flower Garden and Lawn.

Climbers, not perfectly hardy, should be taken from the trellises and covered with leaves or earth.

Trellises which are movable, should be taken down and stored under cover, those which are permanent should have a good coat of paint as a preservative.

Pits where plants are stored for the winter, need ventilation, except during unusually severe freezing weather. Apply water only sparingly, and when absolutely needed.

Protection.—The same general directions apply to giving protection to half-hardy shrubs and trees, as were given for strawberries. Tender roses are protected by laying down and covering with sods.

Evergreens.—Young trees will sometimes die for want of a little protection, when older ones of the same varieties will stand even a much lower degree of temperature. A slight covering with evergreen boughs, will be of much service for this purpose.

Leaves.—Gather all the leaves that are found on the lawn, and store in a dry place for use as bedding or protection. If there are leaves near at hand in the woods, as many as possible ought to be gathered and stored for winter use; they rot readily, and make valuable manure. They will be needed in making hot-beds in early spring.

Greenhouse and Window Plants.

Ventilation is one of the most important things to look after at this season, as by a little injudicious opening of ventilators, many choice plants may be ruined. Always open on the side opposite to that from which the wind blows. When the weather is very cold and freezing, air enough will enter through the little cracks to afford the necessary ventilation.

Water.—Apply only when the soil is dry, and then give an abundance, otherwise the plants will soon perish. Shower the foliage once or twice a week, except during the coldest weather.

House Plants usually suffer from the dry dusty atmosphere of the rooms in which they are placed. If showered occasionally, and the thick-leaved kinds wiped off with a damp sponge, they will grow much better.

Wardian Cases, or ferneries, are now in general use among plant lovers, as they enable one to grow a few ferns and other plants very readily, and with but little attention, except to shade from the direct rays of the sun. But little water is needed after that given the plants when first set out; if any mold appears the case should be opened for an hour or two every day.

Bulbs that have made good roots, may now be brought up from the cellar, and in six weeks time will give an abundance of flowers.

Succulents.—Echervias and tender sempervivums, will winter in a cool part of the greenhouse, if kept dry. Water should only be given sparingly.

Cactuses coming into flower, will require plenty of water, and those at rest scarcely any.

Insects should be looked after closely; give the house a thorough smoking once or twice a week, to kill the green-fly, and other pests.

Commercial Matters—Market Prices.

The following condensed, comprehensive tables, carefully prepared specially for the American Agriculturist, from our daily record during the year, show at a glance the transactions for the month ending Nov. 13th, 1874, and for the corresponding month last year:

Table with 2 main sections: 'TRANSACTIONS AT THE NEW YORK MARKETS' and 'Comparison with same period at this time last year.' Columns include Receipts, Sales, and various commodity prices like Flour, Wheat, Corn, Rye, Barley, Oats.

Table titled 'Stock of grain in store at New York.' Columns: Wheat, Corn, Rye, Barley, Oats, Malt. Rows: Nov. 9, 1874; Nov. 10, 1873.

CURRENT WHOLESALE PRICES.

Table of current wholesale prices for various commodities. Columns: Oct. 13, Nov. 13. Rows include Flour, Wheat, Corn, Rye, Barley, Oats, and many other goods.

Gold has been up to 110 1/2, and down to 100 1/2, closing November 12th at 110 1/2, as against 110 1/2 on October 12th. The dealings in most kind of produce, have been on an enlarged scale, but values have shown much irregularity. Prices of Flour, Wheat, Corn, Rye, and Oats, have been quoted lower, on more urgent offerings of supplies, leading to a fairly active business.

a rule, and in instances stronger and buoyant. The trade call has been somewhat brisker, but considerable difficulty has been experienced in making purchases of any large amounts of stock, holders insisting on rates much above the views of buyers. The recent receipts of stock from all sources, have been very moderate, and present indications are not encouraging, as to the probability of additions to the supplies.

New York Live-Stock Markets.

Table of live-stock receipts and average prices. Columns: Week Ending, Receipts (Bees, Cows, Calves, Sheep, Swine), Average per Week.

Beef Cattle.—The market for beefs has been marked by considerable variation during the month, and on the whole has been the reverse of satisfactory to sellers. Opening with an active demand for good cattle, and a buoyant feeling generally, dealers were tempted to bring on very large supplies, which, in the second week of our report, broke the market entirely.

The prices for the past four weeks were as follows: Table with columns: Week Ending, Range, Large Sales, Average.

Milk Cows.—Cows have been steady, with fair demand and regular supply. Prices remain the same, at \$45 to \$80 for poor to choice cow and calf, and \$89 to \$103 for the best offered. Calves.—There has been a sharp business in good calves at full prices.

Recent Stock Sales.

For the past few weeks sales of Shorthorn and other stock have been very lively. Values do not seem to diminish, as the highest average yet made in England was reached at Mr. Cheney's sale. The first sale of importance in October was that at Holker, of the Duke of Devonshire's herd. Here from \$5,250 to \$5,775 was paid for Oxforde, and the average for 25 cows and heifers and 15 bulls was \$1,970 each, 43 head selling for \$84,690.

for \$10,000, an average of only \$175. The best bull, which is thought to be superior to any other bull of the breed now living, brought less than \$500; the cows sold for \$200 to \$300. A sale of 45 Jersey cattle, the property of Mr. Marjoribanks, of Bushey Grove Farm, brought from \$35 to \$355; only one cow reaching the latter figure. This herd sold badly, as it had been bred injudiciously, every other valuable feature having been sacrificed to color. Breeders may well be warned by this example.

The sale of the Waldberg herd of Shorthorns, of A. A. Conger, of Haverstraw, N. Y., at Chicago, resulted in an average of \$456, bulls selling from \$100 to \$900, and cows \$130 to \$1,800. Alexander Charles' sale of 71 animals brought an average of \$131. At several other sales in Illinois the average was from \$103 to \$231. At the sales of Kentucky Shorthorns, held through October, low prices were received for what is called unfashionable stock. At a joint sale of several breeders 35 animals brought only \$3,155, an average of \$90. E. G. Bedford's sale of 35 head brought \$58,530, the highest prices being \$6,000 for London Duchess 9th, and \$7,000 for 21st Duke of Airdrie. 119 head of Mr. B. B. Groom's sale brought an average of \$573, \$90 and \$2,550 being the extremes. Gag Bros. sold 57 head at an average of \$159. In all 690 animals were sold in October at 13 sales, and at prices which were remarkably reasonable, and which should be tempting to farmers who desire to improve their stock.

containing a great variety of Items, including many good Hints and Suggestions which we throw into smaller type and condensed form, for want of space elsewhere.

Remitting Money: - Checks on New York City Banks or Bankers are best for large sums; make payable to the order of Orange Judd Company. Post-Office Money Orders for \$50 or less, are cheap and safe also. When these are not obtainable, register letters, affixing stamps for postage and registry; put in the money and seal the letter in the presence of the postmaster, and take his receipt for it. Money sent in the above three methods is safe against loss.

N.B.—The New Postage Law.—On account of the new postal law, which requires pre-payment of postage by the publishers, after January 1st, 1875, each subscriber must remit, in addition to the regular rates, ten cents for prepayment of postage by the Publishers, at New York, for the year 1875. Every subscriber, whether coming singly, or in clubs at club rates, will be particular to send to this office postage as above, with his subscription. Subscribers in British America will continue to send postage as heretofore, for pre-payment here.

Bound Copies of Volume Thirty-two are now ready. Price, \$2, at our office; or \$2.50 each, if sent by mail. Any of the last seventeen volumes (16 to 32) will also be forwarded at same price. Sets of numbers sent to our office will be neatly bound in our regular style, at 75 cents per vol. (50 cents extra, if returned by mail.) Missing numbers supplied at 12 cents each.

Our Western Office.—Our friends in the West are reminded that we have an office at Lakeside Building, Chicago, Ill., in charge of Mr. W. H. Busbey. Subscriptions to *American Agriculturist* are taken there, and sample copies of the paper and chromo are delivered, and orders received for advertising on the same terms as in New York. All our books are on sale at the Western Office. Please call and examine, buy, subscribe, and advertise.

The American Agriculturist in German.—We ask the kind attention of our readers to the fact that this paper is also printed in German. Many of them may have friends, or neighbors, or working men of that nationality, who would be glad to secure such a Journal as this. The more important articles and the same illustrations are contained in the German edition, with a Special German Department by Hon. Frederick Münch, of Missouri, and the rates, single and club, are the same as for the English edition.

Save the Index Sheet, which is put loosely in this number, so that it can be bound or stitched at the beginning of the volume without cutting the thread.

See Page 469.

REMEMBER THAT NOW Your Subscription Has Expired,

(unless you have recently renewed it for 1875, or chance to be among the few whose time runs over into next year, of which fact you will be cognizant, without personal notice from the Publishers.)

PLEASE RENEW AT ONCE,

For the following Reasons:

1st.—If the subscriptions for 1875 are sent in the first week in December, it will greatly assist the Publishers in getting the names carefully and systematically upon the mail-books, so that the January number can be mailed promptly before the year closes—to the pleasure of all.

2d.—It will take no more time to attend to renewing to-day, than will be required next week or next month.

3d.—The motto of all connected with the *American Agriculturist* is "Excelsior," and the Volume for 1875 (XXXIV) will in many respects be superior to any previous volume—in engravings, in useful and interesting reading matter, etc.—for all classes.

4th.—In addition to the above "Reasons," we ask the following special favors:—Please invite your neighbors to join you in taking the paper. See advertisement "Subscribe Now" on third cover page. If you have German friends, or neighbors, or workmen, please let them know that the *American Agriculturist* is printed in German also, with the same illustrations, the more important reading matter, etc., besides a Special German Department by Hon. Frederick Münch, of Missouri, and that the German edition is furnished at the same rates, single and club, as the English edition.

5th.—TO-DAY is the best time to renew your subscription for 1875.

Reading the Advertisements Pays, whether one wants to buy anything or not. Every business man has his own way of setting forth his goods or wares, and studying these business announcements awakens new ideas in the mind of the reader. We have had some of our most valuable new business thoughts start up when running over advertisements on entirely different subjects. . . . There is one satisfaction in reading the advertisements in this journal, that is afforded in few other papers, viz., that the editors and publishers aim to shut out all unreliable and deceptive persons and things, so that one may read the business pages with confidence. . . . The advertising pages are in one sense a "Grand Bazaar," where sellers and customers may meet for mutual acquaintance, and consultation and discussion. We introduce the dealers to the readers, and whenever addressing these dealers, please let them know you formed their acquaintance in the *American Agriculturist's* Bazaar.

No Farewell Words.—Though this is the close of the year, we offer no farewell words, because we expect to meet all the members of our household at the beginning of the New Year. We try to consider every regular reader of this Journal as a member of our family, whose interests are to be jealously guarded and promoted in every possible way, and the multitude of kindly expressions of appreciation of this mutual relation, continually coming to us, are of inestimable value, and the greatest reward of our labors. We hope ever to merit this good will, and in the coming year we shall continue to spare no effort to increase the mutual respect and kindly feeling hitherto existing between the editors and readers of the *American Agriculturist*.

Clubs can at any time be increased by remitting for each addition the price paid by the original members; thus: a person having sent 10 subscribers in one club, for \$12, (\$13 including postage), may afterward send 10 more subscribers, with only \$8, (\$9 including postage), making a club of 20 at \$1 each, (that is, \$22, including postage). Postage, 10 cents each, must be sent additional to subscription price, with each subscriber.

This Month being the last in the year, is one in which we would be glad to clear off all accumulated correspondence, but we are unable to do this, as our basket is smaller in December, than in any other month. Pages for the index are taken from that part of the paper devoted to Basket Items. We must try some how to have a more capacious basket.

SUNDRY HUMBUGS.—In looking back upon the year, we cannot regard it as having been very prolific in the way of humbugs. But few startling new enterprises of this kind have been set on foot, and the old ones do not appear to have done a very flourishing trade. The "panic" of last fall, which had such a disastrous effect upon legitimate business, appears to have had its influence upon swindlers. The pretended dealers in counterfeit money have shown a remarkable falling off; in former years it was not rare for us to expose a dozen or twenty of these rascals every month, but now new names are very rare. The year has not been memorable by having any important law-suits brought against us, but the decision in the action brought against us by one David Richards, which was instituted earlier, but only closed in January last, is one of the greatest significance. Here we have, for the first time, from the highest judicial authority—the Supreme Court—an opinion which clearly shows the relation of journalists to the public, and gives emphatic support to those who, with honest intent, would shield their readers from the various schemes of quacks and swindlers of all kinds. While we do not court law-suits, as they take up too much valuable time, we are very glad to have been the means, through this one, of calling forth an opinion that will long stand as a terror to evil doers, and as an encouragement to those who expose them.

OUR COURSE NEXT YEAR will be the same that it has been in former years. Aided by a better knowledge of "ways that are dark" that experience brings, we shall unrelentingly pursue all open and covert attempts to defraud the people, all schemes for getting money without sending an equivalent; all lotteries by whatever name they may be called; all quacks who sell nostrums by acting upon the fears of the unfortunate, or hold out false hopes to the suffering—in short, all those persons and things which are collectively classed under the convenient name of "HUMBUG."

Perhaps there is no word in so general use, the origin of which is so little known. Several derivations have been given, but the most probable is that it is a modification of *Hamburgh*. During the Continental wars, so many false rumors came from that city, that when any startling intelligence arrived at London, the people said, "Oh! that's another *Hamburgh*"—and this, easily

changed to humbug, was used for impositions and frauds of all kinds. For many years the *Agriculturist* fought the army of humbugs alone and unaided, but it now and then receives a partial support from other papers, and a most excellent work was done when Congress made it a criminal act to send obscene literature and fraudulent schemes through the mail. Very active in this matter has been

THE SOCIETY FOR THE SUPPRESSION OF VICE.

Its agent and the special agent of the P. O. Department, a few weeks ago arrested a man for sending obscene matter through the mail; the prisoner tried to bribe Mr. Comstock to release him, and failing in this, he assaulted him with a knife, and inflicted wounds of such severity that for a while Mr. C.'s life was in great danger. The prisoner is now in jail, to be tried for a murderous assault, and as the matter occurred in New-Jersey, he is likely to get all the law allows, while on the other hand, the public have taken a new interest in the Society, and it will go on more vigorously than ever. These chaps fare quite as badly when they take the law into their own hands as when they appeal to the law in the regular way... It is especially necessary that an agricultural paper should

GIVE WARNING TO FARMERS

of swindling schemes, as their promoters well know that their chances are better among the honest and kind-hearted than they are with those who are known as "men of the world." A farmer living an isolated life, and receiving but few letters, naturally looks upon a circular, sent to him by mail, as a matter of no little importance. He is likely to feel flattered by the attention, and the very fact that some one in New-York, or other large city, should send to him, gives him a favorable impression.

In former issues we have told how these names are collected, and the following advertisement will show the manner in which they are offered to purchasers. We may remark that this appeared in what is called a "sporting" paper, the organ of prize-fighters, rat-killing matches, and similar "sports."

250,000 NEW, FIRST-CLASS ADDRESSES FOR SALE. Names of agents, canvassers, country people, and "good buyers" generally. Secured at great expense, and will be copied on sheets, wrappers, or envelopes, at a low figure. Warranted genuine, and none better. Address—Montgomery place, Boston, Mass.

The scheme by mail is no doubt plausible—they always are, and the man, innocent of all knowledge of the fact that hundreds of men get their living by cheating, is more likely than not—unless warned by some person or paper in whom he has confidence, to yield to the temptation thus presented. One of the exceeding pleasing things about our relations to our readers, is the friendly confidence with which they regard us. Almost every letter upon editorial matters, brings us some expression which indicates that it is not a mere business relation between us, but the writer speaks as one friend to another. Possessing this confidence, we have felt that our warnings and exposures of humbugs would be heeded, and we have the satisfaction of knowing both from personal intercourse and through correspondence, that we have saved

MILLIONS OF DOLLARS

to the agricultural community, and that the *Agriculturist*, had it done no other good, has in this been of real benefit to the farmer. Encouraged by this assurance from all parts of the country, we shall be after the whole swindling crew with a "sharper stick" than ever. We ask our friends to continue to send us information of all doubtful schemes, especially if they (as most of them do) hail from New York... It is hardly necessary to tell our old readers our opinion of lotteries. No matter with what sugar-coating covered, whether called "distribution," "gift-concert," or what not, each and all are to be avoided. If for an ostensibly good or charitable object, so much the worse for the object. No good thing can be really helped by a resort to gambling.

OPERA HOUSES

seem to be favorite prizes in these schemes. One is offered at Germantown, Pa., and it is said that the Grand Opera House, of Jim Fisk notoriety, is to be put up in a lottery. How the man is to be pitted who draws it. It has been an expensive failure from the first.

THE GENEVA WATCH CO.'S

circulars are still going around. In the first place, the name is a fraud, as there is no such watch company in Geneva, as is represented. We do not believe that a watch was ever "made by machinery" in Geneva, and that the watch is "endorsed by all the leading jewelers," is a barefaced lie. We have had so many complaints of this Geneva watch business, the parties receiving the money, and sending notice that the order will be filled in turn, that we advise all to let the concern alone.

A SWINDLER IN NEW HAMPSHIRE

one would think would be as rare as a white black-bird, but even in the Granite State the proverbial Yankee

"cuteness" does not save them. A venerable gentleman, with spectacles and cane, appeared at Great Falls. He wished to open some manufacturing establishment, and wished a partner with \$125 to engage with him. Venerable man got \$125, and left young partner with rent of building and other bills to pay. Now we don't say, it served young man right, but we do say that he paid \$125 for a lesson that he will not forget so long as he lives. Leaving the money out of the question, how can a sensible person associate himself in business with an entire stranger!... Complaints continue to come about that

TOLL-GATE FRAUD.

A chap advertises "The Toll-Gate, a prize picture, sent free." It is a card about 3x5 inches, with on one side a most doleful attempt at a puzzle picture, and on the other an advertisement of a book on physiology of doubtful propriety, to judge from the card. We have exposed this thing before, but complaints keep coming. Why not write to the Harpers, and other very good people, who publish the deceptive advertisement... In the medical line there are no more insidious things than

BITTERS.

We have often warned our readers that they were dangerous, as for the most part their activity depended upon alcohol in some form—usually poor whiskey, and that people were by their use led into dram drinking unknowingly. They are mainly poor liquor, with some cheap bitter and aromatic drugs, sweetened and colored, and put up with showy labels. If persons are to take liquor medicinally, they should know exactly what they are doing, and not have it smuggled into them under false pretenses. In Rhode Island there is a very stringent prohibitory law, and while liquor selling diminished, the sale of bitters went on increasingly. The sheriff had 35 of the popular kinds examined by a chemist, and found that the majority contained more alcohol than wine, and some, showing over 40 per cent of alcohol, were quite as strong as ordinary brandy or whiskey; even one that is widely advertised as "Vinegar Bitters," contained 7½ per cent of alcohol. There can be but little doubt that in the great majority of cases, these "Bitters" are taken solely for their alcohol, as we find those that are most popular in the market, are those in which the percentage is the highest. If one needs only the tonic effect of the bitters, they can be had just as well in a watery infusion. Our often repeated advice is to let all quack medicines alone, and in this category we include bitters.

An Invaluable Help in every Home is a large Dictionary—not merely a "pronouncer" and brief "definer," but one explaining fully the meaning of all words, whether ordinary or rare. Such a Dictionary, like Worcester's Great Unabridged, containing **1,854** large 3-column pages, with an immense number of engravings, is a most valuable source of condensed information on almost all topics, and will do very much to make all the members of a family intelligent. It is well worth a place in every house, and should be in every school-room without fail.—Many families have obtained free copies through our premium offer in years past, and hundreds, or thousands even, may do so this year. **BOYS** have been particularly successful in this way, and almost any enterprising youth can, by persistent effort, scarcely fail to collect the eighteen subscribers needed to get this prize free. The work of doing this will give him useful business experience. See page 469.

Barn Plan.—"Daniel Trimble." The particulars of the barn plan described in the *Agriculturist*, in December, 1872, can be given, if we are informed what is wanted. But they can not be sent by mail unless the address, which was omitted in your letter, is given.

Apple Pomace.—"W. F.," Luzerne Co., Pa. Apple pomace may be given to a cow in small quantities as a relish only. It is not suitable for feed, and should not be given in large quantities. It will help to increase the flow of milk only by stimulating the appetite, and causing a larger amount of other food to be digested and assimilated as nutriment.

Farming in North Carolina.—"J. W. B.," Statesville, N. C., sends an account of how he farms in North Carolina. He removed from the State of New York 4 years ago. He plows under a crop of cow peas, upon "old field" land in the fall, and with a light top dressing of stable manure in the winter, has produced 34 bushels of wheat per acre, while by April 1st, the next year, the clover was 12 to 18 inches high. The land is excellent for orcharding. Land sells for two to ten dollars per acre. There are no bridges in the country, the roads are good, and not one-third of the land is cultivated.

See Page 469.

GOOD THINGS VERY CHEAP.—We again remind our friends, (and by friends we mean all our Readers,) that there are in our Premium-List (referred to on page 469) many good things, things really useful and desirable, which they can all get at very little expense, if any. We have large plans for making this journal very good and very valuable to everybody during the coming year, and we shall surely put many items of information into the *Agriculturist*, that will each be worth far more than the small subscription price. Now it will not be much labor to talk this to others, and get a few at least to subscribe. For every list of names sent us, large or small, we offer good premium articles of various kinds. The Publishers having extraordinary opportunities to get these premium articles, can afford to give them as they propose, and take pleasure in seeing them distributed. Our friends know that we never mean to send out any articles but those that are good and every way reliable, and as represented. Please look over the list of Premiums, and each one favor himself, and us, by securing one or more of them.

Home-made Fertilizers.—"W. J. B.," Macon, N. C. There is no home-made fertilizer that can be profitably substituted for Peruvian Guano. The market value of guano is fixed according to the quantity of its chemical constituents which are available for manure. Any chemical substance, as salts, acids, or alkalies, valuable for fertilizers, have their value fixed upon the same basis. Nitrogen, phosphoric acid, or potash, has each its standard value, in whatever article or shape it may appear.

Clubs of Subscribers need not all be at one Post-Office. The reduction in price to clubs of four or more names, is partly made to encourage the getting up of large lists, and partly because it costs less to mail a large number in one package. But we do not object to names added from other Post-Offices, as such names usually soon become centers of other clubs. Names for Premium Lists may also be gathered at any number of Post-Offices, if all are sent by the same person.

Sowing Down New Land for Pasture.—"Granger," York, Pa. New land just cleared, may be sown down to grass without the intervention of any crops. Probably in this case it might do very well to seed down with a crop of oats thinly sown, not more than two bushels per acre, in the spring. For permanent pasture in your locality, we would use 8 quarts of timothy, one bushel and a half of orchard grass, and one bushel and a half of Kentucky blue grass per acre. The blue grass will not show much until the third year, after which it will form a considerable portion of the pasture, filling up the spaces left by the gradual disappearance of the orchard grass, and furnishing good late pasture.

A Rolling Horse.—"A. L. W.," Kittery, Me. If practicable provide a loose stall, that is, an enclosed roomy stall not less than 12 feet square, for a horse that has a habit of rolling, and use no halter, but leave him unfastened. Possibly the rolling is caused by irritation of the skin, in which case give an ounce of sulphur in the feed daily for a week, and feed bran in place of part of the corn. At the same time good currying and brushing would be a help. If a box stall is not convenient, as it frequently is not, tie the horse with a strong halter so short that he can barely lie down comfortably. A friend has a horse that persists in getting "cast" in any stall, which is prevented by the short tying.

Good Books Pay.—It will pay to supply yourself, your sons, your workmen, your whole family, with good books as well as papers. Your sons and your workmen will be kept from idleness and mischievous company; they will understand and respect their work more; they will gain new ideas, and learn to reason and think better; they will learn to make their heads help their hands; they will labor more intelligently, and be happier. See to it that interesting and instructive works are always at hand in your home. Look over the List of Books published every month in this Journal. It will pay to provide yourself, and each member of your family, if you have any, with good books, even if economy has to be practised in other directions, to enable you to do this.

Hurdles for Sheep.—"T. G.," Kittrel, N. C. Iron hurdles for folding sheep, may be procured of Yarnall & Trimble, 147 Front St., Philadelphia. These are very much more durable than wooden hurdles or netting, and can be as readily set up. Five-barred hurdles of this kind, would also be perfectly secure against cattle or horses, and would serve as good a purpose as any of the portable fences.

Rust on Wheat or Oats.—"T. S. C." There is no known remedy against rust, when it has once attacked a crop of wheat or oats. The only probable preventive is to sow a variety that is hardy and sufficiently vigorous to resist the attack of the rust fungus. There are "rust proof" oats, commonly sown in the Southern States, where this crop is subject to attack; and the hardier red and amber wheats do not suffer so frequently as the white varieties. The use of lime or salt as fertilizers, tends to prevent rust; but excessive heat, and a moist atmosphere just at the season when the grain is filling, appears to be a frequent cause against which no preventive or remedy is known.

Don't fail to Read what is said about Light Work and Good Pay for December, on page 469.

To Make Timber Durable.—"W. V. S.," Lebanon, Tenn. The durability of timber is much increased, by soaking it in strong limewater for a few weeks, and then exposing it to the air under cover, to be seasoned. Fence posts should be stripped of their bark before steeping them.

Lice on Poultry.—"T. S. C." There is nothing in the feed either to cause or to prevent lice on fowls. Lice will only breed where fowls are not kept clean, or where they are neglected. A very effective remedy is to clean the houses thoroughly, and to apply lard or linsed oil to the perches, and beneath the wings of the fowls.

The Fair in Indian Territory.—The first fair of the Territorial Agricultural Association was held at Muskogee, the last week in October. It was a combined effort on the part of the civilized tribes, and brought out a fine show of horses, hogs, and poultry, with a limited display of farm utensils of native manufacture. The attendance was very good, and addresses were made by prominent Indians, as well as by persons from other States. As there is included within the Territory a large extent of the finest farming lands in the West, this fair cannot fail to exercise a good influence in having these lands improved. We congratulate the managers on the success of this, their first exhibition.

Sowing Grass Seed.—"T. S. C." Grass seed may be sown at any time during winter, upon the snow or frozen ground, if that is more convenient than sowing it upon the soil in spring. The seed lies uninjured until spring, and falling into the minute cracks made by the frost in the ground, it becomes well covered when the soil thaws.

A Faded Carpet.—"A Young Housekeeper," Chicago, Ill. experimented in cleaning her carpet with damp salt. The carpet is ingrain, drab and green, and the salt was dampened and sprinkled over it, as sawdust is used in sweeping carpets. At first glance the carpet was, in appearance, clean, fresh, and new, but as the dampness left it, the bright green changed to a dull dark shade, and no amount of sweeping could change it. The present color is not pleasing, and she asks what she can do.—Whether anything can be done to restore the color, will depend upon the character of the original dye. She had better consult some competent dyer.

Time to Kill Bushes.—"T. S. C." The best time to cut brush, is when in full leaf. At that time the shock is often sufficient to kill the plants. If cut now, the roots will sprout in the spring, and become even more trouble to destroy than before cutting.

A Venerable Horticulturist Gone.—The Gardener's Chronicle, of Oct. 3d, contains an interesting obituary of one of the best of the nurserymen of the old school, in England, (the father of the editor, although that is not alluded to), viz: the venerable William Masters, of Canterbury. He had reached the age of 78 years, and as the nursery and garden was that of his father before him, he must have been one of the very oldest of English nurserymen, as he certainly was one of the most scientific. He was an accomplished landscape gardener in earlier days, and an ardent lover of the natural history sciences and geology, at a time when they were not so popular as they are now; he exerted himself vigorously to form a museum in his native city, and for

years acted as its curator, delivering lectures on botany and geology, and making his nursery a supplementary feature, by arranging it in part as a botanic garden. In former years he was a frequent and valued contributor to the natural history and horticultural magazines and transactions, was an esteemed citizen and magistrate, and had been the mayor of his native city. The writer of this notice retains a delightful memory of the great and unaffected intelligence, active kindness, and urbanity of the excellent old man who has now gone to his rest at a good old age. A. G.

In addition to the above appreciative note by Prof. Gray, we may say that at the time of his death, Mr. Masters was the oldest member of the Royal Horticultural Society.

Time to Cut Timber.—"T. S. C." Timber, when its durability is the chief consideration, is generally cut in midsummer or in midwinter; cut then the seasoning process in more rapid and perfect.

The Mass. Horticultural Society has recently elected Mr. Francis Parkman, Jr., as its President. Mr. Parkman is a worthy successor in the line of distinguished horticulturists who have held this office, and it is one of those rare cases in which the giver and recipient are both honored. Mr. Parkman has made for himself so honorable a name in literature, that we are accustomed to look upon him as the brilliant author, rather than as a quiet practical horticulturist, who finds relaxation from the labors of the study in those of the garden. This election is a proper tribute to the worth of one of the most modest of the many cultivators who have made Boston the horticultural center that it is.

Government Lands in Iowa.—"J. W. C.," Jersey City, N. J. The few lands belonging to the U. S. Government left in Iowa, are located in the north-western portion, and are situated far from railroads and towns. These are not by any means the cheapest lands for a settler, even when he gets them for nothing. The time lost in going back and forth to a depot, or town, 10 miles distant, every year, will easily pay the interest upon the cost of a farm at \$10 per acre; and the choice lands near towns can be bought from railroad companies for that price, on long time. The Burlington and Missouri Railroad Co. have some choice land in Iowa.

The Christian Advocate, also offers a premium of "Merely Knocking at the Wicket Gate." It has been highly commended as a work of art. A subscription to the Christian Advocate will be a cheap mode of securing a beautiful picture.

Poultry for the N. Y. Market.—Unless those who send poultry to the New York market, comply with its customs, they had better send it elsewhere. In former years we have given full directions for preparing poultry, and now remind readers of the essential points, by publishing the following condensed directions, which come to us in a timely circular, from the old poultry house of E. & O. Ward, 279 Washington street. "To insure highest market prices, poultry must be well fattened; crops empty when killed; kill by bleeding, but do not remove the head. Have them nicely and well picked; skin not broken or torn; entrails should not be removed; thoroughly cooled, but not frozen. Pack in boxes, with a layer of clean straw (rye straw the best) between the layers of Poultry, in the same posture in which they roost. Mark each box, specifying what it contains. Send invoice by mail. Ship to reach us about the middle of the week—should never reach us so late in the week as Saturday.... Greatest demand on special occasions. Fine fat turkeys for Thanksgiving. Prime and nice geese for Christmas. Extra large and nice turkeys for New Year's day. On all these occasions shipments should reach dealers two to five days in advance.... If you cannot find any profit in sending prime quality and well prepared, you need not look for any in ordinary or poor qualities."

The Use of Paris Green.—At the meeting of the Academy of Science, held early in November, Dr. John J. Le Conte read a paper upon the use of Paris Green for killing injurious insects, especially the Colorado potato-beetle, and presented the subject in a manner calculated to create alarm. Dr. Le Conte is a high authority in his specialty, entomology, and admits that the chemical aspect of the subject must be developed by his colleagues. The paper itself, and the discussion which followed it, show that really learned men, such as compose the Academy, do not know everything. This, which may be considered our highest scientific body, is gravely told—what every farmer who reads the papers knows—that Paris Green is sold by the ton. One member had heard of the loss of human life from its use to kill cockroaches, another announced the fact, which has

been in all the papers for these many years, that poisoning had resulted from using wall paper colored with Paris Green. The use of strychnine to kill crows, was thought wrong by another member, and the whole discussion was more befitting the N. Y. Farmer's Club, than the Academy of Science. Not one of the learned gentlemen present, seemed to know of the experiments of Prof. Kedzie, of the Michigan-Agricultural College, and none of the eminent chemists of the Academy explained what changes the poison underwent in the soil, but after wasting time in censuring the Agricultural Bureau at Washington—by which we suppose the Department of Agriculture was intended, and that is past all censure—the Academy adopted a resolution, appointing a committee to investigate and report upon the use of this and other poisons to kill insects and other animals, for the ornamentation of articles of food, coloring of paper, etc. We shall gladly welcome any addition to our knowledge in this direction, but as this matter of use of poisonous colors in confectionery and on wall paper, has been done over and over again, it seems very funny to see our savans taking it up as something new.

The Nevada Fair.—The first exhibition of the Nevada State Agricultural and Mechanical Society, held at Reno, during the third week in October, was entirely successful. There was a show of good stock, and the exhibition of fruit, grain, and vegetables, shows that the new State so celebrated for mineral wealth, can take fair rank as an agricultural State.

Filing the Agriculturist.—"D. E. C.," Traverse City, Mich. On reference to almost any volume of the *Agriculturist*, the estimate for the cubic measure of the ton of hay might be found. For timothy well pressed down, 500 cubic feet is allowed, and when not solidly packed, 600 feet is generally taken. A large number of requests come to us for information or advice, which could be easily procured by consulting the index of any volume of the *Agriculturist*.

Sick Fowls.—"H. P.," Clinton Co., Iowa. When fowls appear out of order and lose appetite, a change of food is often sufficient to restore them. The food should be mixed with a little linseed meal, and a small quantity of pepper and a small piece of coppers dissolved in their drinking-water would be useful. Fowls suffer more from want of clean water, and from badly ventilated and unclean roosting places, than from any other cause.

The Methodist and its Premiums.—The Methodist offers as premiums for new subscribers, the portraits of the late Dr. T. M. Eddy and the Rev. Alfred Cookman. An interest in these notable ministers is felt not only by Methodists, but by persons of other denominations, who were permitted to listen to their eloquence, and mark their pure and noble characters. The portraits themselves are fine specimens of the engraver's art, and can not fail to be acceptable and popular.

Don't fail to Read what is said about Light Work and Good Pay for December, on page 469.

Small Steam Engines.—"V. A. W.," Forsythe Co., N. C. The most compact, best finished, and safest engine we know, is the Baxter Engine, made by the Colt's Arms Co., Hartford, Ct. A cheaper engine, made by Whitman & Barrell, of Little Falls, N. Y., was described and illustrated in the *Agriculturist* of June, page 212, 1874.

Many for One.—Mr. W. R. Pease, showed us five ears of pop-corn from one stalk, which in the whole contained 3,454 grains. A goodly number to be produced from a single seed.

Information as to Jersey Cattle.—"I. M.," West Farmington. It is very strange that you have not found information as to the Jersey cows in the *Agriculturist* any time these few years past. Very many numbers will tell you that they are most valuable for a butter dairy. They are not the cows for cheese making. For that purpose the Ayrshire are preferable, or else the Dutch cattle.

Plant Named.—"C. P." The plant found in your cranberry plantation, is *Lycopus Virginicus*, the Bugle-weed. Quite common.

Premature Blooming.—Maj. John W. Beeks, Galena, Kas., sends specimens of cherry blossoms which were picked in the middle of October. He states that the warm weather and the showers, make the season like the month of June, and that many fruit-trees are in flower. This is bad for next year's crop.

The Hog Crop.—A report from 214 points in the chief pork producing States, states that in 159 places hogs are fewer than last year, in 27 places about the same as last year, and in 28 places more than last year. Of corn the same report states, that in 100 places there is less, in 79 more, and in 35 about the same as last year. The quality of hogs is reported as uneven.

Crop Prospects.—As regards the prospects of the newly sown wheat crop, both here and in Europe, there has rarely ever been a better promise. The weather has been remarkably favorable for seeding and the growth of the plant. So favorable has the season been at the East, that so late as on the 5th of November, more than one farmer of our acquaintance has sown wheat. From all parts of Europe a similar condition of the weather is reported. Of course this has a depressing influence upon the market, the extent of which it is impossible to forecast. One thing at least is certain, that the favorable condition in which the fall wheat crop meets the winter season, can only tend to affect the market unfavorably for sellers.

The Exhibition at New South Wales.—The Journal of the Agricultural Society of New South Wales contains the programme for the Metropolitan Inter-colonial Exhibition, to open at Sydney, April 6, 1875, in which a very full list of prizes is offered in both the agricultural and non-agricultural divisions. At the request of the Secretary, we cheerfully call the attention of our inventors and manufacturers of farm implements and machinery to the liberal prizes that are offered, and to the fact that competition is open to exhibitors from abroad. The Secretary thinks that a large market would be found for our machines, were they only known in the colonies, and states that all articles may be sold after the exhibition. By way of San Francisco, Australia is now much nearer to us than to the mother country: our letters now come to hand in forty days from their date, and as their agriculture is more like ours than that of England, the colonists find our implements and our papers better suited to their needs, than those of that country. We notice by the journal of the Society that steps have been taken to insure a representation of the Australian colonies at Philadelphia, in 1876. The Secretary of the Society is Mr. Jules Joubert, Sydney, N. S. Wales.

Poultry and Market Gardening.—“S. W. L.” Although you send stamp for a reply by mail, we cannot answer by letter, as we do not know where you live. You omit to state your residence, and the post-mark has not a distinguishable letter. Poultry cannot be successfully kept upon a large scale, unless the fowls have a wide range. There can be nothing more destructive in a market or any other garden, than a flock of fowls—even a small one. Unless the birds can be kept out of the garden, one or the other must be given up. Market-gardeners near New-York have all they can do to attend to gardening only, and then work more hours in the day than do most other people. We never give advice upon buying land, or the price to pay for it.

See Page 469.

Bees Notes.

BY M. QUINBY.

A friend in New Orleans, says: “Will you be so kind as to give through the *American Agriculturist*, your way of putting glass boxes on the side of combs.” Of course the most convenient way to do this, is with movable combs. The comb well fastened in frames, should stand on the bottom board, independent of the outside, as described in the *Agriculturist* for June, 1873. Have the sides of the hive out of the way, until the boxes are placed. My Cherry Valley friend has furnished for market over 40,000 lbs. of honey the present season, most of it in glass boxes, that hold a little over 4 lbs. The depth of the boxes is about 5 inches, length 6, width, 4 inches. Top and bottom are of wood, the sides of glass. The glass in the end that comes next the comb, reaches only about two-thirds of the way across the end of the box, leaving three-fourths of an inch on each side for the bees to enter. Imagine a comb standing upright of itself, all you have to do, is to set the box by its side, with the narrow glass towards it, so that the bees can enter. If the frames are 16 inches long, four boxes 4 inches wide, will just fill it out, and if 10 inches deep, two courses high will be just even with the top, eight more can be set on the other side, and eight on the top of the frame. These top boxes have holes through the bottom for the bees to enter. All of them may have inch holes without detriment, and then the boxes may be changed from side to top as required. Just these sizes

of box and frame, are not used in all cases, but the principle can not probably be bettered. Have the size of frames and boxes to correspond, and all alike for every hive in the yard, so that any box will fit any hive, and any frame of comb will fit any place. There is time now to think what hive is best to start with in the spring. Study the principle, and get ready now, or at least before spring.

At the discussion at the N. Y. Central Fair, at Utica, it was stated that some bee-keepers had furnished honey for market by the car load, the question was asked, how was it obtained? The answer was by cultivating bees. Then came the question, “What is meant by cultivating bees?” A partial explanation gave rise to questions innumerable, as “what is an improved hive?” “Why do you get more honey than we used to?” “What do you mean by raising queens?” “What by movable combs, and what is gained by them?” “What about Italians, are they better?” “How do you tell one kind of egg from another?” “How do you tell when they are going to swarm?” “How do you make artificial swarms, are they as good?” “How do you extract, when was it found out, how long have you done it?” Of course these questions, and others growing out of them, could not all be answered for want of time. How to prevent getting stung, seemed to be the main one. The fear of stings seemed to operate more than all else against beginning to keep bees. After it was explained that we work by quietly using smoke, and avoiding harshness, and that we need not get stung; it was announced that Mr. Quinby had a hive of *live* bees on the fair ground, and would illustrate the manner of handling at such an hour the next day. He attended, and went through with many manipulations, such as taking out the combs—without protection for face or hands. He exhibited every bee, and sealed and unsealed honey; he then found the queen—which a great many had never seen before, never daring to look so close to so many bees. The quantity of honey necessary for winter, was pointed out, etc. The combs were returned to the hive, and not a bee was made angry, nor was any one stung. No smoke was applied further than to show how easily it could be used in case they had been angered by an unlucky jar, or a bee pinched a little. It was claimed that any one, that could operate carefully, and especially without fear, would be equally successful. But few besides those having some experience with bees ventured to attend. On this point we need different training. We must disabuse the growing mind of this awful fear. It is the duty of the agricultural press generally, and of farmers who wish to save half of the immense honey waste of the country, to do something. Change the teaching. If a boy can be taught to risk his life at the cannon's mouth, to accomplish and bring about a wished for event, it ought to be easy to learn him to brave a bee sting, for the accomplishment of a great work.

Ogden Farm Papers.—No. 58.

As before intimated, I visited the St. Louis Fair, and, incidentally, saw a good deal of Western agriculture. The fair is entitled to all the encomiums it has received on the score of “bigness.” The extent of the exhibition, and of the crowd gathered together, is quite as great as has been claimed for it. The quality of the exhibition, too, is of great interest, though in most departments there was a lack of orderly arrangement, and an absence of systematic labeling, which detracted very much from its value to one who for the short time allowed desired to examine it carefully, and compare different articles of the same class with each other. The cattle of the different breeds were not separated, and in looking over the Jerseys, for instance, one had to skip about among stalls occupied by animals of half-a-dozen breeds. The implements and machinery were placed very much at random, and it was sometimes difficult to learn anything about particular entries, and always troublesome to compare them with their competitors. The \$11,000 offered as premiums for cotton attracted a wonderfully fine show from all the cotton-growing States at the Southwest.

I have been told that the St. Louis Fair was mainly a horse fair, and that its agricultural features were comparatively insignificant. This I did not find the case. There was a great deal

of trotting and running, and an interested throng looking on, but there was only a half-mile track; there were no very noted horses, and this feature of the exhibition seemed rather a subordinate one. In position and prominence it was much less conspicuous than the show of implements and machinery in motion, and on the whole the exhibition was not at all open to the criticism of being a “horse-trot” under the name of an “agricultural fair.” Indeed, it is not especially an agricultural, but rather a general industrial exhibition, the agricultural features of which are prominent. It serves its industrial purposes remarkably well; but as a fair, as a means for attracting an immense congregation of holiday visitors, I have never seen its equal. On the principal day there were over 100,000 visitors to the grounds, and a more orderly, happy, interested, and cheerful gathering one could hardly hope to find.

Aside from the horned cattle, the feature which most interested me was the good display of windmills. Many of these were excellent, and some of my old friends among them seemed to hold the prominent position they deserved, but I was especially taken with a new-comer, the “Enterprise,” which, for simplicity, efficiency, and I should say for durability, seemed to have advantages over all I had yet seen. It has the merit of being cheaper in first cost than any other of like character, and I shall pursue my investigation with a practical trial of its ability to turn our seaside winds to profitable account, and to withstand their tempestuous attacks.

AN ILLINOIS BUTTER DAIRY.

One leading object that led me to the West was the butter dairy of I. Boies & Son, Maren-go, Ill., concerning which I have several times written in these papers. My visit here was entirely satisfactory. The dairy-building described in a previous number has not yet been constructed, but in all other respects I found the accounts to be not at all overdrawn. There are now on hand about 100 milking cows, 60 of these had come in since August, and the others were expected to calve shortly. The cows are natives—or rather, they are such cattle of mixed races as are kept throughout northwestern Illinois, where dairying is the prominent industry over a very wide area. I can best describe their quality by saying that I have never seen twenty natives together that would average nearly so good as the whole hundred in this herd, which has been built up by a system of careful selection. Mr. Boies says he generally finds that he can buy a dairyman's best cow for five dollars more than the market value, and it is his practice to drive frequently about the country buying all the remarkably good cows he can find, and selling the poorest ones of his own herd. He has had the skill to carry on this system until he must have collected on his place most of the best cows within his reach.

The amount of butter made, per cow, has thus far been only estimated, but careful accounts are now being kept, and will be carried on throughout the year, so that we shall know pretty nearly what the possibilities of such a herd are. The method of feeding has been sufficiently described in my previous articles; the principle on which it is based is, that a milking cow should eat all that she can possibly be induced to eat. Mr. Boies is very strongly of the opinion that it is impossible to get the fullest profit from a butter dairy, or from any other, without having the cows come in in the

autumn. He then carries them through the hight of milking on high winter feed, and finds that when they are five or six months gone, and would naturally begin to fall off in their yield, the flush of the May and June pastures gives a fillip to their production, and carries them up pretty nearly to their full yield again,—by the time the summer drouth pinches the pasture, they are ready to be dried off for their next calving. This, in connection with the fact that the winter market is best for butter, makes his course seem judicious, and worthy the attention of others. Cows coming in in the spring give more during May and June than autumn calvers do at any time, but when they begin to feel the effect of their next pregnancy, there is only winter feed to be given them, and this does not sustain their productiveness as grass would do.

A very large item on this farm is the feeding of pork. Shoats are bought in fair store-hog flesh, are very highly fed on skimmed milk and corn, and are drafted for the market when in good selling condition. There is generally a profit of about one cent per pound on the original purchase, and the average increase of weight is 20 pounds.

The following experiment shows the profit of the operation, and indicates the care with which business details are attended to on this farm: June 12th, 10 average hogs were bought, weighing 1,850 lbs. They cost \$87.87½ (\$4.75 per hundred pounds). Corn cost 56 cents per bushel; skimmed milk, 20 cents per hundred lbs.; meal and bran, 1 cent per lb. August 3d, after 52 days feeding (the cost of feed being \$41.81), they had gained 975 lbs.—the increase costing \$4.29 per hundred lbs. They were then sold at 6 cents per lb., making a profit of \$39.82, to say nothing of the manure. They feed every year about 1,500 hogs, to which they add about 90 tons weight of pork.

I was enabled to see the whole operation of skimming, churning, working, salting, re-working, and packing the butter, the whole being done in a most systematic and business-like way, and the product being of first-rate quality for a dairy of common cows. The butter is of capital flavor and of good color. It lacks the firm texture of Jersey butter, and they are now considering the question of buying a Jersey bull, and raising the heifer calves from the best twenty of their own cows. If this course is carried on for a few years, there will be at Marengo a butter dairy herd that will be hard to equal.

The following account, received from Mr. R. Q. Tenney, of Colorado, is gratifying as confirming a theory which I have proved in practice to be a sound one, and have earnestly recommended:

"I wish to thank you for your article published in the winter of 1871, on transplanting mangels and sugar beets. I have probably saved to myself from \$150 to \$200 in the past three seasons, by following your directions. The first two seasons one of my neighbors, an old Iowa farmer, ridiculed the idea, but he was compelled to "acknowledge the corn" when he saw the result. This year a late frost killed, say three-fourths of the plants in my seed bed, and being so far from a base of supplies, had not time to send for more.

"Another time I will not be in so great a hurry to plant, as I find that they do not require a very long season.

"I transplanted from the 15th to the 22nd of July, and have fine beets, although the grasshoppers hurt them some.

"We are getting a good number of Jersey cattle into the Territory. I think I imported the first, and now have a fine bull, three years old Feb. 11th last."

FINE HERDS AT THE WEST.

While at the West I visited some of the principal Jersey herds in my line of travel, and, indeed, extended my journeying for the purpose. I was less gratified by the condition of my own animals in Illinois, than I hoped to be. The protracted early drouth drying up the pastures, and reducing all farming in southern Illinois to a very difficult pass, had the effect of pulling down their condition until I regretted having exhibited them at St. Louis. Their plight at least had the advantage of proving that with Jersey cattle, as with all others, good keep is necessary to good condition and good yield. Realizing the state of affairs, I turned on more steam, and had the satisfaction of seeing them at once improve, and I hear that they are now in much better order than at any time since June.

At the large and splendid blue-grass farm of Major Campbell Brown, at Spring Hill, Tenn., where a wide range had made up for the effect of the drouth, the Jerseys, (of which he has a very fine herd), were in excellent condition, and were yielding largely. Mr. Hardin, of Louisville, who has very little land, and depends mainly on purchased food, has his animals in fine order. Several breeders in the immediate neighborhood, have capital herds, and it is evident that here, as well as about Cincinnati, the Jersey is as great a favorite, and is as abundantly distributed about summer residences, as even about Boston or Philadelphia. The best cow I saw during my travels, is "Dinah," owned by John L. Stettinius, of Cincinnati, whose whole herd is quite worthy to be in the same pasture with her.

I advise all Eastern farmers who desire to remain content with what they have at home, and to bear with equanimity the six months of winter feeding that our climate makes necessary, to keep away from Mr. Alexander's 3,000-acre farm, of Woodburn, in the blue-grass region near Lexington, Ky., where animals can graze during nearly the whole winter; where the pastures are greener and more beautifully wooded, than any which we know; where the rarest animals, representing hundreds of thousands of dollars, are kept under circumstances of ideal perfection; and where our most enthusiastic dreams of pastoral life and profitable farming, are blended in a tantalizing reality. Whoever visits Woodburn, buys a few hours of delight at the expense of months of unsatisfied longing—tempered, however, with the influence of an example that is full of suggestive details, which cannot fail to have an effect on his future plans and aspirations.

I receive from all parts of the country, reports of success with Jersey cattle. Mr. F. M. Churchman, of Indianapolis, writes, that he has a heifer, only two years old last spring, which made in the flush of her milking, 12 lbs. 3 oz. of butter per week, and now, seven months after calving, is making over 7 lbs. per week. She is probably one of a small herd, and well kept, but this report is only a specimen of those frequently sent me, and they indicate that success with Jerseys, is by no means confined to the older breeders of the Eastern States; they seem perfectly adapted

to all parts of the country, and they are doing everywhere, all that could be desired to sustain the commendations which have been bestowed upon them by their admirers.

Of home news we have little worth reporting. The season has been exceptionally cool and moist, and we have had much dark weather. The grass crop was large, but the grass has been less nutritious than in warmer and brighter seasons. The cattle have shown the effect of this in their production of butter, although in as good condition as usual. We have more hay than ever, and for the first time I think, although our herd is large, we shall be able to go through the winter without buying. Our butter throughout the season, has been, if possible, better than ever before, and the quantity and flavor hold out remarkably well, as we have at this writing (Nov. 2nd) had no frost, and the grass is very fine.

It will be impossible this year to report the amount of our production per cow, with any approach to accuracy, for the reason that the sale of skimmed milk has become a very important item of our business, and we have frequently skimmed after twelve hours' standing, in order to supply the demand; being sure of a profit on our purchased milk, even if only partly skimmed, we have made more or less butter, according to the requirements of our market for butter or milk, and the butter product per cow for the year, would probably make a less favorable showing than in the report for 1873. We have recently sold five of our most important cows, and, pending the selection of good Herd Book successors to take their places, we shall buy fresh native cows, and force them to the greatest possible extent with corn meal, getting all the butter from them we can, and turning them off fat in the spring for the butcher.

Heavy Shorthorn Grade Cattle.

In the *Agriculturist* for March 1870, there were published portraits of four heavy fat steers, raised by Mr. George Ayrault, of Poughkeepsie, N. Y. On the first page of the present number will be found portraits from life, of two heifers and two steers, which are even more remarkable than those of 1870. These are also raised and owned by Mr. Ayrault. The two heifers are shown in the upper part of the engraving; that upon the left hand is the "Queen," said to weigh 3000 pounds. Of the two steers below the heifers, the one in the foreground is the "Champion," said to weigh not far from 4000 pounds. All these cattle are high grade Shorthorns. As to their pedigree, or the particular strain from which they originate, no particulars have been given. They are all six years old, and for the first three years were not forced in any way. They were not suckled by a nurse, nor did they suck two cows. Indeed, they were weaned at less than a week old, and after the first two months, received only skimmed milk, with a handful of wheat shorts per day. After four months they were weaned from milk, and were fed upon pasture, with a sufficient quantity of grain in the winters to keep them constantly growing. Since then they have been fed upon pasture, with hay from early cut grass, in summer, and in winter, the same kind of hay with 8 to 10 quarts of corn and oat meal per day. Sugar beets and sweet apples have been given to them occasionally, but only in such quantities as

would serve as a relish and provoke an appetite for their regular food, and aid its perfect digestion. These cattle were exhibited in September, at the Western N. Y. fair at Rochester, at the Central N. Y. fair at Albany, and at the first exhibition of the Hudson River Agricultural Association, held at Poughkeepsie in Oct. At the last named fair they formed the chief attraction, being near home, where the animals were well known and popular. During the month previous to this they traveled 1000 miles, and, under good management, lost little or none of their weight. The "Queen" and the "Champion" are to be fed another year, with the intention, if possible, to make them the heaviest heifer and steer that have yet been raised. It is probable that the steer is now heavier than the famous "Ketton ox" which was raised by Mr. Chas. Colling, one of the early English Shorthorn breeders, in 1796, and weighed 3780 pounds alive, when 6 years old. We should judge by the handling of "Champion," that he can be made considerably heavier than he now is. It would do much to make Shorthorns popular, if breeders would feed either pure bred animals or high grades in this manner for beef frequently, and give less attention to mere pedigree. If high pedigree stock does not produce cheaper or better beef than any other, it is difficult to fix wherein its excessive value lies. The butcher's block is, after all, the final criterion by which high and low bred alike must be judged. The sight and touch of a living animal are both greatly inferior to the final test of all—the dressed quarters. Farmers who feed beeves look to this test for their profits, and if they are frequently made acquainted with such samples of what Shorthorn blood can produce, as are here illustrated, they will be the more ready to invest in the purchase of bulls than they now are.

An Easy Wagon-Spring.

"Torsion" is the act of twisting, just as one twists or wrings a wet cloth to get rid of the water. The resistance of a steel rod to torsion, and the force with which it springs back to its place, are very great. The strain upon the fibers of the metal is much less in this case, than when a piece of steel is bent, and a torsion spring is therefore one of the most elastic and

Fig. 1.—TORSION WAGON-SEAT SPRING.

durable known. A wagon or seat-spring, made upon this torsion principle, by Schenck & Sheri-

dan, of Fulton, N. Y., is here illustrated. The seat-spring is shown in fig. 1, and it is, upon trial, found to be remarkably easy. It is calculated to bear any weight up to 800 pounds, without losing any of its elasticity, or breaking. Figure 2 shows a spring intended for a wagon-

J.W. Fasel

A CALIFORNIA WEED—DODDER UPON ALFALFA.

body. It is calculated for a weight of 800 pounds to each spring. Two will thus bear 1600 pounds. A spring for wagon-tongues is also made upon this same principle; it is said that there are some thousands of railroad cars now running, which are furnished with springs of this kind. In a recent test a set of springs were taken from beneath a car after three years' use, and were as perfectly elastic as when first put in. The strength of springs made upon the torsion principle is so great that one made of 3/4-inch steel-bar will bear a load of 7,000 pounds, and still be perfectly elastic under it.

A Dangerous Weed in California.

Improved agriculture is of so recent a date in California, that but few of the pests in the way of insects and weeds that trouble the cultivator in the older States, have come to plague his California brother. Alfalfa or lucerne is one of the staples of Californian agriculture, and a weed that threatens the destruction of this crop, is a matter of the first importance. Notices of a particularly troublesome dodder have appeared in the California papers, and we are indebted to the kind attentions of our friends of the Pacific Rural Press, of San Francisco, and of the Sonoma Democrat, for specimens, and to make an engraving of it. Almost every

one knows our common dodders, which hang their yellow or copper-colored, wiry stems over the bushes in the swamps of the Atlantic States. There are ten native species east of the Mississippi, several more west of that river, and about seventy species thus far known throughout the world, all of which, with their varieties, are admirably described in Dr. G. Engelmann's elaborate account of the genus. The dodders are all parasites; the seed germinates in the ground, and the stem attaches itself to some other plant; by means of numerous disks or suckers, it draws upon the other plant for nutriment, and soon cuts itself loose from the root, and feeds wholly upon its unfortunate host. Some dodders live upon exogenous plants indiscriminately, while others prefer particular plants, or those of certain families; one confines itself to flax, which, besides the one in question, is the most generally injurious. One of our native species has been known to be troublesome upon young trees in nurseries. The dodder upon alfalfa, so far as we can determine from description, having no authentic specimens for comparison, is *Cuscuta racemosa*, variety *Chiliana*. The species is a very variable one, and between it and related species there is some confusion. The seeds of this were no doubt introduced into California with alfalfa seeds from Chili, the same as it was into Europe many years ago, where it was very destructive to lucerne, often destroying whole fields. The engraving shows the habit of the weed; when once fixed, it spreads and entangles the several branches of a plant, or those of neighboring plants; under this heavy draught made upon its life-blood, as we may regard the sap, the lucerne ceases to grow, and at length turns yellow, and dies from exhaustion. The Sonoma Democrat publishes an opinion that the dodder now so troublesome upon the alfalfa is a native species, but an examination of the specimens makes us quite sure that it is not. One not acquainted with the minute characters, by which the species are distinguished, might, from their outward resemblance, regard them as the same. At the lower left hand of the engraving the relative size and shape of the two seeds are shown, both of course magnified. The alfalfa seed is like a minute, rather flattened, kidney bean; that of the dodder is irregularly orbicular, and only about one-third as long as the other. An ordinary magnifier will readily detect the presence of this or other foul seeds in the alfalfa seed. With this, as with other weeds, one important point is to avoid introducing it, and care in selecting the seed will do this. Where it makes its appearance the most prompt measures should be taken to prevent its spread. Cut the infested plants, and burn them, and do this before the parasite has matured its seeds. If the dodder has too full possession to allow this to be done, then the plan followed in France, (where a dodder, and probably the same species, is destructive,) may be adopted. Straw

Fig. 2.—TORSION WAGON-BOX SPRING.

is laid in abundance among the plants in a dry time, and is then set on fire; the sudden flame destroys the parasite, but does not materially injure the alfalfa, which starts from the roots, and the stems, that escape injury by the fire.

The Badger Hound, or Basset.

When we advocate, as we have often done, stringent dog-laws and their strict enforcement, it is not from any antipathy to dogs. There are dogs and dogs, and we make a distinction. That some dogs are not only pleasant and companionable, but highly useful, we have no more doubt than that the great majority are useless and injurious, and should be taxed out of existence. Upon a farm, especially, a good dog is valuable, and if its value includes an ability to aid its master in hunting, all the better, for there are many more farmers who need the recreation that hunting affords, than there are those who neglect their duties and waste their time with the gun. Believing in the utility of some dogs, we regard the introduction of a new and meritorious breed as a matter of sufficient interest to give a portrait of a Badger hound, which is sufficiently rare in this country to be regarded as new, as there is only a small pack of them owned by a German gentleman in Hoboken, N. J., and a few others scattered about the country. This dog is known to the Germans as *Dachshund*, or badger hound, and to the French as *Basset*, and if we accept the descriptions given by writers of both these nationalities, it possesses a remarkable combination of excellencies. There are two divisions of the breed, those with straight and those with crooked legs, the last-named being preferred. The general appearance of this dog is not prepossessing; as Gayot, the great French authority, remarks, it is more strange than graceful; the head is long and pointed at the muzzle, and the ears very long, so that when the animal is running they touch the ground; the neck is thick, body long, and the tail long and slender; the legs are remarkably short in proportion to the body, the fore-legs being singularly bowed, while their large feet turn outward; the hair is short, and usually with brown or black markings on a white ground. On account of

their shortness of limb, these dogs are only 13 to 16 inches high, and for the same reason they run slowly, and the hunter can keep up with them without difficulty. Their expression of countenance is peculiar, it being an oldish and at the same time attentive look. They

furnished by the friend who shot the specimen. Naturalists at present separate the Rails into two genera, the old genus *Rallus*, including the Virginia, the Clapper, and the King Rails, while the common Rail or Sora, the Black Rail, and the present species, are in the genus *Porzana*;

YELLOW-BREADED RAIL.—(*Porzana Noveboracensis*.)

have a keen scent, and in Europe are used for hunting almost all kinds of game, especially rabbits and deer, and such is their courage that they will even attack the wild boar. They are regarded as especially valuable in destroying all animals that are injurious to the farmer.

The Yellow Breasted Rail.

One of our associates having had the good fortune to bag a Yellow-breasted Rail, we

reddish, with spots of white; chin white; thigh feathers blackish; line over the eye cinnamon brown; length from tip of bill to tail, about six inches. This, the smallest of the Rails, is so retiring in its habits, and skulks so persistently among the reeds and tall grass which border the water courses and drains of our meadows, that it is very rarely obtained, and therefore the least known of its kind. The writer, in an experience of twenty-three years' shooting upon meadows and marshes,

THE BADGER HOUND, DACHSHUND, OR BASSET.

have had an engraving made of the specimen. Those interested in birds, either as objects of natural history or as game, will be glad to know something of this, one of the rarest of all Northern birds, and we give the following account of it, mainly from notes

has obtained but two in all that time, and has heard of but two others being shot, one at Gravesend, L. I., and the other on the salt meadows of the Hackensack, N. J. The Yellow-breasted Rail takes wing very reluctantly, and will only rise when hard pushed by the dog; it then flies but a few yards, with neck outstretched and legs hanging down, and soon drops among the tall reeds, where it runs with such amazing swiftness, that further pursuit is useless. It is chiefly met with

by Snipe shooters, when in pursuit of their favorite game. As this bird bears a considerable general resemblance to the European Quail, it was called by one naturalist (Latham) the Hudsonian Quail. It lays from ten to sixteen pure white eggs among the grass, making no nest—or at

all events such a rude attempt, that it can hardly be called one. Although so rare a bird at the North, it is more common in the Southern States. Audubon states that he found it at all seasons of the year in Louisiana, where it builds a nest, and raises two if not three broods in a season; he regards the fact of its not building a nest at the North, as evidence that it has strayed beyond its proper limits; yet they are found as far north as Hudson's Bay. The flesh of this bird is highly esteemed. Early in the morning it makes a peculiar cry, which has been compared to that produced by the striking together of two pieces of stone, some liken it to the sound of flint and steel, and others say that its note resembles the croaking of a tree-toad. It makes its appearance near New York early in the spring, and remains until the frosts come, when it disappears suddenly, as is the habit of all the rails. The specimen here figured, was shot in the month of September, of the present year, on the meadows back of Bergen, N. J. Its food consists of aquatic insects and seeds.

Walks and Talks on the Farm.—No. 132.

[COPYRIGHT SECURED.]

The Deacon came in the other evening to talk over matters, and I said to him:

"Here is something, Deacon, that ought to please you! Prof. Daniels delivered an able address at the Wisconsin State Fair on *Hard Times—A Cause and a Remedy*."—"It would please me," said the Deacon, "to hear of a remedy."—"We must first ascertain the cause, Prof. Daniels attributes it mainly to a great over-production of wheat and corn in the Western States. I will read you what he says:"

"The present condition of Western farmers was long ago predicted, if they continued to depend upon the production of corn and wheat for their revenue. In 1864, the Superintendent of the Census said: (*Agriculture of the U. S. Census, 1860, p. 42.*) 'For some time before the war our Western farmers were beginning to complain that wheat-growing was not profitable, that the cost of transportation left them barely enough to meet the cost of production—and it was argued, wisely as we think, that it would be more profitable to grow less wheat and raise more cattle, pork, and wool, the cost of transporting which, in proportion to value, is much less than that of a more bulky produce. * * * The Western farmer, for a year or two, has been receiving high prices for his produce. *He would do well fully to understand the causes which have led to this result.* They are by no means permanent.'

"Speaking of the increased demand for wheat then existing, he says, it 'will for some years, probably, keep prices high enough to make wheat-growing in the West exceedingly profitable. The time must be expected, however, when the Western farmer will again find the cost of sending wheat to the Eastern cities, and to Europe, so high as to leave him barely margin enough to pay the cost of production.' These," says Prof. Daniels, "wer timely words of wisdom. No one could to-day tell more surely what has become a sad reality in the West, than these words, written ten years ago, foretold would come to pass, should the course then pursued by farmers be persisted in."

The Deacon put on his spectacles, and drew near the lamp on the table. "Let me read that myself," he said. "I don't see what there is in that should please me."—"Why," said I,

"have you forgotten where those 'timely words of wisdom' came from? Prof. Daniels did not know that they were written in this quiet farm house. You and I talked the matter over again and again. 'No one,' says Prof. D., 'could to-day tell more surely what has become a sad reality in the West, than these words, written ten years ago, foretold would come to pass.' And yet some people are disposed to think a man can know nothing of farming unless he lives west of the Mississippi River. You and I, Deacon, worked at odd times over a year studying the Census returns, and making new tables showing how much we produced in the different sections, in proportion to population, in 1860 as compared with 1850. I was promised \$10 a page for the work. We prepared 130 large pages of the Introduction, and after it was printed I sent in my bill. They sent me a check for \$450, and said I should have the balance in a month or two. But I have never received another dollar. When we send more farmers to Congress and fewer politicians, you and I, Deacon, will present our claim. It has never been disputed. In fact it has been 'allowed'—but never paid."

"I did not know," said the Squire, "that the Deacon and you were able to tell ten years in advance what was going to happen."—"We can tell," I replied, "that if you neglect your farm it will not improve. If you starve your cows this winter they will not give a large flow of rich milk next summer. If you sow foul seed, you will not have clean crops. We know that if a young man spends his days reading novels, and his evenings at the tavern, he will not increase in knowledge and wealth. If you keep a young apple orchard in grass, and do not manure it, or if you sow it every year to oats, wheat, corn, potatoes, or rye, and take off the whole crop and put nothing back, we know that ten years from now your apples will neither be large nor fair, nor command the top price in market. We know that people will want something to eat, drink, and wear, and that wheat, potatoes, fruit, beef, mutton, pork, cheese, butter, and wool, will be wanted in the future as in the past. We know that, other things being equal, the farmer who can produce the best article at the least cost, will make the most money."

And now, while we are talking on this subject, let me predict again. Good farmers are going to see better times than we have had for some years. I do not know this, but all the indications point that way. The farmer in this section, and especially in the West, who drains his land, kills the weeds, cultivates thoroughly, gets his crops in early, and gathers them in season; keeps good stock, and feeds out nearly all that he raises; the farmer who makes rich manure, and saves and applies it judiciously, has a fair prospect of getting pay for his care, labor, intelligence, and enterprise. Good tillage, and rich manure should be our motto.

I have received a letter, commencing as follows: "A Committee was appointed by the Eastern Experimental Farm of Chester Co., Pa., to investigate the subject of Cooking and Steaming Feed for Stock."—Ah well, I said to myself, now we shall perhaps learn something definite in regard to this much discussed subject. It has been talked and written about for half a century or more. So much so, that when I see an article in any of our agricultural papers headed "Cooking Food for Stock," I invariably and by instinct skip it. Not that the subject is unimportant, but that until we get

some well-planned and well-tried experiments, all has been said for and against the practice that can be said. I was very glad to hear, therefore, that the Eastern Experimental Farm was going to investigate the matter. Prof. Miles, of the Michigan Agricultural College, is also about to make some careful experiments. But the more we have the better. Our Agricultural Colleges should work together. Each should know what the other is doing, and take up different branches of the same subject. But what is the next sentence in the letter? "They mean to make an exhaustive report, and take the liberty of asking you to have inserted in the *American Agriculturist* a notice of the same, requesting information from all quarters, pro and con, in regard to this matter."—And so, it seems this Experimental Farm is not going to make an Experiment on Cooking Food for Stock—they are to make an "Exhaustive Report." Please don't! Our agricultural papers are by no means destitute of enterprise. If there are any trustworthy facts, they will get hold of and publish them. We do not need Experimental Farms to do this kind of work. If we could get at agricultural facts by holding conventions, making reports, and passing resolutions, we should soon place agriculture on a scientific basis. I was once at a Meeting of the American Dairymen's Association, when the following resolution was offered and of course passed:

"Resolved, That this Convention is of the opinion that corn is a valuable product for the dairy-farm, and that we commend it as a forage crop."

I voted "aye," but I could not help thinking that one experiment would be worth a whole car-load of such resolutions.

"You believe in cooking food for hogs," said the Deacon, "your steamer seems to be going almost night and day."—Yes, but I am working in the dark and no "report" will give me light. I suppose cooking makes some kinds of food more easy of digestion. And when you are trying to push young pigs along as rapidly as possible, or when you are fattening well-bred hogs that can assimilate more food than they can digest, then cooking will probably pay. At the present time, corn is so high that we cannot afford to let any of it pass through the animal undigested. In fattening hogs, the great aim should be to make them eat just as much and no more than they can digest. There are hogs that can digest more corn than they will eat. In this ease there is nothing to be gained by cooking—unless it will induce them to eat more. I would give them all the cooked or fermented food they would eat up clean. I would then pour a little more into the trough. They will fight over it and eat it up. Then give a little more, and so on until you are sure they will eat no more of this cooked food. Then throw an ear of corn into the pen, and let them try to get it away from each other. Every extra ear of corn you can get them to eat and digest, will give you nearly or quite as much pork as the corn contains. A large proportion of the food of animals is used to support respiration and the vital functions. The growth comes from the food eaten and digested in excess of this amount. It takes some time and not a little sense to feed pigs in this way. But it will pay.

Now, on the other hand, if your pigs will eat more than they digest, there may and there may not be an advantage in cooking their food. If the cooking or fermenting will enable them to digest more food, then, at the present high

price of corn, it will pay well. "I don't think it pays at all," said the Deacon, "to feed hogs corn at present prices."—I think it does, but that is not what I meant. That is another question. What we are talking about now, is whether in case you feed pigs at all, it will pay to cook the food for them. It certainly will not pay to throw bushels of corn into a pen of coarse, ill-bred, ravenous hogs, and let them pass one-third or one-half of it undigested. A good appetite is a good thing. A good digestion is better—what we want in a pig is both.

"You have said this same thing over and over again," said the Deacon, "for the last 8 or 9 years."—Yes, and I mean to say it again and again. It must be understood before we shall make any real improvement in breeding pigs. Mr. LAWES has recently advocated the same doctrine, and we may hope that it will attract more attention. "From the results of numerous experiments made at Rothamstead," says Mr. Lawes, "it may be assumed that on the average, a pig weighing 100 lbs. will, if supplied with as much barley-meal as he will eat, consume 500 lbs. of it, and double his weight—that is, increase from 100 lbs. to 200 lbs. live weight in 16 or 17 weeks. The following table shows the amount of dry or solid constituents in the 500 lbs. of barley-meal, and how they will be disposed of in the case supposed :

500 LBS. BARLEY-MEAL PRODUCE 100 LBS. INCREASE AND SUPPLY.

	In food.			
	In 100 lbs.	In 100 lbs. of increase	In manure	In respiration, etc.
Nitrogenous substance.....	52	7.0	59.8	276.2
Non-nitrogenous substance...	357	66.0		
Mineral matter.....	11	0.8	10.2	
Total dry substance.....	420	73.8	70.0	276.2

"From the figures in the table," continues Mr. Lawes, "we learn that of the 420 lbs. of dry or solid substance which the 500 lbs. of barley-meal contain, about 74 are stored up in the 100 lbs. of increase in live weight, about 70 are removed in the manure, and 276, or nearly two-thirds of the whole, are given off into the atmosphere by respiration and perspiration"—that is to say, we expended this amount in the mere sustenance of the living meat and manure-making machine, during the 16 or 17 weeks required to produce the 100 lbs. of increase.

"But now," says Mr. Lawes, "let us suppose that, instead of allowing the pig to have as much barley-meal as he will eat, we make the 500 lbs. of meal last many more weeks. The result would be that the animal would appropriate a correspondingly larger proportion of the food for the purposes of respiration and perspiration, and a correspondingly less proportion in the production of increase. In other words, if the 500 lbs. of barley-meal be distributed over a longer period of time, it will give less increase in live weight, and a larger proportion of it will be employed in the mere maintenance of the life of the animal. Indeed, if the period of consumption of the 500 lbs. of meal be sufficiently extended, the result will be that no increase whatever will be produced, and that the whole of the food, except the portion obtained as manure, will be expended in the mere maintenance of the life of the animal."

"Why this," said the Deacon, "is precisely your old doctrine of the advantage of having animals that are 'great eaters'—a doctrine which is hard to swallow when corn-meal is \$2 per 100 lbs."—"No Deacon," I replied, "Mr. Lawes does not go as far as that. He does not

say, as I do, that there is an advantage in having an animal that will eat, digest, and assimilate a large amount of food in a given time. He says there is a great loss in not giving a fattening pig all the food he will eat, digest, and assimilate. I push the doctrine a step further, and aim not merely to give the pigs all they will eat, but endeavor to raise a breed of pigs that will eat, digest, and assimilate a larger amount of food, at the same time aiming to breed them of a quiet disposition, and with the least possible proportion of offal. I wrote my little book on the pig for the purpose of advocating this doctrine. If true of pigs, it is true of other domestic animals. I am very glad that Mr. Lawes has called attention to this subject. It is time we aimed to breed pigs that do not require two-thirds of all the food they can eat to 'run the machine.'"

Every year I am aiming to get less and less fall work. We are busier in October than any other month in the year. And it is work that *must* be done. The days are short, the weather uncertain, and wages high. We greatly need a good potato-digger, and a corn-husking machine. So far as I have seen, the machines now made for husking are too small and too slow. Farmers do not want more machines than they have now. We want to keep fewer machines of our own, and hire the work done by skillful men, who keep a large steam-engine and the necessary machinery for doing the work up rapidly.

"Your Late Rose potatoes," said the Deacon, "helped you forward with your fall work more than all the machines you are likely to get for some time." The Deacon is right. I have hitherto planted the Peachblow. It has been our surest and best winter variety. But it runs over the ground almost as bad as Compton's Surprise, and is hard to dig. Besides it is very late, and often keeps on growing until November. Two years ago, last spring, Mr. E. L. Coy sent me a peck of his Late Rose potatoes. I planted them in the mangel lot, where they had plenty of manure, and I had a great yield. The next year (1873) I planted half an acre or more side by side with Early Rose and White and Red Peachblows. The Late Rose were by far the best crop. I put over 100 bushels in the cellar, and thought nothing more about them until February, when, happening to be at New York, I called on B. K. Bliss, and had a talk about the new varieties of potatoes. I told him that I thought the Late Rose a decided acquisition.—"There are three or four kinds of Late Rose," he said. "Where did you get your's from?"—I told him Mr. Coy made me a present of a peck.—"Oh!" said he, "you got it from headquarters. Mr. Coy originated the variety, and you ought to take care of it."—On coming home, I found that these potatoes, being so large and fine, were decidedly popular in the kitchen, and that we had been eating them all winter. After that I made them eat Peachblows, and we planted this spring all the Late Rose we had left. As the Deacon says, this fact helped me greatly with my fall work. As soon as we were through digging the Early Rose, we commenced on the Late Rose, and were all through digging them two or three weeks before the Peachblows were ready. This is a great advantage.

I think the Late Rose will stand high manuring. And as the "bug" is upon us, this is what we want. We shall have to go over our potato field two or three times next year with Paris green. It will cost no more to go over an

acre of potatoes that will yield 300 bushels than over an acre that will yield only 100 bushels.

We should get our manure ready for potatoes this winter. I have commenced my pile already, and it is fermenting nicely, and will keep on fermenting all winter. But it is not yet too late to start a heap. All there is about it is simply to wheel the manure into a heap in some central position, and every day, or as often as the stables and yards are cleaned out, wheel the manure to the heap and spread it *on top*, instead of scattering it over a large surface.

If the manure does not ferment, it is probably because it is too poor. The droppings from the hen-house, if scattered upon the heap and covered up, will help it. When you kill pigs, save the blood and pour it on the heap. Any animal matter will be good. If the heap is dry and cold, the hot water, hair, etc., you have left after scalding the pigs, can be poured on the heap to advantage. In my case, the horse stable is separate from the rest of the buildings. We throw the horse litter into an empty stall, where it will keep dry. Every week or so we put this horse litter in a cart and draw it to the pig-pens. Here it stays until it gets saturated with the rich liquid from the pigs, and is then wheeled to the heap. There is no difficulty about getting such manure to ferment. It will be in prime condition for potatoes in the spring.

"I saw somewhere," said the Squire, "a plan of making rich manure, by putting plenty of straw in the stable and not cleaning it out until the spring."—That is the plan they call "stall-feeding" in England. The animal is put in a loose box and kept well littered. He moves about and keeps the bed level and solid. But in a cow stable, where the cows are tied up, you can not adopt this plan. In a large shed, or basement, where the animals run loose, the plan is a good one—and nearly all our farmers adopt it. The only objection to it is that the manure is not sufficiently rotted for spring crops. John Johnston adopts this plan, but he piles his manure in the spring and keeps it over the summer, to be used as a top-dressing on grass in the fall. The proper management of manure depends greatly on circumstances. The first point is to save all the liquid. The next is to keep the animals clean and comfortable, and the atmosphere of the stables pure. The next is to ferment the manure as much as possible without loss. If this can not be done to advantage, give it up. It is only a loss of time. It is using the manure in the fall instead of the spring; or using it in the green state for corn. The latter plan is the one generally adopted by the Deacon. I do not like it. I think, in my circumstances, my plan of fermenting the manure all winter in a heap, and turning it if necessary towards spring, is better than plowing under this long, strawy manure. It gives me manure in good condition for potatoes or mangels. But if the Deacon's plan is the only one you can adopt, you may console yourself with the reflection that there is no loss from fermentation or leaching. You get all the virtue there is in it, but you will have to wait some years before you get the full effect of the manure.

BEEF FROM COLORADO.—Dressed beef is now shipped in refrigerator cars from Denver, Colorado, to the New York market. Two cars recently arrived, which contained the carcasses of 34 beeves, 50 calves, 199 sheep and 20 ante-

lopes. It being well established that meat can be thus shipped either from Texas or Colorado to eastern markets, it is to be hoped that the transportation of live cattle, with all its cost to the owners or consumers of the meat, and all its misery to the poor beasts, may in time be made unnecessary.

A Self-Supplying Feed Box.

In the accompanying illustration is shown a feed-trough for poultry or pigs, in which a large stock of feed may be kept so as to offer a continuous supply. It consists of a square or oblong box, with a trough upon each side, or all around it, as seen at fig. 1. The box is raised a few inches above the ground, by the projection of the ends downwards. Spaces are cut in the sides, half an inch wide, and several inches

Fig. 1.—FEED BOX IN USE.

long, by which the grain escapes into the troughs. The floor of the box is made of two sloping boards, as shown by the dotted lines, by which the grain is made to fall towards the troughs. A broad-eaved roof is placed above to shed the rain. The box is filled by inverting it and opening a small door, shown in fig. 2, through which the grain is poured until the box is full. This contrivance will be found of great value

Fig. 2.—BOX INVERTED FOR FILLING.

in promoting the health of poultry, by ensuring a regular supply of clean food. Grain scattered upon the ground is likely to be picked up along with much filth and other matter, and frequent-

ly, without doubt, the ova of injurious parasites thus find their way into the bodies of the fowls. Where fowls are kept clean and cleanly fed, they are free from disease. "Gapes," pip, roup, and other disorders are in a great measure the results of uncleanness or infection thus engendered, and the fouling of the food or water by the filth of the yards, or that from the fowls' feet, is, without doubt, the most common cause of the ills of the poultry yard. In giving fowls a constant supply of food, there is no danger that they will over-feed themselves; on the contrary, it is when fowls are irregularly fed that they gorge themselves.

Horse Clothing.

A great many more horses are prematurely worn out by neglect than by hard work. Cold kills more than work does. Sudden chills, when they are warmed up by severe exercise, ruin numberless horses. In how few stables can a good set of blankets be found? These are always seen in the stables of valuable horses, but rarely elsewhere. But a cheap horse feels and suffers from sudden changes as much as a costly one, and humanity calls for proper care of such a one as much as for any other. Nor should the lap-robe, or the buffalo-robe, with which the driver protects himself, be used to cover the horse while he stands for a short time. This conveys the disagreeable smell of the animal's not always clean skin to the clothes, from which it is plentifully evolved and diffused when a warm room is entered. The horse should be provided with blankets for its special use. These need not be costly, and may be easily made at home. A pair of coarse, heavy brown wool blankets, costing \$5, will make a very serviceable suit of horse clothing. The clothing should be made in two parts, one to cover the back from the withers to the crupper and reaching beneath the belly, and another to cover the neck and throat; both should be lined with gunny cloth to strengthen them. The neck and chest of a horse are very sensitive parts of the animal, and need ample protection as well as the body. The body clothing should be made of two pieces, cut so as to admit of two gores; one short narrow one upon the rump, and one longer wide one at the withers. These should be cut so that the blanket fits smoothly to the curve of the back, else it will not lie in its proper place, but will slip down and gather in wrinkles in the middle of the back. A saddle piece of stiff cloth should be stitched upon the blanket, and two slits worked in it upon each side, through which the girth is placed to retain it in its place. Two straps and buckles should be stitched in front to fasten the blanket close upon the chest, and it should be bound with a broad strip of colored flannel. The throat-piece should be carefully cut to fit the neck, and be made low

enough to lap over the blanket for several inches, as is shown by the dotted line in the illustration. A strap is fastened to go across the forehead to hold the covering in its place, and others are attached by which it is fastened beneath the throat. This part of the clothing should be bound and trimmed to match the blanket. These coverings should not be worn in the stable, but only out of doors, when the horse is exposed to cold winds, or when it is standing after having been warmed by work. No stable should be so exposed as to make it necessary to blanket a horse when within it. Stables should be tight and warm, and ventilated in such a manner as not to throw cold drafts upon the horse. Pure fresh air in the stable, although it may be of a low temperature, will so invigorate the circulation of a horse that no protection beyond its own natural covering will be needed, even in the coldest

A SUIT OF HORSE CLOTHING.

winter weather. It is when brought out from the still air of the stable into the cutting winds that the animal needs covering, or when a careless driver leaves him steaming, after a brisk drive, standing in a December snow-storm, while he is warming himself before a hot stove.

Hungarian Farm Tools.

In many things the agriculture of Hungary greatly resembles our own, and occasionally we find a useful hint from observing their ways and methods. At the Vienna Exposition of last

Fig. 1.—HUNGARIAN SEED-COVERER.

year, a large number of Hungarian farm implements were shown, and amongst them, the two which are here illustrated. Figure 1 is a seed coverer for use upon fields that have been sown broadcast. The soil previously plowed, harrowed, and sown, is worked over with this implement, drawn by horses or oxen. Its action is easily understood. The seed is covered, as is

often done by the plow, but much more rapidly. Where drills can be conveniently used, this implement would answer a very good purpose, covering the seed to a more even and certain depth than the harrow, and one stroke being sufficient. Figure 2 shows a roller that has

Fig. 2.—HUNGARIAN DOUBLE ROLLER.

several excellent points. It is a double-ridged one, and as the rollers revolve, each of them rubs or grinds upon the other, thus always ensuring clean surfaces. Such a roller as this, made of cement, upon the principle recently illustrated in the *Agriculturist*, (Sept. 1874,) would be a very serviceable implement, both for crushing clods, or rolling newly sown grain fields.

Concrete Houses.

We have, on various occasions, described the method of building houses in concrete, but it seems, from the numerous inquiries we receive, not at sufficient length to give all the information needed. To build a cellar wall or a barn needs but little skill, but to build a dwelling-house, with doorways, windows, cornices, and

Fig. 1.—A LIME KILN.

other requisites, in which some degree of ornamentation is desirable, needs more skill and more particular instructions. The use of concrete is not advisable where brick or stone of a desirable character can be readily procured; but where these are not available, and the materials for concrete are upon the ground or near by, it is then that it becomes an economical material. The requisites are lime, cement,

Fig. 2.—MIXING BOARD FOR CONCRETE.

sand, and coarse gravel, or broken stone, broken brick, either new or from old buildings, or slag from furnaces, and coarse ashes. Where lime is not to be procured, the limestone may be burned in a kiln of very easy construction, shown in fig. 1. This is dug out in a bank and

lined with common clay or stone to confine the earth. A stone arch is made in the front, seen at *A*, and the front (*B*) should be supported by a rough stone wall. The limestone is placed in layers with coal, or it may be burned with wood by means of a fire-hole made at the rear of the arch. The lime, with the layers of coal intermingled, is shown at *C*, and at *D* are seen a few large pieces of stone heaped on to the top to retain the heat. When lime is used to make the concrete, it is best to reduce it to powder by grinding in a plaster-mill before it is slaked. Where this is inconvenient, it may be carefully slaked to a dry powder by using water just sufficient to effect this, and no more. It should then be sifted and freed from all unslaked lumps. If this is neglected, the lumps will become slaked after a time by the moisture of the atmosphere, or that in the wall, and in swelling burst and damage the wall. When cement is used, the kind known as the Rosendale will answer as good a purpose as the Portland cement, which is imported and is much dearer. The foundations may be made of lime concrete; it is not necessary to use the more expensive cement in these. The first work is to dig the cellar, or the trench for the foundation. This, if there is no cellar, should be at least three feet deep. The next is to gather upon the spot all the materials for the building in as fully prepared a condition as possible. The mixing boards are then to be made. These should be 12 feet by 7, made of 2-inch plank closely spiked upon cleats, and leading planks should be provided upon which to bring the materials in wheelbarrows. Fig. 2 shows the mixing boards; the plank at *a* leading to the building, the one at *b* to the lime, that at *c* to the gravel, that at *d* to the broken stone, or coarse materials, that at *e* to the sand or fine stuff. These materials should be prepared and heaped around the mixing board, so that they can be conveniently reached. The proper proportions to use are one part of lime to seven of other material, large and small, the coarse and fine being about equally divided. The materials are heaped up as seen at fig. 3, the letters *a*, *b*, *c*, *d*, showing the relative position in the heap of the lime, sand, gravel, and broken stone.

The mixing should be done systematically to ensure success. The heap should be turned over while still dry, by commencing at the middle, as seen at *A*, fig. 4, throwing each half outwards, which will make two heaps, as at *B*;

Fig. 13.—CONCRETE COTTAGE WITH BRICK ORNAMENTS.

these are again thrown together in the direction of the arrows seen in the figure, making again one heap as at *C*. Water is now added sparingly, and the heap again divided and brought together as before, until the whole is thoroughly mixed. When cement is used instead of lime, the mixing is to be done in the same manner, excepting that it should be in smaller quantities at one time, and should be used as soon as it is mixed, as it sets or becomes hard very

Fig. 15.—CONCRETE COTTAGE WITH BRICK ORNAMENTS.

rapidly. The finer the broken materials are, the stronger will be the concrete when cement is used. At figs. 5, 6 and 7 is seen the method of laying the concrete. Stout wooden posts are set at each angle of the walls, and are kept at an even distance apart by bolts or cross-

pieces of wood, and are stiffened with stays from the ground. Planks with smooth surfaces for each face of the wall are then laid inside of the posts around the whole length of the building, or intended walls. A piece of

Fig. 3.—THE MIXING HEAP.

iron, shown in fig. 10, is used to prevent the planks from bulging outwards by the pressure of the concrete. These clips are also shown at *a, a*, figs. 5 and 6. The clips, or clamps, are made tight by wedges driven between their ends and the planks, as seen in fig. 9, and at *b, b*, figs. 5 and 6. The walls may be made 9 inches thick or more for the outer ones, and 6 inches for partition walls.

When the trench formed by the planks is filled

Fig. 4.—MIXING THE HEAP.

up, these are moved up and held to their proper place by means of counter wedges, seen in two different positions at *a, a*, figs. 8 and 9. Fig. 8 is a view looking downwards upon the wall, and fig. 9 looking endwise, showing the planks, *b, b*, and the clip and wedge, *c*; the posts are shown

Fig. 5.—ARRANGEMENT OF THE PLANKS.

at *d, d*. The planks should cover the concrete already laid at least 1½ inch, to prevent the fresh laid concrete from being forced out through any crevice. This is shown in fig. 9. In filling up the frame with concrete, it is best to arrange the work of raising the planks, mixing the day's supply of material, filling it in,

Fig. 6.—ARRANGEMENT OF THE POSTS.

and completing the job, so that all may be done by the close of the day, and the concrete be left undisturbed to dry and harden during the night, leaving everything ready for the

next day's filling. With such arrangements as these, no skilled labor is necessary, but the supervision of any intelligent owner or employer is sufficient, with faithful compliance with the simple directions here pointed out.

No scaffold-poles are needed in this plan: stout brackets may be nailed to the posts to support all needed staging. For the windows, doorways, gables, flues, and fire-places, special arrangements will be required. The door and window-frames should be built in, and a few nails driven through the frames, or a few cleats fastened thereto, will be sufficient to hold them firmly in their place. The joists are to be built into the walls, and a few spikes driven in the ends, or a cleat nailed to the upper part of each end, will

serve to hold them to the walls. This is shown in fig. 11. For fire-places wooden arches must be provided, and for the flues wooden cores, or molds, slightly tapering, so that they can be raised along with the wall, will be needed. If the wall is desired to be furred for lathing, pieces of wood should be built in the wall in the proper places. But this is a needless expense, as the concrete, being porous and a poor conductor of heat, no moisture gathers upon the inner surface of the wall by condensation in cold weather, the finishing coat of plastering may therefore be laid directly upon the wall. The writer has

lived for a year in a lime-concrete house in a cold northern climate, where brick-houses are always damp inside by reason of the constant condensation of moisture upon the walls in the winter, unless they are furred, but never discovered the least tendency towards dampness. This is one of the advantages of concrete houses, and not a slight one. One of the chief objections to concrete buildings, is their usual flatness, squareness,

and severely plain, not to say unsightly appearance. The walls are usually mere slabs set upon end, and pierced with square holes for windows and doors. Recently, however, the greatly enlarged use of concrete as a building material in England, has led to many improvements in the style and finish of this class of houses, and architects have turned their attention in this direction. Mr. George Hunt, architect and surveyor to the Royal Agricultural Society of England, has designed some plans for the ornamentation of concrete houses, which have been published in the Society's Journal, and which we gladly reproduce as suggestions, if not for models for our readers. The simplest improvement consists in using the finest broken materials for the face of the work, and backing that up with the coarser stuff. This gives a better finish. Then a brick or stone plinth may be put around the building, or a mold may be made by which moldings may be run around the base, with bases colored by the addition of some cheap earths. Brick arches, or colored blocks of

concrete, may be built around the doors and windows, with plain or chamfered edges, or these portions of the building may be stained

Fig. 7.—LAYING THE CONCRETE.

of some suitable color, or a somewhat different make of concrete of finer material, might be used for these portions. A great variety of new ideas will spring up from these hints and suggestions. Figures 12, 13, 14, and 15, illus-

Figs. 8 and 9.—RAISING THE PLANKS.

trate these details sufficiently to give a clear idea of them, as well as a good basis from which to greatly enlarge these ideas. In fig. 12 the "plinths" of brick or concrete are shown at *a* and *b*. At *c, d*, are shown details of "strings" in section; at *e*, the "string" *d*, is shown in perspective, and at *f* is seen a plan for window or doorway with head and jambs.

The elevation of the building finished in this style, is seen at fig. 13. The rafter-feet project a few inches, and a board of 9 inches in width, projects around the gables. Fig. 14 shows a more ornamental design. At *a* is the base which reaches to the lower floor window sills,

Fig. 11.—FASTENING THE JOISTS.

(as seen also in fig. 15), at *b* is the cornice, of brick work wholly or in part, with gutter.

At *c*, a cornice is shown with alternate bands of concrete and brick, or concrete of different colors. At *d* and *e* are seen plans of chimney stacks, that at *d* belonging to the elevation shown at fig. 13. The remainder of these details belong to the elevation shown at fig. 15. The crest of this roof is intended to be made of ornamental tiles. There is nothing in these plans but what are real, there are no shams or deceptive appearances which fail in use, and if

Legislation in Reference to Dogs.

Our correspondent, W. W. W., of Griffin, Ga., is interested in sheep culture, and wants to know what States have passed laws against dogs, and the proper requirements of a dog law.—We sent his letter to our friend "Connecticut," who returns the following as to the

DOG LAW OF CONNECTICUT.—The following statute was passed by the Legislature of Connecticut in 1867, and is still in force:

SEC. 1ST.—It shall be the duty of the Assessors of the several towns of this State, to cause all dogs, three months old and upwards, which have not been registered according to law previous to the first meeting of the board of assessors, to be entered upon the assessment list of persons owning such dogs; and such dogs shall be presumed to be owned by the keeper or occupier of the premises, where such dogs are kept.

SEC. 2ND.—The owner or owners of all dogs not registered as aforesaid, shall pay an annual tax into the treasury of the town where such dogs are kept, to be levied and collected with, and in the same manner as the ordinary town taxes, of three dollars for every male dog, and six dollars for every female dog.

Another act passed at the same session of the Legislature—provides that any excess of money in the dog-fund may be used for ordinary town expenses after all damages done to sheep in previous years are paid for.

In the general statutes of this State in section 113, it is provided that any two Justices of the Peace may make such rules and regulations against dogs as they think the safety of persons and property demand.

SEC. 114 provides that the inhabitants of the several towns in legal meeting assembled, may make necessary regulations and offer bounty for the killing of dogs.

SEC. 115 requires the owner of a dog over three months' old to register and number such dog in the Town Clerk's Office on or before Sept. 1st in each year, and to pay fifteen cents for registering.

SEC. 116 provides that he shall pay into the treasury two dollars for every male dog, five for every female so registered, and that he shall put

a collar upon his registered dog, with his name upon it and the number of the dog; and any person killing said dog shall be liable for his value. But any one may kill a dog found worrying sheep, whether registered or not.

SEC. 117 provides that the Town Clerk shall pay all monies, received for the privilege of keeping dogs, into the treasury.—**SEC. 118.**—

The Selectmen are to post notices in every school district, that dog owners must either kill their dogs, or cause them to be registered.

SEC. 119 inflicts fifty dollars fine upon the Selectmen who refuse to post such notices.

SEC. 120 fines whoever puts a false register upon his dog's collar seven dollars.

SEC. 121 makes it the duty of the first constable to prosecute all violation of the dog laws.

SEC. 122.—Those who suffer damage in their flocks by death or maiming from dogs, are to give information of the fact to one of the Selectmen of the town, who are to estimate the damage, and pay it from the dog fund, unless the owner of the dog can be made to pay.

These laws, of which we have given the outline, work well in Connecticut, and encourage sheep raising. They keep the dogs in check and make it easy for sheep owners to recover damage done to flocks where any is suffered. It is our impression that dog laws have been passed in most of the older Northern States, and that they are most stringent in New York and New England, where wool and mutton are most valuable. It is exceedingly desirable that we should have similar legislation in all the States, and that sheep husbandry should be made so safe and profitable, that we have no occasion to import wool. The census of 1870 reported 28 millions of sheep in the country, and 100 millions of pounds of wool as the annual product. And yet we import large quantities of wool and woolen goods that we ought to produce on our own farms and in our own factories. We are glad to believe that we are increasing our consumption of lamb and mutton. Give us stringent dog laws in all the States, and we might make these the cheapest of all the meats in the market. **CONNECTICUT.**

FOREIGN STOCK SALES.—At the recent sales of the Duke of Devonshire's Shorthorns, the average price realized for 28 cows and heifers, and 15 bulls, was about \$1,970 each. The highest prices obtained were for two cows, \$5,250 and \$5,775. At the Earl of Bective's sale, which followed this, 43 animals brought an average of \$1,920. The animals sold at these sales were by no means the best of the herds, these being reserved. At a sale of Shorthorns belonging to Mr. Cheney, and R. Parvin Davis, occurring soon after the above, the 8th Duchess of Airdrie brought \$8,927, and a yearling heifer, the Duchess of Gloucester, \$9,373. Both of these were American bred animals. The average of Mr. Cheney's sale was \$2,095 each, for cows, bulls, and calves; and that of Mr. Davis' sale was \$1,250 each; the latter sale was of all English bred animals. At a sale of fine Hereford cattle, belonging to J. B. Green, of Knighton, a lot of 108 cows and heifers sold for an average of \$222. One cow brought \$650, and one heifer calf \$400. The average of 14 bulls was \$205. A large number of this herd were descended from a cow which lived and bred up to an age of 26 years. At a sale of black polled cattle in Scotland, 23 cows brought an average of \$216 each. A fine bull brought \$500; bull calves sold for \$80 to \$300, and heifer calves for \$50 to \$180. The disparity between these latter unfashionable and the former fashionable stock, does not rest upon a difference in intrinsic excellence by any means, and when we know that three Herefords can be kept where two Shorthorns can, and that the herd referred to here, was bred and fed upon the top of a Welsh mountain, the Herefords may be regarded as the more profitable cattle.

Fig. 12.—ORNAMENTS FOR BUILDING.

there is some want of elegance in the style, there is neatness, solidity, and reality, which, with the economy of the plan, render it very desirable where cheapness and durability are essential. The plans here given, are intended to apply to the building of the class of houses described and illustrated in the *American Agriculturist*, of July, 1873, page 252; although it is adapted equally well to construction of much larger and more costly houses, as well as stables, barns, and outhouses.

The cost of concrete buildings upon this plan, is less than half the cost of brick, including the cost of the plank, etc., for the molds, one outfit of which will answer for a great

Fig. 14.—ORNAMENTS FOR BUILDING.

many buildings. We know of no plan more suitable than this for the use of village building associations, where a number of houses of a similar size are needed, or for farm houses, which in some districts are built very much after the same pattern. In these cases the saving in cost will be greater in proportion to the number of houses built of the same kind of materials.

Horticulture at the International Exhibition of 1876.

The Horticultural Hall, of which we print an illustration this month, is one of the five principal buildings which the United States Centennial Commission will erect for the accommodation of the International Exhibition of 1876, at Philadelphia. These structures—the Industrial Hall, or main exhibition building, the Machinery Hall, the Horticultural Hall, the Agricultural Hall, and the Art Gallery—will have an aggregate floor-space of about 40 acres; but the Industrial and Machinery Halls have been so designed that they can be enlarged to almost double the capacity originally allowed, should the demands for space require it. The Horticultural Hall has been designed by Mr. H. J. Schwarzmann, under the supervision of the National Horticultural Society. Its materials are glass and iron, its length 310 feet by 160 in width, giving an area of one and a

and the Cold Houses, and at the ends, on the right and left of the entrances, the dining-halls, offices, retiring-rooms, etc. In close proximity to the Horticultural Hall will be a number of subsidiary structures—a Victoria Regia House, Domestic and Tropical Orchard Houses, a

see side by side the full variety of the forest products and fruits of the country, from the firs of the extreme North to the oranges and bananas of Florida, and grapes and other fruits of California. An impression will thus be produced of the fertility of the land, and of the

vast range and diversity of its products, of which few persons have any conception; and the exhibition must be one which, at least in this country, will be without a parallel for extent and completeness. In addition to the strict horticultural display, careful provision will be made in advance for trials of agricultural machinery. At the disposal of the Centennial Commission are 450 acres of land, within the limits of Fairmount Park; and a considerable portion of this, divided into lots of suitable size, will

THE HORTICULTURAL HALL AT THE CENTENNIAL EXHIBITION.

Grapery, and other horticultural structures. The surrounding grounds, including a large tract, which may be extended almost *ad libitum*, will be arranged for out-door planting, which will constitute the larger portion of the horti-

be put into crops, for the purpose of testing the mowers and reapers and other agricultural implements offered for competition. About a year ago a National Horticultural Society was organized for the express purpose of co-operat-

PLAN OF THE HORTICULTURAL GROUNDS.—A, Conservatory; B, Victoria Regia House; C, Domestic Orchard do.; D, Tropical do.; E, Grapery; F, Hot-Beds.

quarter acre. The greater portion of this space is devoted to the Grand Conservatory, which is 227 by 77 feet, and occupies the central portion of the building; there being between it and the outer walls on either side, the Warm

cultural display. We give an illustration of the plan of these grounds. It is purposed to plant, at least a year before the opening of the exhibition, the representative trees of all parts of this Continent. The visitor, it is intended, shall

ing with the Centennial Commission, and its various committees are composed of some of our most active amateur and professional horticulturists. The matter is in good hands, and we may hope to see a fine exhibition in 1876.

Plants Received by Mail.—How to Treat.

A correspondent, "J. H. M.," Coldwater, Mich., writes: "I am a constant reader of the

tings, instead of watering them daily, as when they are growing vigorously, they are not watered for eight or ten days, and then sparingly, until a growth of leaves and shoots appears. If the plants are injured by drying out or by

where its stems may hang over rocks, or trail over banks. There is a white-flowered variety, which is much more rare than the ordinary kind, probably for the reason that it does not produce seed so freely. This pea is an excel-

THE EVERLASTING PEA—(*Lathyrus latifolius*.)

NEW WHITE PANSY—"WHITE TREASURE."

Agriculturist, and wish to inquire how plants should be treated when received by mail."

Plants received by mail, or even by express, are in the majority of cases killed after their arrival by what is believed to be kindness. As they have usually been on a long journey, they are supposed to be hungry, and are at once over-supplied with food, a kindness they have no way of resisting, and can only manifest their opinion of it by sickening or dying outright. This mistaken hospitality is usually manifested in placing the weak and bruised roots in a flower-pot several times too large for them, and deluging the soil in which they are planted by water. This is the general treatment. The proper one for plants received from a distance, particularly if by mail, (when the soil is usually shaken from the root,) is to place them in a pot only large enough to admit the smallest possible portion of soil between the roots and the sides of the pot, then keep them rather dry than otherwise, until signs of new growth begin. Always bear in mind that when the roots or leaves of a plant have been bruised or detached, the vitality of the plant has been lessened, and it requires less food in consequence, and has no need of it until the roots and leaves are in vigor again. When from any cause a plant drops its leaves, hold on the water until it again starts into growth. When the florists cut down their plants for cut-

heating, as sometimes happens, cut the tops back severely, to induce new buds to push.

The Everlasting Pea.

While most persons are well acquainted with the Sweet Pea, a charmingly fragrant and variously colored garden annual, but few seem to know its perennial brother, the so-called Everlasting Pea. Neither the Sweet nor the Everlasting Pea belong to the same genus with our common garden pea, (*Pisum*), but they are, more properly speaking, Vetchlings, (*Lathyrus*), though the difference between the two depends upon points which would only be noticed by a botanist. The best known perennial pea is *Lathyrus latifolius*, a native of Europe; the stems are 6 feet or more long, and broadly winged; the leaves consist of a pair of oval or lanceolate, strongly-veined leaflets, terminated by a branching tendril; the flowers are on stalks longer than the leaves, several in a cluster, large and showy, of a lively purplish-rose color. The plant flowers very freely, being in bloom nearly all summer. If planted where it has room to spread, a single specimen, growing flat upon the ground, is a handsome object; or it may be allowed to run upon a low trellis, or even over brush, and it may be introduced with good effect in a wild part of the grounds

lent plant for cut-flowers for summer bouquets, and is worth growing for that purpose alone. A related species, *L. grandiflorus*, has larger flowers, but only two or three in a cluster. The seeds of the everlasting pea may be sowed in spring, or if they can be obtained early in the fall, and then sown, they will before winter make plants large enough to flower the next year. Well established plants may be multiplied by dividing the roots.

A New White Pansy—"White Treasure."

Among all the varied colors presented by pansies it is not strange that there should be white ones; indeed there are several old named sorts of this color—or rather lack of color, but there are not so many that a new and meretricious white variety is not welcome. "White Treasure" originated with M. J. W. Morris, a florist at Utica, N. Y., who sometime ago sent us specimens of the flowers, and more recently we have been able to inspect entire plants. The strong stocky habit of the plant is its most striking characteristic; it is very short-jointed and large stemmed without the straggling weakness that often makes these plants unsightly; the foliage is of good substance and dense, and stands the sun well; a photograph taken of the bed in August shows a vigor of growth quite

unusual with pansies in hot months. The flowers are well up above the leaves, upon strong stems, and of good shape and texture, perfectly white except a small orange-colored eye. The fringe at the base of the side petals is pure white, and by its different texture from the petals themselves, increases the beauty of the flowers. The flowers from which the drawing was made, were quite an inch and three-fourths across. This variety comes true from seed, which the plant produces freely. Almost every grower of flowers is fond of pansies, and will regard a fine white one with favor, and it will no doubt be a valuable pansy for forcing. After examining specimens of the plant, Messrs. Peter Henderson & Co. secured the whole stock of the seeds of this novelty.

More New Grapes.

For several years there has been but little excitement about new grapes; but this season there are several new ones offered, and we know of still others that are being thoroughly tested before placing them before the public.

THE LADY

is the name of a new white grape, offered by Mr. George W. Campbell, of Delaware, Ohio. We have had an opportunity to test the fruit, and were much pleased with its quality. It is so much better than the Martha that it must entirely supersede that variety; indeed, to those not very critical in their judgment of grapes, this would rank among the best. Mr. C. has been careful to test this variety for five years before bringing it out, and, knowing his long experience with grapes and his caution in forming an opinion, we are quite willing to accept the following, which he writes in a private note: "It has been perfectly healthy, both in vine and fruit. It endured the winter of 1872 and 1873, when the thermometer fell to 32° below zero, uninjured and wholly unprotected, being apparently the hardiest vine I ever had. * * * It ripens earlier than the Hartford, Ives, or any other popular early grape." The Lady is a seedling of the Concord, and ripens two weeks before its parent—and two weeks in the ripening, in many localities, decides between grapes and no grapes. Mr. C. says that upon the old vines the bunch and berry equal those of the Concord in size. The sample sent us was somewhat smaller; color, a pleasing light yellowish green, with a bloom, the berries hanging well to the cluster. Mr. C. states, that it keeps better after being picked, and that the skin, though thin, is more tenacious than that of the Concord, and the fruit consequently bears handling better. The popular taste prefers white grapes, and people will pay a much higher price for a white variety than for dark colored ones of much better quality. Should this, as a white grape, prove the equal of the Concord, as a black variety, Mr. Campbell will be entitled to the thanks of fruit growers for introducing it.

THE BRIDGETON,

is a new variety, offered by Messrs. Chase Brothers & Woodward, of Rochester, N. Y. It is a handsome black variety, grown from the seed of Concord, crossed with Diana Hamburg. These gentlemen say: "It appears to combine the hardiness and rapidity of growth, and vitality of the Concord, with the superior quality and beauty of Diana Hamburg. Having thick, large foliage, it is enabled to withstand the heat of summer, and to escape

mildew, being in perfect health at the close of the growing season, it exhibits extreme hardiness, and successfully endures the cold." The fruit, to judge from the specimen sent us, is one of excellent quality, and we hope to be able to give a report hereafter from personal experience with the vine.

THE WHITEHALL

would seem a misnomer for a black grape, did we not know that it was so called because it originated at Whitehall, N. Y. This is put before the public by Merrell & Coleman, Nurserymen, Geneva, N. Y., who claim for it great earliness, with vigor and hardiness. It ripens at Geneva, from August 20th, to September 1st. The fruit, which has the general appearance of the Isabella, is quite distinct in quality, and has a flavor which has been likened to that of an ox-heart cherry. The bunch sent us impressed us favorably with its merits; a portion of the cluster was left in the box in which it came, and at the time at which we write—the first week in November—the grapes, though shrivelled, show no signs of decay, and are still eatable, which indicates that the Whitehall promises to be a good keeper.

Unhealthy Plants—The Remedy.

BY PETER HENDERSON.

Whenever plants begin to drop their leaves, it is certain that their health has been injured either by over-potting, over-watering, overheating, by too much cold, or by applying such stimulants as guano, or by some other means having destroyed the fine rootlets by which the plant feeds, and induced disease that may lead to death. The case is not usually important enough to call in a "plant doctor," so the amateur begins to treat the patient, and the practice is in all probability not unlike that of many of our household physicians who apply a remedy that increases the disease. Having already destroyed the, so to speak, nutritive organs of the plant, the stomach is gorged with food by applying water, or with medicine, by applying guano or some patent "plant food." Now the remedy is nearly akin to what is a good one when the animal digestion is deranged—give it no more food until it re-acts. We must then, if the roots of the plant have been injured from any of the above named causes, let the soil in which it is potted become nearly dry; then remove the plant from the pot, take the ball of soil in which the roots have been enveloped, and crush it between the hands just enough to allow all the sour outer crust of the ball of earth to be shaken off; then re-pot in rather dry soil (composed of any fresh soil mixed with equal bulk of leaf-mold or street sweepings), using a new flower-pot, or having thoroughly washed the old one, so that the moisture can freely evaporate through the pores. Be careful not to over-feed the sick plant. Let the pot be only large enough to admit of not more than an inch of soil between the pot and ball of roots. After re-potting, give it water enough to settle the soil, and do not apply any more until the plant has begun to grow, unless indeed the atmosphere is so dry that the moisture has entirely evaporated from the soil, then of course water must be given, or the patient may die from the opposite cause—starvation. The danger to be avoided is in all probability that which brought on the sickness, namely: saturation of the soil by too much water. Other causes may induce sick-

ness to plants, such as an escape of gas in the apartment, or smoke from a flue in the greenhouse, but in all cases, when the leaves fall from a plant, withhold water, and if there is reason to believe that the soil has been poisoned by gas, or soddened with moisture, shake it from the roots as before advised, and re-pot in a fresh flower-pot. Many years ago, when I used smoke-flues in my greenhouses, some kindling wood, carelessly thrown on the top of one of them, ignited, and the smoke caused the leaves of every plant to drop. There were some 3,000 plants, mostly Tea-Roses, in the greenhouse; it would have been too much of a job to re-pot all, but by withholding water for some ten days, until they started a new growth again, very few plants were injured.

Preserving Flowers—Winter Bouquets.

In former articles were described the methods of preserving flowers by fumigating with sulphur and by drying in sand, and it was advised to simply dry the "everlasting" flowers and grasses for future use. To our own taste a bouquet of everlasting flowers, made up in their natural colors, just as they were dried, is a pleasing object, and so is a bouquet of grasses that have been dried in the shade, and which are more to be admired for their grace of form than for their color, although this presents a considerable variety in different shades of green and straw color, according to the age of grasses at the time of collecting them, and the care with which they were dried. Yet many persons are not content with these simple things in their natural state; everlasting flowers with staring colors not their own, and grasses of every hue from bright yellow to black (!) are imported and sold, and persons who have seen these wish to imitate them. Of course tastes differ. Ours is to have bouquets as natural as possible; others wish them quite unlike anything that nature ever made. We do not assert that we are right and others are wrong, but we can assure those who are content to take the everlastings and grasses just as they grow, will save themselves a great deal of trouble. We have had numerous inquiries about

CRYSTALLIZING GRASSES,

and this is perhaps one of the simplest methods of treating them, as they are not given unnatural colors, and if properly done, resemble something in nature; almost every winter we have one or two mornings, when every tree-twig, and every bit of dead grass is hung with ice-crystals, and is resplendent in the rising sun. This effect can be very well imitated by depositing crystals of alum upon the dried grasses. A year or so ago, one of those persons who write upon all possible subjects, and get their articles published in papers which know no better, gave directions for crystalizing grasses which must have disappointed every one who tried it. It was to make a solution of alum in boiling water in a stone jar, and suspend the grasses *above* the solution! Nothing could be more thoroughly absurd than this; the writer could as well expect to satisfy hunger by looking in at the window of a restaurant, as to get alum crystals on grasses in this way. Here was a physical impossibility gravely written out for the guidance of other people. Much of the hack writing for papers is after this style. To deposit alum upon grasses, or to crystallize them as it is called, one should know the principles upon which the operation depends, in order to be able to modify it to meet

different circumstances. One part of alum takes about fifteen parts of cold water to dissolve it—or in a rough way we may say that a pint of cold water will dissolve an ounce of alum—if more alum be added, it will remain undissolved, the water at that temperature can dissolve no more—it is saturated. If we heat the water, its ability to dissolve alum is much increased, and if boiling it will dissolve more than its own weight of alum; the pint of water which when cold could only dissolve a little over an ounce, when boiling will take up over a pound of alum. If this pint, which dissolved a pound of alum, be allowed to cool, the alum will be gradually deposited, until at length there will only remain the ounce it is capable of dissolving when cold. If a strong solution of this kind is cooled, the excess of alum will be deposited rapidly, and in a confused mass, but if we make a hot solution, with only a little more alum than the water will hold when cold, the excess will be deposited slowly, in well-defined crystals, and if a rough substance, like grass, or a bit of string, be placed in the liquid, the crystals will collect upon that in preference to the smooth surface of the glass or stone jar. Then, to have the grasses studded with clear, bright crystals, with well-defined edges, we must use a comparatively weak solution, and allow the deposition to go on slowly. In practice we prefer a solution in the proportion of two ounces of alum to the pint of water, or a pound to the gallon, which is as small a quantity as will cover any considerable bunch of grass. A wide-mouthed stone-jar is the most convenient vessel, and its size and the quantity of liquid must be proportioned to the quantity of grasses to be treated. Tie the grasses in small bunches, and arrange to hang them to sticks laid across the mouth of the jar. Put into the jar a pound of alum, broken fine, and pour over it a gallon of boiling water; stir with a clean stick until dissolved, which will be very soon, and then suspend the grasses in the liquid, and set away where it will not be disturbed. When the liquid is quite cold there may be no appearance of crystals upon the grasses—never mind, wait. The deposit will commence in ten or twelve hours, it may be later, much depends upon the temperature of the room. The beginning will be slow, but all the better, for the brighter will be the crystals. When the grass has a sufficient covering, remove and hang up to drain and dry; slender grasses should have less deposited on them, than stiff ones, as the effect is injured if they appear too heavy. One trial will be worth any amount of description, and if it appears desirable to hasten the process, use a larger proportion of alum.

DYEING GRASSES.

For most colors it is necessary to bleach the grasses, especially if they are decidedly green. To do this, take two teaspoonfuls of bleaching powder, the Chloride of Lime, as it is called in the shops. Wet it and rub out the lumps with a smooth stick, then add water to make a quart. Then add two or three tablespoonfuls of vinegar—it is not possible to be definite, as both the lime and vinegar vary so in strength, but add enough to make the liquid smell distinctly of chlorine; let it stand, and pour off the clear liquid from the sediment, and if any lime floats, it will be necessary to strain the liquid through a cloth. Use glass or earthen ware. Immerse in this the grasses until white, or nearly so; some will not bleach at all, others will do so in a few minutes when they cease to lose color

remove, rinse, and hang in the sun to dry. The colors used for dyeing them are the same as those for

DYEING EVERLASTING FLOWERS.

Ammobium, White Acroclinium, and some few other cultivated everlastings, are already white, as is our native Pearly Everlasting, (see page 381, October last), which is one of the best. With the colored ones, such as the French *immortelles*, some may be dyed as they are, while others must have their natural yellow color removed. This is done by a solution of white castile soap, an ounce and a half shaved fine, and dissolved in a quart of hot water. The flowers are placed in this for a short time, and then rinsed in cold water, repeating the operation if necessary, until they are white. The white flowers may be made to take any desired color, while the others may have their tints brightened or changed by the use of acids and other agents. The white flowers and the bleached grasses, may be dyed with the ordinary materials used for domestic dyeing, such as Brazil wood, with the colors changed by the use of lime, lye, alum, and other mordants, but any result obtained from these ordinary dyes, will be quite unsatisfactory, and as compared with the imported flowers and grasses, be quite lacking in brilliancy; the reason for the superiority of the foreign articles, is that they are treated with aniline dyes, which give a purity and brightness of color, not attainable by any other method. We advise those who wish to experiment with dyeing these things, not to be at the trouble unless they can procure these aniline dyes. The use of these in the pure form, which is usually that of crystals, is troublesome, but they are now put up of all colors by several parties, in both the state of liquid and powder, and sold by druggists for domestic dyeing. All that is required, is to mix the liquid or powder, as the case may be, with hot water, and soak the flowers or bleached grasses in the liquid until sufficiently colored. The dyes put up in this manner, have full directions for their use, and these may be followed, using the white flowers instead of silks or other fabrics there mentioned. A further consideration of this matter must be postponed to another month.

Mr. Ricketts' Hybrid Grapes.

NOTES BY F. R. ELLIOTT.

[A gentleman at Newburgh, N. Y., Mr. J. H. Ricketts, has long been quietly at work in hybridizing our native grapes with the European, and has met with greater success than has attended the efforts of the many others, who have experimented in the same direction. Mr. R. has occasionally exhibited some of his new varieties, and we have had occasion to test the high quality of a number of them. This fall we had an invitation from Mr. R. to visit and examine his grapes, but were unable to accept it. Knowing that Mr. Elliott was intending to inspect the vines, we requested him to give us notes of the more prominent varieties, which are here appended. These notes have a special interest for grape growers, from the fact that it is probable that a number of the choicest of these new varieties will soon be placed in the trade. The notes are irregular, being taken as the vines stand in the rows; those of no special promise being omitted.—ED.]

No. 12, B.—Is a round oval black berry, with a blue bloom, and a large bunch, shouldered; its flesh is rich and delicious, without pulp.

No. 24.—Is a small grape, about size of Elsinburgh; black, and may be valued for wine, but too small for market.

No. 22.—Is a large, greenish-white berry; a very large and long bunch; sweet and vinous in quality; but here does not ripen earlier than Isabella. The leaf is thick and large, as well as the wood, and in localities like Cincinnati, or the Missonri vine regions, it must, when introduced, take precedence of all.

No. 72.—Is a medium-sized berry, black, nearly round; very sweet and rich. The leaf is large and thick.

Don Juan.—This is one that the grower has felt should be named, and accordingly he has attached the *Don Juan* to it. I have my doubts of its value equaling some of his others. The berry is about size of Rogers' 15; similar, but deeper in color; is without hard pulp vinous, sparkling, sweet.

No. 1.—Is a black grape, oval-shape, large long bunch; flesh firm, juicy, and sweet; a thick, firm, skin, but not harsh to the taste. The growth of leaf and wood strong.

Clinton, No. 6.—Is a small black grape, much resembling Clinton, which is one of its parents; but it is early in ripening, and very sweet.

No. 207, C.—A peculiar rosy-yellowish color; round in form, with a certain flavor and perfume of the pine apple. It is a strong grower, and to an amateur, will, if ever propagated, be one that he must and will have in his grounds.

No. 12.—Is an oval, black berry, of above medium size; a loose bunch and not large, but the flesh is very sweet and rich.

No. 13.—A whitish-green grape, of medium size; a long bunch; very rich and sweet in its flesh; really one of the best in quality of its color.

No. 14.—This is a peculiar large greenish-white grape, equal to "White Tokay," which is one of its parents. The bunch is very large and shouldered; leaf thick and strong, and so is the wood.

Quassaick.—This is another of those Mr. Ricketts has thought deserved a name. The bunch is large and long, and shouldered; the berry is medium or above, roundish-oval in form, black, with a blue bloom; flesh rich, juicy, and sweet; free from pulp. The vine strong, with a large thick leaf; a great bearer.

No. 97.—A very large, round, black grape, with a peculiar rich, juicy, sweet, flesh. It is one of good promise.

Advance.—This Mr. Ricketts has named, and it is certainly so much in advance of any hardy grape yet in our fruit-books, that he perhaps has rightly hit upon the name. It is a large roundish-oval, black berry, a large bunch, and in quality of flesh it is hard to find its superior. Nothing yet grown out of doors in garden or vineyard equals it.

No. 10.—Is a large, oval rounded, reddish-purple grape, in quality surpassing the "Purple Damascus." It is a strong grower, good bearer, and healthy in foliage.

No. 19.—A small black grape; so rich for wine as to go to 109° of saccharometer. For that alone it may be valued.

The Moonwort Ferns.

Most persons, even those who do not study plants, recognize ferns at sight, their habit and general appearance is such that the plants are readily known as belonging to the fern family.

There are some among our native ferns so unlike the majority, that they are likely to be overlooked by those who do not give especial attention to plants, and to be passed by as belonging to some other family. The Moonwort ferns are usually very puzzling, as they have much more succulent fronds than most others, and the reproductive organs, the spores, instead of being placed, as is most commonly the case, in dots upon the back of the frond, are collected by themselves in a sort of panicle, which is really a part of the frond so changed by bearing the spore cases, as to look quite unlike the fertile portion. The botanical name for this genus of ferns is *Botrychium*, which is from the Greek word for a cluster of grapes, to which the fertile portion of the frond bears some resemblance. There are about five species in our Northern States, some of which are rare, but one or two quite common in rich woods. They have clustered fleshy roots from which arise a single frond, one-half of which is sterile, light green, leaf-like, spreading, and usually much divided, while the sterile portion is erect and changed in appearance; the engraving shows the two parts of the natural size; in all the other species the sterile frond is sessile, or attached directly to the common stalk, but in this (*B. lunarioides*), it has a sort of petiole or leaf-stalk. This species varies considerably, and the large engraving shows what is called the variety *obliquum*, and the smaller one a portion of the variety *dissectum*. The other species will be recognized as belonging to the Moonworts, from their general resemblance to this. They are called Moonworts, because in one species, very rare in this country, but common in Europe, the divisions of the sterile frond are shaped like a half-moon. The Moonworts are usually to be found in July or later, and those who take them up with a view to cultivate them, are likely to be much disappointed to find that in spite of all care that may be given them, they soon die. We have on more than one occasion informed our readers of the fact, that the majority of our native ferns are deciduous, lasting only during the summer season. Those sold by the florists, are for the most part evergreens, and those who undertake to cultivate native ferns without

few native species with evergreen fronds, may be cultivated in pots, but for the rest, they should be planted in the open ground, generally all the better if on a rockwork, with the knowl-

in every direction by light colored lines, which run together and form a fine net-work all over the surface; this appearance is apparently produced by a breaking up of the skin of the fruit, and showing a lower lighter colored layer through the cracks. This is so unlike an ordinary cucumber in appearance, as to deceive some experienced horticulturalists, who were quite unable to say what fruit it was. Great hardiness and productiveness are claimed for this variety, and it would be worth growing in the garden as a curiosity, were it not, as it is said to be, of good quality for the table.

MOONWORT FERNS—VARIETIES OF *Botrychium lunarioides*.

edge that their beautiful forms can only be enjoyed during the season of growth, and that they, like other herbs, will sooner or later go into winter quarters. The Moonworts are very desirable in an out-door fernery, as their habit offers a strong contrast to other genera, and they are of the easiest culture, only requiring that they shall not be put in too dry a place, where their roots will be injured by drouth, while they are dormant. In Europe, our native species are valued by fern growers, and they also have species from Ceylon and New Holland, all of which are deciduous like ours, and writers on fern-growing, state that when grown in pots, these too will fail if the roots are allowed to become too dry while dormant.

The Russian Netted Cucumber.

Last spring Messrs. Briggs & Brother, of Rochester, N. Y., sent us, among other novelties, the seeds of the Russian Netted Cucumber. By some oversight these seeds were omitted at sowing time, and we were unable to see the fruit until this fall, when we received a specimen from Messrs. B. K. Bliss & Sons. According to the English seedsmen, this is from the Ukraine country, and was first brought to notice at the Vienna Exposition, where it attracted much attention. The engraving shows the general shape, though some specimens are longer in proportion than this; the skin is of a dark brown color, and intersected

RUSSIAN NETTED CUCUMBER.

knowing this, are apt to attribute their want of success to anything but the right cause. A

A Rustic Porch.

The custom of building ample verandas to houses, even to those of quite moderate cost, is now, we are glad to say, quite common. Still houses, even modern ones, are to be seen, especially in the country, without this most necessary appendage. Nothing can be more inhospitable in appearance than a house without a porch, or stoop, to shelter one from the sun or rain while waiting for the door to be opened. If one is so unfortunate as to occupy one of these desolate-looking porchless houses, there is nothing he can do that will so much improve its appearance as to put a veranda to it, or if he does not care to do that, a simple porch over the door will do much to relieve its nakedness. A porch built of simple style will pay in the comfort it will bring, if one is to occupy the house but a single season. Some time ago one of our associates brought us a sketch of a rustic porch, which some one had put over the door of a very plain cottage, with the effect of changing the whole aspect of the exterior. The engraving shows how this particular porch was constructed, and will serve as a hint for making a tasteful shelter out of very common materials, and there is nothing about it which one of very moderate mechanical skill might not undertake. If red cedar can be obtained, it is preferable for rustic-work of this kind, but other materials will answer if cedar is not at hand. A porch of this kind, when well covered with vines, will, in many cases, be in much better keeping with the

A RUSTIC PORCH.

house, than one made of regular carpentry and costing a much larger sum.

THE HOUSEHOLD.

(For other Household Items, see "Basket" pages).

"Always Handy."

The Fair of the American Institute, which closed last month, besides giving a grand display of large and important machines, had in one of its departments a regular museum of household contrivances. Here were gathered numerous little "crinkums" or "Yankee notions," for facilitating the work of the housekeeper, and among them was a set of articles made by the American Manufacturing Co.,

STOVE WITH "ALWAYS HANDY" ATTACHMENTS.

New Haven, Conn., with the attractive trade mark of "Always Handy." These affairs are attachments to a cooking stove, and are intended to increase its capacity for usefulness. They consist of shelves of light open work casting, upon a support made fast to the stovepipe, and which can be placed at any height or swung to any position; the shelves, as may be seen in the engraving, are in pairs, and may be had in single sets of two, or double sets of four shelves. The agent wished us to try this fixture, and it was put upon the stove, where it is likely to remain; being sufficiently high to be out of the way of the pots and saucepans, the shelves are exceedingly handy; they will hold dishes while taking up dinner, afford an excellent place on which to keep dishes warm, they are just the place on which to set bread to rise, or to dry various articles; indeed it is not easy to enumerate the uses to which they may be put. Another contrivance is a towel rack or dryer, consisting of two or four neat walnut or maple rods, so hung at one end as to be turned in any direction, and if need be, taken away altogether in a few seconds; the racks may be attached to the stovepipe, or with a slight modification, may be hung wherever needed. Both the shelves and the towel rack can go upon the same pipe. The manner in which these articles are fixed to the pipe, is simple and effective; a flexible strip of hoop iron has its ends brought together by means of a screw-clamp, which allows of its ready adjustment to a pipe of any size or shape. Though simple affairs, much ingenuity has been expended in rendering them neat, tasteful, and perfect of their kind.

About Condensed Milk.—If Faith Rochester will visit Wassaic, Dutchess Co., N. Y., on the Harlem Railroad, 82 miles from New York, she can see "the process of condensing milk," and

learn that the plain condensed milk, which is sent to the New York market, has no sugar added to it—none at all. It is simply pure milk with the water extracted—this and nothing more. The sugared milk, put up in cans for distant markets and long preservation, is quite a different thing; this has pure sugar added, and nothing else. The process of doing this can be seen at Brewster's, on the Harlem Railroad, 52 miles from New York, and also at Amenia. All these places and factories are well worth a visit.

W. J. M.

A Folding Rural Chair.

In the household department we have now and then suggested work, which did not properly belong to the housekeeper herself. There are numerous articles of household convenience or ornament, which add much to the comfort of the home, and which can be home-made, such as tables, chairs, wood-boxes, and numerous other things, of which our pages in past volumes bear numerous illustrations. If the good housewife has a definite idea of what she wishes made, she has already taken a good step towards having it, and if she can not make the article herself, she can usually find willing and stronger hands to embody her idea in wood or other material. There is really no reason why ladies should not use the saw and hammer themselves; we have known them to do it, and exceedingly neat work they made. Every well appointed farm should have a workshop with the ordinary tools, and mothers should encourage the boys to work in it. Much of what passes for laziness in boys is really timidity and want of motive, and if the mother or older sister can direct such boys, and make them feel that they are doing something that will be of real use, their independence will give place to zeal, and they will take pride in the work. At the outset, the mother or sister should properly consider their design, whether it is to be a simple box or a more elaborate chair, and have the parts accurately measured; unless this is done, a good job can not be expected, and where

boys are to be the workmen, it is of great importance that they be taught to always work to measure. These remarks are not made with especial reference to the design for a chair here given, but apply to such things as have been suggested heretofore, or may be given hereafter. The folding chair is one that is not difficult to make, and is especially useful on the veranda or where a seat is required in the garden. It is intended to be rustic, *i. e.*, made of wood with the bark adhering to it.

In constructing a chair of this kind, the four principal sticks should be selected that naturally have the desired curves; this seems a difficult matter, but those who have had any experience in

A FOLDING CHAIR.

rustic work, soon learn to see the capabilities of what appears to be unpromising material, and a brush heap is to them filled with useful forms. The wood should be cut at this season, in order that the bark may adhere firmly, and it should be well seasoned. In the lack of sticks with the natural curve, straight ones may be steamed and bent into shape. The pieces should be of oak or hickory or other strong wood, and at least two

inches in diameter at the lower ends. The cross bars are morticed into the side pieces and wedged firmly, and the seat and back made of split pieces firmly nailed on. The two parts are fastened together with carriage bolts. When finished the wood is thoroughly coated with linseed oil. A chair like this will last for many years if put away during the winter; the ability to fold it allows it to be stored in a very small space.

Home Topics.

BY FAITH ROCHESTER.

JENNIE JUNE'S AMERICAN COOKING BOOK.

This book is doubtless familiar to many "to whom these presents may come." Others, who are interested in recipes, may like to hear something about it. I was glad to see the volume at last, exchanging for a little while my copy of Marion Harland's "Common Sense in the Household" with a new neighbor, who had Jennie June's book. In some respects this may be the better book. I fancy that its author understands more clearly than Marion Harland the connection between cooking and health. Both books contain much interesting matter upon general subjects relating to domestic economy. This edition of "American Cookery" was published in 1869; and I am not aware of any later one. In a preface to the new edition the author acknowledges what she believes was an error in a previous edition. She now believes that it is a mistake to dilute cow's milk for infant's food. She thinks it better to sweeten the whole milk very slightly, and warm it by placing the bottle in water, which should be gradually heated. She says that the child is "better nourished on a smaller quantity of fluid and is less liable to flatulence and colic." Those who have young babes to bring up "by hand," will do well to experiment a little in regard to diluting the milk. Physicians have almost unanimously agreed that the milk should have from one-fifth to one-half of water added, but many mothers have thought that their own experience proved the contrary. Remember that it is not our chief object to *fatten* our children, but to give them such elements of nutrition as will produce a steady natural growth, and keep them contented and good-natured and free from disease. Jennie June also recommends prepared barley as a food for infants.

This edition contains an added chapter of Sorosis recipes, and Favorite Dishes of Distinguished Persons. We are told that President Grant is very fond of scrambled eggs and fried ham; while Anna Diekenson "detests everything fried—fried potatoes, fried eggs, or fried mush—while fried beefsteak, such as housekeepers in the West are often heathenish enough to serve strangers, has power to drive her to pull her hair out of curl."

Alas! But why say "housekeepers in the West"? No, I thank you! I do not wish for any of Olive Logan's veal cutlets in curl papers, though she is welcome to cut note paper into heart shapes, oil it, and place her cutlets in it, to make believe they have been fried together, if time hangs heavy on her hands or if she needs such amusement. In fact, this chapter may be a little silly, but the book is a good one, as recipe books go.

In a chapter on "General Principles of Cooking," the author says that the object of cooking is to make food healthful and palatable; that the best food requires the simplest preparation; that cleanliness is the first cardinal principle; that the general rule is to cook long and slowly; that the flesh of grown animals is more healthful than the flesh of quite young ones; that fresh meats are always better than salted or smoked meats; that "the natural order in cooking meats is first to broil, second to boil, third to roast, fourth to stew, fifth to bake, and sixth to fry—and never to fry so long as there is another method left;" that to retain the juices of meat, strong heat should be suddenly applied, so as to close the pores at once, but to extract the juices, as for soup or broth, heat up gradually; that the distinct flavor of each article of food should be retained, for mixtures which make all

dishes taste alike are dyspepsia-breeding as well as appetite-killing; and that food for the well is better than physician for the sick.

NEW FASHIONS FOR WOMEN.

They say that our fashions for feminine garments have long sprung from a very impure source, hence they have been senseless and demoralizing in every way. The fast women of France have led us long enough, and a new era has already begun. Few women, comparatively, have any idea of the excellent work for humanity that the women's clubs are doing. They seem to have the real welfare of women at heart, and have entered earnestly upon a practical work of the utmost importance—dress-reform! In Boston and in New York, and in some other cities East and West, the women of the best intellectual culture and social standing, authors, artists, physicians, teachers, lecturers, and wives of eminent men, have set to work to invent the most healthful and comfortable articles of dress for women, and to secure their adoption. The ignorance of women generally, of the first principles of healthy living, stands chiefly in the way; so lectures on physiology, with special reference to dress, are to be given free to women and to school-girls. By and by, we are to have tracts upon the subject scattered through the country. The Dress Committee of the New England Women's Club seek to make the changes in woman's dress as unobtrusive as possible. They begin with the under-garments. Those of the old style, which they utterly condemn, are the chemise and the corset. Those they entirely abandon. The principles which they attempt to carry out are these—perfectly free action for the vital organs, thus abolishing all tight-fitting waists and all tight bands around the waist; an equalizing of the heat of garments over the entire body, thus lessening the amount of cloth worn over the lower part of the body, and increasing it upon legs and arms; a reduction of the weight of the clothing by making skirts as few and light as possible; the supporting of all clothing from the shoulders, by attaching skirts to waists or suspenders.

The garments already devised, which embody these principles, are the Chemiloon and the Gabrielle underskirt. The first is made of flannel or cotton, a long-sleeved waist and drawers in one, covering the person from waist to ankles. Outer drawers may be buttoned to these. The stockings drawn over the long drawers fitting at the ankle, are fastened with safety pins or with buttons on the drawers. No garters are allowed, because these hinder the circulation of the blood. The Gabrielle underskirt is made of white cotton usually, gored from shoulder to hem, after the plain gabielle pattern rather loosely fitting, and sufficiently short and scant. The outer skirts button upon it, so arranged that one band does not lie over another. If a hoop is worn, (and this is recommended, as it keeps the folds of the skirts from clogging the limbs in walking, and holds the tops of the other skirts so as to prevent undue heating of the pelvis and spine) there should be a stout button hole in the middle of the back of the hoop-band, to fasten upon a strong button on the back seam of the underskirt waist. On each side of this button-hole place the buttons for holding common suspenders, placing the front buttons just over the firm side terminations of the upper hoops. This brings the suspenders back under the the arms, so that they do not interfere with the bust. The balmoreal may rest upon this hoop, with a binding made in semicircular shape, so as to lie upon the skeleton below its binding.

For outer dress the plain gabielle pattern is recommended, not too full in the skirt, and lightly trimmed if trimmed at all. This for the house dress; and an added polonaise or overskirt and short sack for the street.

Thus do the educated American women advise us to dress, and their recommendations are worthy of good heed. In cold weather more than one pair of chemiloons at a time is advised, one perhaps of flannel and one of cotton, or two of wool if more comfortable. All hail the chemiloon! say I, and I suppose that I am not the only obscure

woman, who quietly discarded one of the garments, utterly condemned by the N. E. Woman's Club long ago, for long-sleeved and high-necked shirts, and who never has worn the other instrument of torture.

WARMED-OVER POTATOES

Because only a few potatoes were left from dinner, that is no reason why they should be thrown in the cow's pail. Peel them if not done already, and bake them over in the oven. Or slice them and warm them with bread—which is even better than potatoes warmed alone. This is the way. Put bread crumbs soaking in milk upon the stove. When hot add the sliced or chopped potatoes with salt, and stir all well together till thoroughly heated or cooked. Then season as you wish with a little butter or cream.

THICKENING.

It makes a deal of difference with your cooking, how you stir up sauce thickening for gravy or pudding. You use flour or starch of some kind, mixed with water or milk. Wet the flour with very little water or milk, and beat thoroughly together till every lump disappears, then thin with more water or milk and beat well again. Let the milk or whatever is to be thickened, be actually boiling, and stir as fast as possible while you slowly add the thickening, beating rapidly for two or three minutes. This makes the gravy or custard wonderfully light and foamy, especially if there are beaten eggs in the compound. If you try to mix a little flour with a good deal of water, you will have a long hard siege in getting out the lumps. Salt should be added before the thickening goes in.

THE USE OF DRY YEAST.—Some excellent kinds of dry yeast may be purchased at our groceries. I said once that these cakes were so slow in rising if mixed at once with the sponge that they were chiefly useful for raising new yeast. Not long afterwards I found that this slowness to rise (or to start to rise) gave them great value for summer use, when it seemed desirable, as it usually does, to do the baking early in the morning. Bakers' yeast, or any kind of quick, soft yeast, is so apt to sour before morning on a hot summer night, that a slower kind of yeast is often preferable. I have found it perfectly safe to mix my bread sponge before dark in summer, stirring in the yeast-cake as soon as it was soaked soft in a little warm water, and have never had bread mixed with this yeast become sour during the night or while waiting for me in the morning. I am confident that I know sour dough when I smell it or taste it, as many house-keepers certainly do not. Else why do they make sour bread week after week, year in and year out? Or why do they persist in regularly putting in soda as a necessary step in the process of bread-making?

Those who make dry yeast for themselves should be very careful not to let it get sour while drying. It should be dried rapidly in a good, cool, drying wind. It is unsafe to dry it in the sunshine or by the stove, lest it may sour from excess of heat. It should be mixed with a good deal of corn-meal, and then made into small thin cakes, or—better still, I think—dropped in small crumbs upon a board to dry. Any kind of good, lively, soft yeast may be mixed with meal and make dry yeast. In winter it is best to put the dry yeast, soaked in warm water, rising in a bowl of flour and warm water batter three hours before setting the sponge.

Homes and How to Make Them.

The above is the attractive title of a work by E. C. Gardener, and published in elegant form by J. R. Osgood & Co. This is not, strictly speaking, an architectural work, though it has much to say about architecture; it is a series of letters from persons about to build houses of their own, to their friend, who is an architect, and the architect's replies. The correspondence is bright and pointed, and on the one side shows the difficulties and doubts besetting the intending builder, and on the other the

removal of these troubles by advice and suggestions. The book is characterized by great common sense, and if one contemplates building a new, or remodeling an old house, the perusal of this work will afford many useful hints, and set the thoughts of the reader in the right direction. An extract or two from the book will give an idea of its style, and perhaps be of use in themselves. The author pleads for

ABUNDANT SUNSHINE;

for plenty of windows in the first place, and then their freedom from obstruction by blinds and shutters. We have been long in doubt if carpets have not, on the whole, done quite as much harm as good. A few years ago we visited a house, the lady of which had long been noted for the number and beauty of her window plants; on the occasion referred to, after asking about the rest of the household, we inquired as to the plants; the lady apologetically told us that a few months ago they had newly carpeted their rooms, and not wishing to fade the carpets by the light necessary for the plants, these were given up. Here, instead of a cheerful parlor, with its windows filled with plants, the natural flowers were banished, and shutters closed, all that the miserable caricatures of flowers in a carpet might not lose any of their unnatural brightness. Our author pleads for sunlight, not for plants, but for the comfort and well-being of the household. He says: "Let your doors and windows be wide, and your roof be high. A wide door is far more convenient than a narrow one, usually much better in appearance; and for the windows—when shall we learn the unspeakable worth of the bountiful light of heaven? Does Mrs. John complain that the sunlight will fade her carpets? Let them fade, and know of a truth that all the colors of all the carpets of all the looms that ever throbbed, are not worth to the civilized mortals who tread the dust-containing fabrics, one single hour of unobstructed sunshine. Is it that our deeds are evil that we seem to love darkness rather than light or is it through our ignorant exclusion of this glorious gift 'offspring of heaven first born,' that we are left to wander in so many darksome ways? Be generous did I say? rather try to be just to yourself."—In his advice to build the roof high, the author has in mind that which modern architecture ignores. To our notion the children of the present day are deprived of one of their choicest rights. How can a child ever look back with pleasure upon its early home if it had no garret? Writers lament that there are no children nowadays, that there is no intermediate state between infancy and young ladies and gentlemen. An evolutionist would, we think, have little difficulty in tracing this precocity to

HOUSES WITHOUT GARRETS.

Here is what the author of "Homes and how to make them," says: "You will lose too, under the flat roof, the roomy garret of the old high-roofed houses. These have for me a wonderful fascination. Whether the rain upon the shingles, the mingled fragrance of seeds and drying herbs, the surprising bigness of the chimney, the mysteries hidden in the worm-eaten chests, the almost saintly charm of long-unused spinning-wheels, crumbling mementoes of the patient industry of former generations, or the shine of the stars through the chinks in the shrunken boards, the old garret and all its associations, are among the 'long, long thoughts.' I sometimes doubt whether the modern conveniences we are so fond of proclaiming, are really an equivalent to the rising generation for this happiest of play-rooms, this store-house of heir-looms, this silent but potent tie that binds us to the life, the labor, and the love of the past. Let there be light too in this upper story. Spinning spiders and stinging wasps are not half so terrible to the children who will make a half-way paradise of the garret, as the darkness that is covered by an unlighted roof."—While we have found much to commend in this work, we must express our surprise that the author, who is so generally accurate in treating of ventilation, should speak of carbonic-acid as carbon. This he does more than once, and should hasten to rectify.

BOYS & GIRLS' COLUMNS.

About the Dog Carlo.

BY MARY TREAT.

Carlo was a lost or forsaken dog, and he appealed to my sympathies so strongly, that I begged he might be allowed to remain with us. He was a mongrel, not handsome, yet with a soft, silky coat, and intelligent looking eyes. There was nothing remarkable about him except his strong affection and devotedness, and his love of bright colors, especially scarlet, or any of the bright shades of red. My attention was first drawn to his love of colors, by his seeming admiration of a bed of bright colored flowers, (*Phlox Drummondii*), in which red strongly prevailed. He would stand or lie by these flowers apparently in rapt admiration for a long time together, never stepping on the bed, nor lying on the flowers. The evident pleasure he took in the red flowers, led me to experiment with him, and I found it was only a mass of color that attracted him, a small cluster of flowers he paid no attention to, but a large, bright bouquet, he admired. And it was the same in dress; a red shawl that I sometimes wore, was his special delight, while a red ribbon he paid little or no attention to. When preparing for a walk, he would look at me inquiringly, if I took a black or gray wrapper, he showed no interest, but let me change it for red, and I had his most decided approval, he would gambol and frisk about me, evidently so much more delighted to accompany me, now that I was in this presentable costume!

So little do we comprehend the artistic taste and sagacity of the lower animals, that I might have worn that shawl for a long time, had it not been for the accident of the *Phlox*, and never have known why my dog was so much more sportive and happy at one time in accompanying me in my rambles than at another.

Carlo from the first formed a strong attachment for my pet cat, which was mutual; he often put his paw over her in a caressing way, and she would purr and rub against his legs, and she frequently brought game and placed before him, which he always magnanimously refused!

After a while the cat became mother to two kittens, and for a time they seemed to engross all her attention, and I feared the strong friendship between my pets had ceased, until I saw the cat at her old tricks again; purring about Carlo; but now she seemed to have an object in view, she would rub against his legs and then start off a short distance, looking back as if she expected him to follow, and he did follow a little way, but finally he laid down, as if in despair to comprehend what she wanted. The cat now disappeared, and after a short time returned with one of her pretty, plump kittens in her mouth, and laid it down before him. Upon this Carlo got up and gazed at it with an astonished look, and then ventured to put his nose toward it; this aroused the indignation of the kitten, and it spit and struck at him like a little fury, and Carlo walked away abashed, whereupon the cat brought the kitten to me, seemingly disheartened with her attempt at an introduction to Carlo, who watched me closely while I fondled it, with a jealous look that I never saw manifested toward the mother.

Carlo was on the best of terms with all the dogs of the neighborhood. I am inclined to think he was too much of a coward to attack a dog of his own size, and was too good natured to snarl at one less than himself. When meeting a dog of his acquaintance larger than himself, and sometimes one about his own size, he acted precisely like Mr. Darwin's dog, of which he says:

"I formerly possessed a large dog who was not at all afraid to fight with other dogs; but a wolf-like shepherd dog in the neighborhood, though not ferocious and not so powerful as my dog, had a strange influence over him. When they met on the road my dog would run to meet him, with his tail partly tucked in between his legs and hair not erected; and then he would throw himself on the ground, belly upward. By this action he seemed to say, more plainly than by words: 'Behold, I am your slave.'"

It was next to an impossibility to set Carlo to drive any animal that belonged to the farm, except chickens, he would always drive them from the lawn, and soon learned to do it of his own accord, but never interfering with, nor chasing them outside of the lawn. But he always drove strange cattle or hogs, and if the latter showed fight, he could be quite savage.

One day two small white pigs escaped from their quarters and came on to the lawn, and in vain I urged Carlo to drive them off; he started down to them quick enough, and to my surprise the pigs recognized him as an old friend, and commenced playing with him, and a wild frolic they had. After watching them a while, I scolded, and urged Carlo to drive them off. He would then pretend to try to drive them, barking and frolicking about them, and looking back at me in a comical way, as much as to say, "See, I can't make them go!"

On relating this to one of the family, he informed me that Carlo had a regular frolic every day with the pigs, (which were kept in a large field), and sometimes the old ones joined in the play.

Aunt Sue's Puzzle-Box.

DOUBLE ACROSTIC.

The initials and finals form two cities in the State of Massachusetts.

1. A musical instrument.
2. One of the United States.
3. A tool.
4. A number.
5. A bird.
6. A girl's nickname.

WILLIE WEBSTER.

DIAMOND PUZZLE.

1. Always seen in battle.
2. A unit.
3. A color.
4. A city.
5. A mountain.
6. To mar.
7. A river.
8. Quantity.
9. A quarter of a half.

The center letters, horizontal and perpendicular, form a mountain.

CROSS-WORD.

My first is in heaven but not in earth,
 My next is in value but not in worth,
 My third is in light but not in dark,
 My fourth is in fire but not in spark,
 My fifth is in spring but not in fall,
 My sixth is in boat but not in yawl,
 My seventh is in ink but not in paper,
 My eighth is in candle but not in taper,
 My ninth is in June and also in May,
 My whole is a saint, or so they say.

MOLLY.

SQUARE WORD.

1. A fish.
2. A country.
3. Quiet.
4. A girl's name.

Aunt Sue's Chats.

EFFIE S. W., wants to know the origin of the saying, "robbing Peter to pay Paul." In the time of King Edward the Sixth, of England, his ministers and courtiers appropriated a large part of the lands belonging to St. Peter's church, at Westminster. The people were indignant at the robbery, and to reconcile them, a portion was set apart to pay for repairing St. Paul's church, and so the people talked about robbing Peter to pay Paul, until the phrase became proverbial.

G. W. TOMLINSON.—That is an old joke, "can a man keep his feet dry when he has a creak in his boots?" but I wonder no one has suggested that he should get pmpms.

EMMA.—You may improve the cane-bottom chairs very much, by washing the seats with hot soapsuds and putting them in the air to dry quickly; it whitens and tightens them.

LULU.—I never like to pronounce judgment upon a case without hearing "both sides of the story," and I have not heard your teacher's side; but why keep dwelling on the "thorns that accompany the roses," why not be glad that roses accompany the thorns?

MARY L. BARTLETT wants to know "If lobster's claws really grow again after they are broken off." I don't know, Mary dear, from my own personal observation, but naturalists say they do, and that in three weeks a leg or claw is replaced by one nearly as large and strong as the one lost. In finding out that fact for your edification, I read what astonished me more than the new growth of a lost member, and that was that lobsters like raw oysters for their dinner, and in order to get at them, they watch till the oyster opens its shell, then pop a stone in, so that the oyster can not shut it again. Whereupon the lobster, so this account says, eats the oyster (without pepper or vinegar). I was not astonished at their liking a raw oyster, but at their gumption of getting a stone to wedge open the oyster-shell.

FRANK.—A very neat little "trick," is to tell whether a person holds an odd or even number of pennies (buttons, beans, or what not) in the right or left hand. Give a person an odd number of beans, say nine, eleven, thirteen, or fifteen; tell him to hold an odd number in one hand and an even one in the other; ask him to multiply the contents of the right hand by three, five, seven, nine, or eleven, (always an uneven number,) to multiply those in his left hand by two, four, six, eight, ten, or twelve; let him tell you the product of the whole. Should it be an even number, it proves that the even number is in the right hand; if the sum total be odd, the odd number is in the right hand.

EXAMPLES.

Right hand.	Left hand.	Right hand.	Left hand.
6	9	9	6
3	2	3	2
18	18	27	12
18		12	
36		39	

Instead of one person holding all the beans, they may be divided between two, the performer mentally distinguishing them as right and left; try it.

F. L., asks if I "know any words containing all the vowels." Yes, lots of them. "Abstemiously," and "facetiously," contain the vowels in their proper order. In the following they all occur, but irregularly: Authoritatively, consequentially, disadvantageously, encouragingly, efficaciously, instantaneously, impudently, mendaciously, nefariously, precariously, pertinaciously, sac-

FAMILIARITY ON SHORT ACQUAINTANCE. — Drawn and Engraved for the American Agriculturist

religiously, simultaneously, tenaciously, unintentionally, unobjectionably, unequivocally, undiscoverably, vexatiously, and unquestionably many others.

Making Himself at Home.

Of all animal pets there is none that boys and girls like better than rabbits, especially the white ones. Men who raise rabbits generally like other kinds, such as the monstrous fellows with lop-ears, which make one think that the starch was left out when they were washed, or those from Madagascar or some other far-off country, very expensive, but very ugly. Rabbits are not very intelligent, but they are so tame and so little trouble that all young folks like them. By so little trouble is meant that they are easily taken care of, but if the rabbits happen to get out into the garden, where they can have a frolic of a moonlight night, there will be "trouble" enough in the morning. Many like rabbits that are black, or brown, or of other colors, but none look so nice and clean as the white ones. How long and pretty their ears are; you perhaps think they are only intended as handles by which to lift the animal, but that is not the case; the rabbit has neither claws nor teeth that will do much in fighting, so the animal for its safety depends upon running, and it has its ears so long, for the reason that the wolf in the story told Little Red Ridinghood, "all the better to hear, my dear." Your little pet rabbits can show you one of

the many ways in which the Creator has made animals fitted for the conditions in which they live, and if He did not give the rabbit the power to fight its enemies, He gave it very swift legs, and quick-hearing ears to tell it when to use them. Just look at the beautiful thin ears as the sunlight shines through them, and see the veins and arteries. How funny the little fellows nibble, and how they seem to enjoy eating—indeed that is about all the fun they seem to have. Perhaps you think that the little brown rabbit, that every one of you who has been much in the country knows, is just the same as your pets, only wild; we have no proper rabbit in this country; all those wild ones that are called rabbits, are hares. You would like to know the difference, well, there is not a very great one, the main thing is that hares never make burrows, while the rabbits do. In Europe, where they are wild, they make regular underground villages, or warrens as they are called. Perhaps you do not know that the white rabbits, pink-eyed, you admire so much, are in their wild state gray or some other color, and that your white ones are *albinoes*. You will have to go to the dictionary for that word, unless it is explained here. It often happens that animals that are naturally dark colored, have now and then young that have white hair and pink eyes. White mice, which are sometimes kept as pets, are *albinoes*, and so are white rats; blackbirds, sometimes have *albinoes*, and so do crows, and other birds that are usually dark colored; men and women, even Africans, are sometimes *albinoes*, and have

white silky hair and weak pink eyes. We have said so much about the real rabbits, that the picture is almost forgotten, but there is one curious thing we must tell about one of our wild rabbits, or rather hares: We said that the rabbit was given long ears for its safety; this hare lives far north, where the winters are long and the snow is on the ground for many months. In summer its modest brown coat is so much like the ground, that a prowling wolf or fox could not see it a great way off, but if the animal should run upon the snow, its brown color could be seen at a great distance. Now what do you suppose this hare does? Just as you would do if you wished to hide on the snow, it dresses from top to toe in pure white. It is not right though to say that the hare does it, for the animal could not help itself, but the good Father who cares for even the hares away upon the arctic snows, so made this animal that its coat will change with the season. Isn't that quite as strange as some of the wonder stories? But the picture. We have had a good laugh over it, for the artist has given so much expression to these usually rather stupid animals. Evidently the central dark rabbit is a new comer; when he was put with the rest he seemed to be very bashful, but now he is making himself quite at home, and is getting on the best of terms with the white one. The father of the family is astonished at the impudence of the new comer, and evidently thinks, "Well, this chap is making himself at home." And the fellow at the left, how jealous he looks at the familiar new comer!

Life Insurance.

Among the many considerations which give the subject of life insurance a claim on our attention, is its bearing on the most sacred obligations of humanity. By the decree of Divine Providence, every head of a family is bound to provide for the maintenance of the members of his own household. The husband must support and cherish her who, at the altar, was given his care. The father must provide for the maintenance and education of those who, through him, have received their being. The laws of society require this; the laws of nature suggest it; the laws of religion commend it; the common sentiment of mankind insists upon it.

Every man is bound to secure, as far as lies in his power, the support of those whom he has been instrumental in bringing into the world. Thus, while the father lives, he owes his toil to them. For their sakes, he must be content to "rise up early, and late retire to rest, and eat the bread of carefulness." In all the wide world, there is no one to whom he rightfully can transfer this responsibility; and it is a responsibility which no one, possessed of the true feelings of a man, wishes to be rid of. Toil is sweet when it is performed for those whom one loves, and who, in love, are dependent on his care. But human life hangs by a slender thread. The strong arm of the bread winner is liable at any time to fail those who are dependent upon it for support. The father can have no security that his life shall be prolonged till his helpless flock shall no longer need his labors. Is there no duty laid upon him in view of a contingency of this sort? Is not every household head bound most sacredly to make provision, as far as possible, against the evils which his death might entail on his dependents?

The duty of life insurance is therefore plain. The only question is: Where shall it be obtained? If more than a quarter of a century of honorable dealing; if ample assets, distinguished success, good management, and exceeding popularity—if these are indications, or tests, of the proper company to insure in, the United States Life Insurance Co., of this city, may safely appeal to either, or to all of them.

A YOUTH'S PUBLICATION.—For nearly half a century the *Youth's Companion*, of Boston, has been published. It was started in 1827, and is to-day one of the brightest and most vigorous papers with which we are acquainted.

(CIRCULAR.)

Consumers' Importing Tea Co., No. 8 Church Street, P. O. Box 5,509. New York City.

This is a combination of capitalists to supply the consumers of Teas throughout the United States on the mutual principle.

We have experienced agents in all the best districts of China and Japan to select Teas especially for our trade.

We expect every consumer of Teas to render us all the assistance they can in carrying out our enterprise, as we make a specialty of **SUPPLYING CONSUMERS ONLY** (and allow no middlemen to make any profit on our importations), which will enable us to supply them with Teas at prices lower than have ever been known, and of those fine qualities that seldom reach the interior, being sold only in the large cities and among the very wealthy.

Hoping the consumer will take an interest in our enterprise, and send at once for a circular with full explanations of how to proceed to obtain our goods, we remain,

Most respectfully yours,

Consumers' Importing Tea Co., No. 8 Church Street, P. O. Box 5,509. New York City.

Entered, according to Act of Congress, in January, 1874, by the Consumers' Importing Tea Co., in the Office of the Librarian of Congress, Washington, D. C.

GOOD CROPS Depend on good Seed, good Soil, good culture. So **Good Health** depends on **Right Living,** and the proper observance of the **Laws of Life,** as taught in the **Science of Health.** \$2 a year; or, "On trial" 3 months for 25 cts. Single numbers, 20 cts. Agents wanted. Great Premium Offers. Sewing Machines at Wholesale. **Phrenological Journal,** 3 months, "on trial," for 50 cts. A year, \$3. S. R. WELLS, 389 Broadway, New York.

WICKS

FLOWER AND VEGETABLE GUIDE

No. 1 for 1875

PUBLISHED QUARTERLY.—The January number is just out, and contains over **100** pages, **500** engravings, with descriptions of more than **500** of our best **Flowers**, and of all our leading **Vegetables**, with full and plain **Directions for Culture**.

The Guide is elegantly printed, a model of typographical beauty, on the choicest tinted paper, and the engravings are of the finest character. It is the most useful and beautiful work of the kind in the world.

The other numbers are published in March, June, and August, making a book of over 200 pages, and all for **25 cents a year**, including a beautiful colored lithographed Frontispiece. A German edition published. Address

ARTHUR'S

ILLUSTRATED HOME MAGAZINE.

Bright, Cheerful, Progressive, always up to the advancing thought of the times, the HOME MAGAZINE takes rank with the leading and most influential periodicals of the day.

It is on the side of Temperance and true Christian morality. Whatever is hurtful to Society it condemns without fear or favor, and makes itself felt in the Homes of the People as a power for good.

1875

THE GREAT HOUSEHOLD Magazine of America, is more thoroughly identified with the People in their Home and Social Life than any other periodical in the country.

"DEBORAH NORMAN: HER WORK AND HER REMEDY," A new serial story By T. S. ARTHUR will be commenced in January.

"FIFTY YEARS AGO; OR, THE CABINS OF THE WEST," By ROSSELLA RICE. These papers will be fresh and new, and of unusual interest.

"THE STORY TELLER," This department will be unusually rich. Besides an abundance of Short Stories, two or three serials will be given during the year.

BUTTERICK'S NEWEST PATTERNS for ladies' dresses and children's dresses are given by special arrangement every month.

"THE LION IN LOVE," and **"THE INFANT TERROR,"** two large and splendid premium engravings. One of these is sent free to every subscriber.

\$2.50 a year is the price of "ARTHUR'S ILLUSTRATED HOME MAGAZINE." In clubs; 3 copies for \$6; 6 and one extra to get up of club \$12; 10 and one extra \$20. 15 cents must be added to each subscription for prepayment of postage for the year. Specimen numbers 15 cents, in currency or postage stamps.

Papers are addressed to each name. Either English or German Edition, at these prices.

Light Work and Good Pay FOR DECEMBER. READ OUR Premium List.

New Things, Good Things, Useful Things,

That can be obtained without money and with a little effort by

ANYBODY.

The Publishers of the American Agriculturist present their friends and readers with their Premium List for 1875, full of good things. The experience of many years has taught them that such offers as are here made, of very large returns for a very little labor, never fail to be highly appreciated.

Now, reader, here is something for You. Look over the attractive List of Premiums, which you will find in third column of this page. There are many things among these that you would like to possess without having to pay the money for them. Here are Pocket Microscopes, Gold Pens, Revolving Pencils, Silver-Plated Ware, Knives and Forks, Pocket Knives, Beautiful Toys for the Children, Melodeons, Pianos, Sewing Machines, Knitting Machines, Books, etc., etc., etc. You have only to make your choice, and then take hold of this pleasant work of getting a club of subscribers sufficient to obtain it. More than Fifteen Thousand Men, Women, and Children, in almost all stations and pursuits, have successfully done this, and at least fifteen thousand may do it now. You may as well be one of the fortunate ones, as anybody

else. It only needs a little enterprise and the will—with the will there will be a way. And there can be no better time than now. There is room in every neighborhood for several premium clubs. Everybody ought to have the paper; its plain, practical information will put money in most people's pockets, and save multitudes from swindlers, and from unprofitable investments of funds and time. So while you are aiding to push the paper into the people's hands, you are engaged in "doing Good as well as in Making Money."

The American Agriculturist is one of the best papers to canvass for in the world. Its many beautiful illustrations, its interesting and instructive reading matter, its Household and Boys and Girls' Departments, its intrinsic value in every way, secure hosts of friends wherever it is seen and known. Read five extracts as specimens from many hundreds of persons who have received our Premiums.

"June 1, 1874.

"I am very much pleased with the premiums, [Dictionary and Gun], and could sell them now at a fair price, but can't think of parting with either, although I am not much of a hunter. My watch that I received over two years ago, is an excellent time-keeper. I feel encouraged to do more than ever for the Agriculturist, if I should live next year."

"June 26, 1874.

"Premium [Pocket Rifle] received. Thanks. It is beautiful."

"June 24, 1874.

"Please accept thanks for Carver and Fork, which you sent me as Premium for getting a club to American Agriculturist. I find them as represented—genuine articles."

"October 27, 1874.

"I received the Premium [Braeket Saw] on the 24th. I am very much pleased with it, and will send names for the Premium No. 25."

"October 31, 1874.

"I desire to acknowledge the receipt by to-day's express of your magnificent Premiums, Nos. 2 and 6—a splendid Ice-Pitcher and one dozen Teaspoons—and which I have every reason to believe are fully equal to your representation (the best triple-plate). With thanks for your promptness, I remain yours truly."

Now, what has been done by thousands to their great profit and delight, You too may do. TRY IT.

Explanatory Notes.

N. B.

Read and carefully Note the following Items: (a) All subscribers sent by one person count, though from several different Post-offices. But... (b) Tell us with each name or list of names sent, that it is for a premium... (c) Send the names as fast as obtained, that the subscribers may begin to receive the paper at once. You can have any time you wish up to next July, to complete your list... (d) Send the exact money with each list of names, so that there may be no confusion of money accounts... (e) Old and new subscribers all count in premium clubs, but a portion, at least, should be new names; it is partly to get these that we offer premiums to canvassers... (f) Spe-

cimen Numbers, etc., will be supplied free, as needed by canvassers, but they should be used carefully and economically, and where they will tell... (g) Remit money in Checks on New York Banks or Bankers, payable to order of Orange Judd Company, or send Post-office Money Orders. If neither of these is obtainable, Register Money Letters, affixing stamps both for the postage and registry; put in the money and seal the letter in the presence of the Post-master, and take his receipt for it. Money sent in any of the above ways is at our risk; otherwise it is not.

Table of Premiums.

[In the following table is given the price of each article, and the number of subscribers required to get it free, at the regular rates of \$1.50 a year, and also at the club rates of \$1 a year.] Descriptive List sent Free to applicants.

Table of Premiums and Terms For Volume 34—(1875). BEGINNING NOW. Open to all—No Competition. Table with columns: No., Names of Premium Articles, Price of Premiums, Number of Subscribers required at \$1.50, Number of Subscribers required at \$1.

Every Premium article is new and of the very best manufacture. No charge is made for packing or boxing any article in our Premium List. The Premiums, Nos. 12 to 18, 22 to 26, 29 and 30, 38 to 43, and 59 to 90, inclusive, will each be delivered FREE of all charges, by mail or express (at the Post-office or express office nearest the recipient) to any place in the United States or Territories.—The other articles cost the recipient only the freight after leaving the manufactory of each, by any conveyance desired. See note on "Supplement," next page.

An Illustrated Supplement

containing full descriptions of all our Premiums will be sent *free* to all applicants. We have not room here for the Descriptive List. We ask each of our **Old Readers** to kindly call attention to this fact, and either to raise a club of subscribers, and secure one of these useful and valuable Premiums for himself, or put some friend or neighbor in the way of doing the same. It is

Light Work for Good Pay.

Practical Floriculture.

A Guide to the Successful Propagation and Cultivation of Florists' Plants.

By **PETER HENDERSON,**

Author of "Gardening for Profit."

Beautifully Illustrated. Price, Post-paid, \$1.50.

In this work, which has every where become so deservedly popular, not only is the whole "art and mystery" of propagation explained, but the reader is taught how to plant and grow the plants after they have been propagated. The work is not one for florists and gardeners only, but the amateur's wants are constantly kept in mind, and we have a very complete treatise on the cultivation of flowers under glass, or in the open air, suited to those who grow flowers for pleasure as well as those who make them a matter of trade. The work is characterized by the same radical common sense that marked the author's "Gardening for Profit," and it holds a high place in the estimation of lovers of floriculture. The new edition has been thoroughly revised by the author, and much enlarged by the addition of valuable matter.

The following are a few of the subjects embraced in the latest edition:

Laying out Flower Garden and Lawn; Designs for Grounds and for Greenhouses; Soils for Potting; Cold Frames; Hot-Beds; Greenhouses Attached to Dwellings; Modes of Heating; Propagation of Plants by Seeds and by Cuttings; Culture of the Rose and Tuberoses; Growing of Winter-flowering Plants; Construction of Bouquets, Baskets, etc.; Parlor and Window-Gardening; Wardian-Cases and Ferneries; Insects; What Flowers Grow in the Shade; Culture of Grape-Vines under Glass; The Profits of Floriculture; How to Become a Florist, etc., etc.

Play and Profit IN MY GARDEN.

By **E. P. ROE,**

Author of "Barriers Burned Away," etc.

NOTICES BY THE PRESS.

The author takes us to his garden on the rocky hill-sides in the vicinity of West Point and shows us how out of it, after four years' experience, he evoked a profit of \$1,000, and this while carrying on pastoral and literary labors. . . . It is very rare that so much literary taste and skill are mated to so much agricultural experience and practical good sense. —*Harper's Magazine.*

This book is as poetical as it is practical. Still he is no dreamer. He goes into every essential detail with as much minuteness and precision as if he were writing a manual for the practical farmer. Indeed few works professedly devoted to agriculture give more sound and valuable information on the secret of winning golden harvests from the soil than this brief idyllic sketch. —*N. Y. Tribune.*

A very charming book, not only by reason of its pleasant style, but for its quiet refined humor and fund of really useful information on the subject of gardening. —*Boston Gazette.* It deserves to stand side by side with "My Summer in a Garden." —*Christian Register.*

A fresh, lively work. —*N. Y. Observer.* One reads without weariness and learns much of practical value. —*Chicago Evening Journal.*

Full of information. Explains just what the reader wishes to know. We most heartily commend it. —*Providence Evening Press.*

A chatty, sensible, profitable book. —*Cleveland Herald.* The book gives much valuable information, and gives it in the pleasantest manner imaginable. —*Detroit Daily Union.*

AMERICAN AGRICULTURIST.

PATENT DEPARTMENT.

IMPORTANT TO INVENTORS.

American Agriculturist PATENT DEPARTMENT

In compliance with the request of numerous inventors, we have organized a

PATENT DEPARTMENT

in connection with this office for the transaction of all business connected with

Securing Patents

in the United States and foreign countries. The character for

Reliability

which has been maintained by the AMERICAN AGRICULTURIST for more than thirty years will be carefully guarded in this as in other departments.

All Inventors

desirous of procuring patents at moderate cost are invited to forward (express prepaid) a model of their invention, with a brief description of its working. The model should not exceed one cubic foot in dimension. Upon receipt of model an opinion as to patentability will be given free of charge.

Preliminary Examination

at the Patent Office, to determine patentability, will be promptly made for a fee of \$5.

Litigation of Patents.

The services of the best counsel have been secured to prosecute or protect before the U. S. Courts and the Patent Office the claims of those intrusting their business to this agency.

Specifications, drawings, engravings, models, and all other appliances furnished at moderate prices.

In all dealings with this Department inventors may depend upon promptness, fidelity to their interests, and the best services which can be rendered by thorough experts. For full particulars, address

AMERICAN AGRICULTURIST PATENT DEPARTMENT ORANGE JUDD COMPANY, 245 Broadway, New York.

A. HANCE & SON Nurserymen & Florists,
Red Bank, N. J.

My ANNUAL CATALOGUE of VEGETABLE and FLOWER SEED for 1875, will be sent free to all who apply; customers of last season need not write for it. On my several seed farms I raise one hundred and fifty varieties, and also import from growers in Europe their choicest kinds. In my Catalogue will be found several valuable new varieties of vegetables, I having made this department a specialty for many years. I would particularly invite the patronage of Market Gardeners, and all others who are especially desirous to have their seed pure and fresh, and of the very best strain. All seeds sent out from my establishment are covered by three warrants, as given in my Catalogue.

JAMES J. H. GREGORY, Marblehead, Mass.

DOANE COLLEGE, IN SOUTH PART OF CRETE, NEB.

IF YOU WANT A FARM OR HOME,
 YOU SHOULD BUY OF THE
BURLINGTON AND MISSOURI RIVER RAILROAD CO.
 IN IOWA OR NEBRASKA.)

BECAUSE—Their prices are low, ranging for the best land from Three to Ten Dollars per acre.
BECAUSE—No payments are required of the purchaser for four years, except interest at six per cent.
BECAUSE—After the fourth year only one seventh of the principal is payable annually till the whole is paid.
BECAUSE—You are not required to go into a wilderness, these being well-settled States, the population of which is rapidly increasing.
BECAUSE—The mildness of the climate and fertility of the soil is such that the settler can pay for his farm from the products raised upon it long before the time when the principal becomes due.
BECAUSE—Failure of crops from drouth is unknown.
BECAUSE—Large allowances are made upon fare and freight, thus giving low rates on both to purchasers of this Company's lands.

AND YOU SHOULD BUY THIS YEAR.

BECAUSE—Purchasers of our lands in Nebraska during 1874 who cultivate one-half their land within two years from their purchase are allowed a reduction of twenty per cent on its price. **LARGE DISCOUNTS** also, FOR CASH, within One, Two, or Five Years.

Send for Circulars, with full information on all points, to

THE AMERICAN DAIRY SALT COMPANY,
 SOLE MANUFACTURERS OF THE
ONONDAGA FACTORY FILLED
DAIRY & TABLE SALT,
 AT SYRACUSE, N. Y.,

Respectfully call the attention of Dairymen and others to the quality of the salt now being manufactured by them. Having for many years past been engaged in perfecting the various processes for the manufacture of this salt, and by adopting the best modes and machinery for the purpose, they feel warranted in saying to the consumer that the article now produced is superior to any other either of foreign or domestic production. The following is a correct analysis of our Salt, and also of the celebrated Ashton's English Salt, made by Chas. A. Goessmann, Ph. D., Professor of Chemistry in the Massachusetts Agricultural College at Amherst, Mass:

	Ashton Salt.	Onondaga Factory Filled.
Chloride of Sodium.....	97.45	98.25
Sulphate of Lime.....	1.43	0.91
Sulphate of Magnesia.....	0.05	.06
Chloride of Magnesia.....	0.06	.00
Sulphate of Soda.....	.00	.03
Insoluble matter.....	.05	.12
Water.....	.76	.60
	100.00	100.00

Circulars in regard to various tests made with this salt in comparison with the best foreign article, also certificates from a large number of the best dairies in the State as to its quality, may be had on application to **J. W. BARKER**, Secretary, Syracuse, N. Y., to whom orders for salt may also be addressed.

It is also for sale by the Agents of the Company in principal Western Lake Ports, by **SR. JOHN & AVERY**, 101 & 103 Broad St., New York; **ROBERT GREEN**, 109 Pier, Albany, N. Y., and by Salt Dealers generally throughout the State of New York. Inquire for **Onondaga Factory Filled Dairy Salt**. **J. W. BARKER**, Pres. & Sec'y, Syracuse, N. Y. **THOS. MOLLOY**, Treas.

FANCIER'S JOURNAL A Weekly devoted to **Fowls, Pigeons, Rabbits, Dogs, Song Birds, etc.** Send stamp for Specimen Copy. **JOS. M. WADE**, Philadelphia, Pa.

THE CHRISTIAN ADVOCATE

For 1875.

NOW READY,

MAGNIFICENT PREMIUM ENGRAVING!!!

REV. DANIEL CURRY, D.D., Editor.

REV. W. H. DE PUY, D.D., Assistant Editor.

The Oldest, Most Widely Circulated, and Most Largely Patronized Methodist Weekly Journal in the World.

While it makes no array of lists of contributors, no religious Journal in the country exceeds it in *The Ability of its Editorials, the Ability and Number of its Correspondents, the Variety and Freshness of its News, or the Number or Utility of its Various Departments.*

It is sought for by the children as well as by adults, and abounds in information fresh, attractive, and useful to persons in every vocation of life. Its great merit as a religious family journal is universally conceded. Notwithstanding the great competition on every side, its circulation is constantly increasing, and now extends into every Christian country, and its subscription list is now the largest of any of the great denominational weeklies.

The Publishers take pleasure in announcing their plans for the ensuing year. The present large circulation of *The Christian Advocate* and the prospective increase in the subscription list, will enable us to continue to furnish it in its enlarged form and at the present low price of \$2.50 per year, while the superior quality of the paper and the excellence of the mechanical work upon it will not be diminished in the least. We will also send the paper to new subscribers from the date of receiving their names to January 1, 1876, for the price of a single year's subscription. In other words, new subscribers for 1875, the volume which opens with January next, will receive the paper for the remainder of the present year free of charge.

The Publishers have also arranged to favor every subscriber to *The Christian Advocate* for 1875 with the most meritorious and valuable free Premium ever offered by any religious weekly to all its subscribers. For this purpose they have purchased of that eminent artist, Mr. A. H. Ritchie, his new, original, and magnificent steel engraving, "MERCY KNOCKING AT THE WICKET GATE," (single copies of which sell at \$5 each), and will send a copy free of charge to every subscriber, old and new.

Concerning the real merit of this splendid engraving, and as illustrations of the great favor which it is receiving from the best judges, we quote the following brief paragraphs from highly appreciative notices (many of them lengthily) received by Mr. Ritchie during the last few weeks:

- From Bishop Simpson: "I am much pleased with both its design and its execution."
- From Rev. Dr. E. O. Haven, Chancellor of Syracuse University: "Mercy Knocking at the Wicket Gate" is not only superior as a work of art, and a great credit to its author on that account, but it is of such a character as to make a pleasing impression on the mind, and to be worthy of a permanent place where it will be often seen. It partakes largely of that which makes a thing 'a joy forever.' I congratulate the artist on his success."
- From Rev. Dr. Leonard Bacon, President of Divinity School of Yale College.—"I have rarely found my susceptibilities so touched by any similar work of art as they have been to-day (Sept. 14, 1874.) by your most exquisite engraving of your own most eloquent picture, 'Mercy Knocking at the Wicket Gate.' You may thank God that He, by giving you grace to make that picture, has made you a preacher of the Gospel to all who, seeing it, can feel the lesson that is in it."
- From Rev. Dr. Cummings, President of Wesleyan University: "The engraving, 'Mercy Knocking at the Wicket Gate,' executed by A. H. Ritchie, is a beautiful work of art. No one can look upon it without being pleased and profited."
- From Rev. Dr. Talmage, Brooklyn: "The engraving, 'Mercy Knocking at the Door,' is worth fifty sermons. How any one can look at it without more tears on his cheek than seems, according to the picture, to have fallen on Mercy's cheek, I know not. Thanks, thanks."
- From Rev. Dr. Fowler, President of the North-western University: "Have seen your new engraving, 'Mercy Knocking at the Wicket Gate,' and like the subject and the work."
- From the Western Christian Advocate, Sept. 23: "It will be found an excellent and snitable picture with which to decorate many houses, and to collectors or all who appreciate the progress of native skill it will be valuable. It is a notable addition to American works."
- From Zion's Herald, Sept. 24: "It is an impressive and eloquent picture, full of pathos and spiritual significance. It makes a perpetual sermon upon the wall."
- From the Baptist Weekly, Sept. 24: "It is engraved in the highest style, and makes one of the finest pictures we have ever seen. The moral effect of such a picture in our homes can hardly be estimated. It is a study so fruitful of religious thought, and so tender in its practical suggestions, that the eye can hardly grow weary in gazing upon it, and the heart can never lose the power of its impression."
- From the Brooklyn Daily Argus, Sept. 14: "It is a beautiful parlor piece."
- From the N. Y. Daily Times, Sept. 12: "The beauty and force of Mr. Ritchie's original picture, and the masterly manner in which he treated this pretty episode from Pilgrim's Progress, were well described at the time, with, we believe, the unanimous accord of the critics. We have only to say that the engraving on steel does full justice to the original, and that it has been completed in the best style of the art."
- From the Sunday-School Times, Philadelphia, Oct. 10: "Mr. Ritchie's new engraving is a beautiful study, executed with rare skill. It is large in size, and exquisite in tone and finish. . . . Lovers of art will be glad to see this picture multiplied. It will find favor in many homes where a critical taste challenges every new introduction."

As under the new postal law publishers must prepay postage, subscribers must remit twenty cents additional for postage. All pastors in the Methodist Episcopal Church are our Agents, and subscriptions for the paper and orders for premiums may be forwarded through them. When agents order premiums for the supply of their localities at one time, we send by express free of charge. When premiums are ordered to be sent by mail, ten cents must be remitted for prepayment of postage.

 to sell the **NEW BOOK TELL IT ALL**
 By Mrs. Stenhouse of Salt Lake City, for 25 years the wife of a Mormon High Priest. Introduction by Mrs. Stowe. This story of a woman's experience lays bare the "hidden life," mysteries, secret doings, etc. of the Mormons as a "wide awake woman sees them." Bright, Pure and Good, it is the best new book out, actually overflowing with good things for all. It is popular everywhere, with everybody, and outsells all other books three to one. Ministers say "God speed it." Eminent women endorse it. Everybody wants it; and agents are selling from 10 to 20 a day! 25th thousand now in press! We want 5,000 more trusty agents NOW—men or women—and we will mail outfit free to those who will canvass. Large pamphlets with full particulars, extra terms, etc. sent *gratis* to anyone. Address **A. D. WORTHINGTON & Co.,** Hartford, Conn.

GOOD NEWS for book agents, and others desiring employment. New books by popular authors, **LITTLE FOLKS IN FEATHERS AND FUR** by OLIVE THORNE, and **THE WAYS OF WOMEN**, by Dr. J. V. C. SMITH. Splendidly gotten up. Beautifully illustrated. Nothing equal to them now offered to agents. **THE LIFE AND ADVENTURES OF KIT CARSON** is still selling rapidly. Over 20,000 already sold. \$50 a week easily made. **STOWE'S SELF-INTERPRETING FAMILY BIBLE**, the finest in the world. Circulars giving full and complete information sent free. Mention the books wanted. Address, **DUSTIN, GILMAN & CO.,** Hartford, Conn.

AGENTS WANTED FOR GUIZOT'S HISTORY OF FRANCE, 400 Magnificent Illustrations.
ESTES & LAURIAT, 143 Washington St., Boston.
 WE take pleasure in announcing that we have just received news of the fact that the great Statesman, and Historian, had just completed this important work before his death. The MS. of the last vol. being now in the hands of the Paris publishers. We are now issuing the work in semi-monthly parts, at 50 cts. per part. It is one of the most superb specimens of book making ever published in America. First class canvassing agents wanted in every part of the country. It is the **GREAT BOOK** of the year. Apply at once to

HOMES AND HOW TO MAKE THEM.
 By **E. C. GARDNER,** Illustrated. \$2.00.
 "It is a treatise on house building. So much good sense and good taste on this all-important subject are not often, to our thinking, embraced within an equal compass. Whether the reader is going to build or not, he will enjoy it vastly; and if he is, he should give it his most diligent attention."—*The Congregationalist* (Boston).
 "There is hardly a matter connected with the work of building a 'home' which is not treated of wisely and well, from the choice of a site or the adaptation of a building to a site, through all the stages, from the drains and foundation walls to the modest completed building—strong but beautiful; tasteful but not merely ornamental; a little earthly paradise but yet not too grand for every-day enjoyment or use."—*Christian Intelligencer*.
 "An exceedingly sensible book, and written so entertainingly that reading it is a pleasure."—*Hartford Courant*.
 ** For sale by Booksellers. Sent, post-paid, on receipt of price, by the Publishers,
JAMES R. OSCOOD & CO., Boston.

Every **FARMER** and **STOCK RAISER**, and **EVERYBODY** that keeps a **HORSE**, a **COW**, **POULTRY**, **SHEEP** or **SWINE**—whether he lives in **CITY**, **TOWN**, or **COUNTRY**, wants the

FRAMES FOR THE CHROMOS.

We have made arrangements to supply frames to our subscribers who may desire them for the Chromos which we have distributed. Many will no doubt avail themselves of this opportunity to place these beautiful pictures in handsome frames at moderate cost.

- For the Chromo, "UP FOR REPAIRS," Or for the Chromo, "LOOK OUT!" Letter A. Neat Black-Walnut Frame, Gilt Band... Letter D. Full Gilt Frame, 2 inches wide... For the Chromo, "MISCHIEF BREWING."

Address orders, specifying by its letter or number the frame desired, and inclosing price, as above, to the ORANGE JUDD COMPANY, 245 BROADWAY, NEW YORK.

The Cultivation of the Willow or Osier, By WILLIAM SCALING, Ten Years Basket Maker to Her Majesty and the Royal Family. This little pamphlet, though written by an Englishman, and of course designed especially for cultivators among his countrymen, contains just those practical instructions for the planting and culture of the willow, which many among us will be glad to receive.

Advertisement for 'AMERICAN AGRICULTURIST' featuring a decorative border, the text 'SUBSCRIBE NOW FOR THE AMERICAN AGRICULTURIST', and details about subscription prices and the 'Chromo' feature.

CHICAGO & NORTH-WESTERN RY. THE TRANS-CONTINENTAL ROUTE.

This is the Pioneer line between Chicago and the Pacific
Coast, and was the first to connect with the great Pacific
roads, and form the OVERLAND ROUTE. This line is
the shortest rail line between Chicago and Omaha; the track
is of the best steel rail, and is well ballasted, and as free
from dust as a road can be made; the bridges are strong
and durable; and all the appointments are first-class in
every respect. The trains that run over this line are made
up of elegant new Pullman Palace Drawing Room and
Sleeping Coaches built expressly for this line, luxurious,
well lighted and well ventilated Day Coaches, and pleasant
lounging and smoking cars; all built by this Company in
their own shops. The cars are all equipped with the cele-
brated Miller Safety Platform, and patent Buffers and Coup-
plings, Westinghouse Safety Air Brakes, and every other ap-
pliance that has been devised for the safety of passenger
trains. All trains are run by telegraph. In a word, this
GREAT CALIFORNIA LINE has the best and smoothest
track, and the most elegant and comfortable equipment of
any road in the West; and has no superior in the country.
It is eminently the favorite route with Chicagoans traveling
west, and is acknowledged by the traveling public to be the
popular line for all points in Western Iowa, Nebraska, Wy-
oming, Colorado, Utah, Montana, Idaho, Nevada, Califor-
nia, and the Pacific Slope.

All Coupon Ticket Agents sell tickets by this route. If
you are going West, you should try this route.

Gardening for Profit.

A Guide to the Successful Cultivation of
the Market and Family Garden.

By PETER HENDERSON.

Finely Illustrated. Price, Post-paid, \$1.50.

The following voluntary notice of this book comes from
a Western market gardener and shipper of vegetables, and
is a specimen of similar testimony from very many quarters.

March 23d, 1874.

"If this should go to Mr. Henderson, I would say that I
believe the gardeners of this country would gladly hail an-
other edition of 'Gardening for Profit.' at least, I thank
him for that little work. Through its influence I left a pay-
ing manufacturing business and began to follow its teach-
ings. This was three years ago. Now I have a market
garden of thirty acres and 400 four-foot sash, and enjoy my-
self as I never did before. Again I thank him."

ORANGE JUDD COMPANY,
245 BROADWAY, NEW YORK.

READ A STORY

ABOUT

CRANDALL'S ACROBATS.

We lately carried home a box of these amusing toys. A
deeply interested audience awaited the opening of the ex-
hibition. There were three little children, aged seven, five,
and two, respectively, and four big children, ranging from
twenty-nine to forty years of age. Little seven-year-old put
the acrobats together, aided by little five-year-old, while
little two-years gazed in wrapt admiration and enjoyment.
The excitement grew as the queer figures took shape and
assumed fantastic postures. Then big thirty-seven-year-old
tried his hand at the amusement, and very soon the merry
voices of old and young joined in a hearty laughing chorus
over the oddities of one of the most laughable and enter-
taining toys that we have seen for many years. It is a hap-
py hit, which will make the inventor's fortune, and is
nothing more nor less than wooden men in detail, the
bodies, heads, legs, and arms, separate, and so grooved that
they can be readily put together in an almost endless var-
iety of fantastic shapes and figures. They are colored as
acrobats, and as they perform feats never even attempted
at BARNUM'S, are fully entitled to their name. A pleasant
feature is their cheapness. The Orange Judd Publishing
Company, No. 245 Broadway, in this city, are the proprietors
of this "Great Show," which may be exhibited in every
home, and "no postponement on account of the weather."
From "The Christian at Work."

Price of "Crandall's Acrobats"—\$1 per box at 245 Broad-
way, or \$1.15 if sent post-paid.

ORANGE JUDD COMPANY,
245 BROADWAY, NEW YORK.

CRANDALL'S IMPROVED BUILDING-BLOCKS FOR CHILDREN.

BEAUTIFUL, AMUSING, INSTRUCTIVE.

CRANDALL'S Building-Blocks

Can be made into forms of almost endless variety.

The blocks are put up in neat, strong boxes, and
a large sheet giving various designs of buildings,
etc., accompanies each box.

Price—No. 1, \$2.00; by mail, prepaid, \$2.25.
No. 3, \$1.00; by mail, prepaid, \$1.10.
No. 4, \$1.00; by mail, prepaid, \$1.10.

CRANDALL'S Masquerade-Blocks,

Making 300 different and beautiful Combinations
of Pictures, which are in very brilliant colors.
They are not injured by washing, do not wear out,
and afford endless amusement.

Price \$1.00; by mail, prepaid, \$1.10.

CRANDALL'S Expression-Blocks,

With Letters on one side, Picture on the other.
The Alphabet is the key to the picture which, when
complete, represents the inventor in Dream Land.
These Blocks are water-proof, and can be washed
if soiled.

Price 50 Cts.; by mail, prepaid, 60 Cts.

CRANDALL'S Alphabet-Blocks.

Red, White, and Blue.

Tasteless, odorless, and water-proof. The letters
are on red, white, and blue ground. All children
are pleased with them.

Price 75 Cts.; by mail, prepaid, 85 Cts.

Crandall's Acrobats.

Full of fun and frolic, and most brilliant in costume.
These are among the most fascinating and ingeni-
ous toys ever invented. The number of figures
which can be made with the pieces in a single box
is limited only by the ingenuity of the operator.

Price \$1.00; by mail, prepaid, \$1.15.

N.B.—If postage is not remitted with the prices, as above,
the blocks will be sent by express at purchaser's expense.

Orders from the trade will be supplied on liberal terms.
